oncentration Camps, German

Prior to 1933 concentration camps had never been deliberately employed by a government to intimidate its own subjects. National socialism was the first totalitarian regime to use them as a major instrument for establishing control and for insuring its continuation in power. Because the camps were new inventions of the regime, no rules or regulations inherited from the German republic interfered with their organization. Moreover, they were relatively separated from the rest of German life and hence no interference from the population at large exercised its mitigating influence.¹

As central institutions of the government, their history followed closely that of the national socialistic state, and the changes they underwent reflected developments in the dictatorship itself. Whenever the regime felt threatened, the tool safeguarding it was used more viciously. As the regime expanded and encompassed all of Germany's life, the concentration camps increased also in size and purpose. They were then used for purposes not contemplated when first established. As time passed, the old types of concentration camps could no longer fulfil the various purposes assigned to them, and new types were developed. During the regime's decline, the camps reflected the disintegration and chaos of a regime which was no longer able to control even its central institutions of power.

At least three factors combined in influencing the history of the concentration camp: the history of the regime itself and the various needs it tried to meet by means of the concentration camps; the independent development of the concentration camps as institutions which followed a

logic inherent in the institutions as such, and, finally the counteractions of the prisoners.

Legally, the creation of the concentration camps was indirectly based on the German constitution, which in its article 48, sub 2, gave the president far-reaching emergency powers. These were used by Paul von Hindenburg in 1933 to promulgate a law whose purpose supposedly was to protect the state's security. On the basis of this law, legal grounds for the camps were introduced into the rules governing protective custody in a circular from the ministry of the interior of April 12, 1934. This circular decreed that persons sent to a concentration camp came under the jurisdiction of the gestapo and that their release was at its discretion. Later, courts decided that such prisoners had no access to courts.

The administration of the law for protecting people and state was entrusted to the secret state police, Geheime Staats Polizei, whose name was shortened to the use of the first two letters of each word and became known as the gestapo. The gestapo was not obliged to give public account of its activities, nor even to inform prisoners' relations as to whether their kin were still alive. It was staffed by the most trusted and fanatic followers of Hitler, the SS troops. Later, when the size of the SS expanded only its elite formations, the deathhead units (so called because of their insignia, a skull) administered the concentration camps.

At first only the political enemies of the regime were brought into the camps, and from among them only those who could not be prosecuted successfully in the courts of law. But soon others were included whose histories made it dangerous and therefore impossible, for the government to make public the grounds of their imprisonment.

As soon as the party was securely entrenched in power

¹This article was not intended to include in any great detail the statistics, living conditions, or over-all horror of the German concentration camp. It is, primarily, a first-hand analysis of behaviour in extreme situations created by a nation to make its citizens adopt the will of the state while continuing to believe that the state's will was, in truth, their own.—ED.

the situation changed, because then former leftwing radicals were no longer the most dangerous foes of the government. In 1934, the radical element within the party, including followers of Ernst Roehm, became the first party members to enter the concentration camps which some of them had helped to create.

The next group considered troublesome included those who opposed what was then the party's main task—the preparation for war. Therefore, pacifists, conscientious objectors and a so-called "work-shy" category of persons were sent to the concentration camps.

The ideology of the Germans as the superior race which became a central concept of the party, was soon reflected in the constituency of the camps. Persons who had sexual relations with members of the so-called non-Aryan race were either prosecuted in the courts or sent to the concentration camps. Later, when the party decided to prosecute them, homosexual prisoners were added since these persons had all committed so-called racial crimes, and were considered race-polluters.

In addition, defection and disobedience among the SS and within the party was even more dangerous to the regime than opposition outside of it. Therefore, the concentration camp came into use against restive party members themselves.

In the spring of 1938, there were hardly more than 50,000 prisoners in all German concentration camps; their number was probably smaller. At that time, the main camps were: Sachsenhausen (c. 8,000), Dachau (c. 6,000), Buchenwald (just started, c. 2,000), Esterwegen (c. 3,000) and small numbers in each of the several smaller camps such as Flossenberg. These figures did not represent the total number of political prisoners, because there probably were an additional 50,000 to 100,000 or more in the regular penal institutions, where they were treated pretty much as prisoners were treated in other jails. This was also true for Ravensbrueck, one of the rare concentration camps for women at that time. Most of the inmates in 1938 were political prisoners; the rest consisted of several hundred "work-shy" prisoners; a few hundred conscientious objectors, most of them Jehovah's Witnesses; not even 500 Jewish prisoners, many of them "race polluters"; a few socalled "incorrigible criminals"; and not even 100 prisoners who did not fall into any of those categories, such as former members of the French foreign legion who had returned to Germany and who were considered traitors because they had accepted service for a foreign power.

Within three months after the annexation of Austria, in 1938, the population of the concentration camp at Dachau, for example, increased from not quite 6,000 to more than 9,000. From then on, the population grew steadily at an ever-increasing rate. In obvious preparation for war, the gestapo tried to incarcerate or intimidate all those inhabitants of Germany who might become dangerous to the war efforts, which may explain why more and more Jews were brought into the camps or persecuted outside of them. Between Jan. 1938 and the beginning of World War II the population of the three biggest concentration camps, those at Dachau, Sachsenhausen and Buchenwald, increased from less than 20,000 to more than 60,000. At the same time the character of their population changed; the number of the asocial and criminal prisoners increased faster than that of political prisoners. The increase in the number of camps and their population was indicated by the fact that in 1944 it was estimated that there were approximately 100 concentration camps in

Germany with a population of from 200,000 to 350,000.

After the war began and particularly during the war, other types of concentration camps were established. First the slave-labour camps were added, with a purpose different from that of the original camps. They had to control slave labour and retain the benefit of its labour power, with the least possible expense for food, maintenance and pay.

Later, when the war was no longer going in Germany's favour, a last main type of concentration camp was created, the extermination camp. Its purpose was to dispose of prisoners in ways which would not necessarily come to the attention of the rest of the population and thus not be too upsetting to it, although such extermination on a small scale had been practised for some time.

The racial and eugenic notions of the national socialistic ideology exercised their influence on the camps as early as 1937. At that time, a few prisoners, not more than a dozen, mostly sex offenders and homosexuals, were sterilized. Later, beginning in 1940, prisoners who were incurably sick, particularly insane prisoners, were killed. Slowly then, the policy intended to improve the race was implemented in the camps by exterminating persons who were supposed to carry undesirable genes. While all exterminations were the result of racial dogmas, the use of the extermination camps on a big scale was probably not premeditated when such ideologies were first developed.

The first racial problem attacked on a large scale was that of the Jews, culminating in the large scale pogroms of 1938 and the sending of tens of thousands of Jews into the existing concentration camps. During the war, both the desire to execute the racial policy and the fear of the danger of having Jews living relatively uncontrolled in German cities spread. In preparation for the invasion of Russia, the German government was confronted with the problem of making sure that the large masses of Jews living in the annexed part of Poland and in those Russian areas which Germany planned to occupy (as well as Poles and Russians in those areas) would not constitute a possible danger to the communications between Germany and the Russian front.

Therefore, from Sept. 1939 on, a policy of decimation was inaugurated for the Jews as the enemies of the German people, for the Poles as the nation who might possibly threaten Germany's hegemony in the future, and for Russians on conquered ground. The tools used were inadequate food, hard labour, inadequate medical services and so on, but during these years actual violence was the exception.

This last step was inaugurated with the establishment of the extermination camps in 1942, starting at the time when Germany's power seemed greatest. Experiments with the gas chamber had started at the camp at Oswiccim near Cracow in Sept. 1941. Extermination was in full swing in July 1942; it was finally stopped in Sept. 1944 on orders from Berlin in the hope of thus gaining more favourable peace terms.

Each of the camps had its separate history, with better and worse periods, with emphasis on one rather than the other of the manifold purposes for which the camps were created and used by the gestapo. Thus, for instance, Buchenwald, from its founding late in 1937 until 1939, was the worst of all camps. But from 1942 until its total disintegration during 1944–45, it was one of the best. Therefore, all statements made below are only generally valid, but do not necessarily apply to each concentration camp at any particular moment of its existence.

Purposes of the Camps.—The concentration camps were

established and the acts of terror were committed in them as a means for obtaining varied results. Through their medium, the gestapo tried to change former opponents of the regime into docile subjects who would be unable to start, or to participate in, acts of resistance and would become willing to further the nazis' goals. At the same time the camps were used as experimental laboratories in which to determine how human beings might be transformed into slaves. Moreover, they could be used to ascertain what the minimal requirements were in regard to tood, shelter, clothing, hygiene and so on, required for keeping slave labourers alive and able to perform hard labour when the fear of punishment and death took the place of rewards. They were used to determine the maximum working hours per day which could be extracted, when no time was allowed for relaxation or family life. The gestapo used the camps to intimidate and to terrorize the rest of the population by letting it be known, in veiled form, what happened to those who opposed the nazi rulers. The prisoners were used as hostages for the good behaviour of their families and friends.

The camps also provided training places for the gestapo. There, the future gestapo man was to be educated to lose human feeling and kindness and become a "machine" ready to obey any orders, including the order to destroy human beings without mercy. At the same time, he could be convinced how dangerous it was to oppose the regime.

The camps were laboratories which permitted other types of experimentation with human beings which none had ever before dared to attempt. Finally, the camps were used for the destruction of at least many hundreds of thousands, if not millions of persons in line with the racial ideology of the national socialist party. This destruction was to ensure, as far as possible, that even after defeat the Germans would remain the most powerful nation in what German geopolitics called the "Heartland of Europe."

This article can not cover all these purposes and all the complex aspects of the institution which became known under the name "concentration camps." Since a selection was necessary, an effort was made to discuss in detail at least the first of the above mentioned purposes because it seemed the one aspect most likely to attain lasting importance. It was the problem of how formerly autonomous individuals could be changed into docile subjects.

Since the scientific literature on the camps was still very limited at the end of 1946, it may be mentioned how the material was collected. The author spent one year in the then two biggest German concentration camps, at Dachau and at Buchenwald. No records could be kept. The only way to collect and preserve information was to concentrate on the characteristic and otherwise outstanding phenomena and to memorize them. The prisoners were eager to talk about themselves and about what had happened in the camps. During the author's year in the camps, he worked in at least 20 different labour groups and slept in five different barracks. Thus he came to know at least 600 prisoners at Dachau and 900 at Buchenwald. Although only prisoners of the same category lived together in the barracks, they mixed at work. Thus the author was able to contact prisoners of all categories. After his release, he remained as much as possible in contact with prisoners and received several comprehensive reports on the experiences of former fellow prisoners who had spent all the time of the war at Buchenwald.

Organization of the Camps.—Within the camps, two main official hierarchies existed, that of the prisoners and that of the gestapo. Each of them was again subdivided into two subgroups, one pertaining to labour and one

to all other matters. Both hierarchies were headed by the so-called first camp commander, who was for all practical purposes the governor of the camp, and was under orders from the gestapo headquarters in Berlin. He was assisted by one or two commissioned officers, the so-called second and third camp commanders. They were the only commissioned gestapo officers in the hierarchy within the camp. Enlisted SS men were used only as guards. Although they, too, had power over the life and death of prisoners, according to regulations they had no function. Only noncommissioned officers were doing actual service within the confines of the camp.

Under the camp commanders were two otherwise fairly independent hierarchies. One was responsible for the prisoners' labour, and the SS noncommissioned officers of this hierarchy were called labour leaders; their head was the first labour leader. They were in charge of the prisoners while at work; they made out the work assignments and supervised their fulfilment. Under them was a hierarchy of prisoner foremen, called Kapos, with First Kapos at their head. They were in charge of the work details.

Another hierarchy was in charge of the prisoners while they were not at work; it was headed by the so-called rapport leader, who was in charge of counting the prisoners twice daily. Under him was a complicated gestapo hierarchy whose lowest member was the so-called block leader, a private first class or corporal who was in charge of a particular block, housing anywhere from 150 to 500, and in the last year of the war, even 1,000 prisoners. Under these gestapo noncommissioned officers was another hierarchy of prisoners, led by the so-called oldest prisoners of the camp ("oldest" was just a title attached to certain offices regardless of the time spent in the camp) who functioned as a kind of prisoners' police. Under them were the "oldest" prisoners of the barrack, followed by the "oldest" prisoners of the unit, and last and lowest, by the unit scribes.

Independent of these two hierarchies were others not subject to the orders of the camp commander but responsible to their own superior officers: they were the medical SS officers, the SS troops who guarded the prisoners and those who lived in the camp but were not under the camp commander's authority.

Thus some medical officers succeeded in protecting the prisoners once they came under their supervision in the camp hospital, even against the will of the camp commander. On the other hand, whether or not a prisoner was to be admitted to the camp hospital was up to gestapo men under the camp commander. Moreover, the medical officer was, after all, a colleague of the officers administering the camp; he lived within their circle and therefore preferred to co-operate rather than oppose. Nevertheless, the medical officers sometimes asserted their independence. For instance, on one terribly cold winter night the prisoners had to stand at attention for many hours. Many of them died of exposure, while several hundreds had their limbs frozen. At that time, the medical officer in charge of the camp insisted that the commander either shoot the prisoners or send them back to the barracks, because, as he put it, he could not be bothered the next day with hundreds of amputations, and he had neither the necessary help available to perform them, nor the quantity of bandages needed. On another occasion he insisted that the prisoners be given permission to wear mittens because several hundreds of them suffered from severe frostbite, and he felt unable or unwilling to perform all the needed amputations. The result was that those prisoners who

had money were permitted to buy mittens, at a great profit for the gestapo, who sold them to the prisoners at nearly five times their cost. On the other hand, when the medical experiments with human beings were inaugurated, the medical officers carried them out under orders from Berlin, and the camp commanders were in no position to refuse to provide the prisoners needed for such experiments.

As mentioned above, the camps also served as training grounds for future SS men. These trainees lived within the confinements of the SS camp adjacent to the prisoners' camp. They served as guards of the watchtowers and of the prisoners who worked outside of the camp. Such work details were always under the supervision of an SS labour leader, and the guards were supposedly only watching the prisoners, although they had the right to bring to the attention of the work leader those who according to their opinion did not work hard enough. Nevertheless, it was left pretty much up to the individual guard's fancy whether he wanted to torture a prisoner; if he felt like shooting one, he could always do so and claim self-defense or prevention of an escape. Besides these guards, a large number of other SS troops lived within the confinements of the SS camp who were not connected with the camp itself. They either did duty in the adjacent communities, or they were special troops stationed there, because they could draw on the slave labour of the camp for the services they needed.

Living Conditions.—The prisoners lived within an enclosure, surrounded by charged wire fences and moats, sometimes also by walls. The fences and the camp were controlled by regularly spaced watchtowers, on which machine guns and floodlights were installed. Any prisoner approaching the fence was immediately shot.

All prisoners had to wear uniforms of the type used in jails, and wore insignias, indicating the group of prisoners to which they belonged. A red triangle was worn by the political prisoners, a black triangle by those interned as asocial persons, etc. All Jews had to wear yellow triangles superimposed on other triangles indicating the subgroup among the Jews to which they belonged. In addition, each prisoner wore a sign with his prison number.

The proportion of prisoners of the various categories changed from camp to camp and from year to year. In 1944 it was estimated that at that time in all camps together the percentage of the various categories was approximately the following:

Asocial and "Work-shy"	38 %
Criminal	20 %
Political	18 %
Jehovah's Witnesses	8 %
Race Polluters	8 %
Emigrants	6 %
Homosexuals	2 %

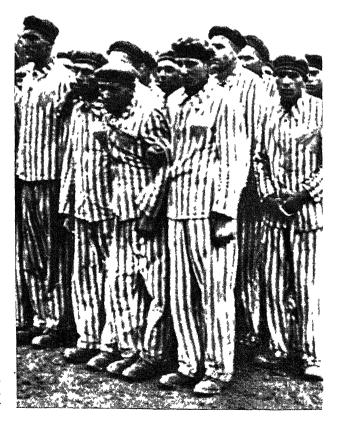

All prisoners were inadequately clothed, but nevertheless were exposed to heat, rain and freezing temperatures. Even worse, they suffered from extreme malnutrition. Before the war, the daily rations consisted of two cups of black ersatz coffee without sugar, 300 grams of low quality bread and two plates of thin vegetable soup, one at noon and one in the evening. The vegetables in this soup were mostly turnips. Occasionally the soup contained a few pieces of meat, mostly whale meat. The prisoners received, in addition, each day, one of the following: a herring, or a piece of sausage (usually prepared without meat) or two potatoes, or a piece of fatless cheese. They never received any fruit or fresh vegetables. Their

daily diet yielded less than 1,800 calories, while the labour the prisoners were forced to perform required a minimum average caloric intake of from 3,000 to 3,300 calories. An other serious hardship was the inadequacy of the water supply, which in some camps was so bad that the prisoners suffered continuously from thirst. Prisoners who had money could, up to 1939, supplement their diet by buying in the extremely expensive camp store. To be able to buy food there often meant the difference between life and death. This explains why wealthy prisoners usually were able to bribe others, and why bribery was so widespread. After 1939 the camp stores were discontinued in some but not all of the camps. Sometimes the prisoners were punished by having to go without food for a day or by being forbidden to buy at the store. During the war, this entirely insufficient diet was decreased considerably, particularly for the Jewish prisoners.

The prisoners had to perform the hardest types of labour despite suffering from malnutrition, exposure and the inability to keep themselves clean because of the lack of water and soap. Worst of all hardships was the anguish of not knowing how and when the tortures would end and of being separated from family and friends. A great additional hardship was the roll call twice daily on the parade ground during which the prisoners had to stand at attention. It sometimes lasted as long as six hours, because of the inefficiency of the gestapo men counting the prisoners and because of the continuously changing number of prisoners. In addition to all of these privations, the prisoners were denied all privacy.

It can be assumed that the death rates in the camps were set by the central office in Berlin. Sometimes gestapo headquarters ordered the governor of the camp to execute

Roll call at a German concentration camp (from a nazi photograph). Two prisoners in the foreground are supporting a comrade, as fainting was frequently an excuse for the guards to "liquidate" useless inmates

all prisoners of a certain group. At other times the governors were ordered to stop executions which had already started. When an extermination order arrived, the supervisors or even the commander of the camp frequently tried to protect certain prisoners who were important to him because of their help in running the camp. This they did by transferring them into another group, not yet selected for extermination. Thus it seemed important for a prisoner to make himself irreplaceable to the gestapo. But this also entailed its dangers. Those who knew too much were killed in time to prevent their revealing what the gestapo wanted to keep secret.

The Disintegration of Personality

The national socialistic state could feel secure only if a childlike dependency and obedience of all subjects were assured to the interests of the supreme state. In order to create and maintain these childlike attitudes in adults, it was necessary to inhibit the higher integration of their personalities and their individualization and individual autonomy—the most dangerous enemy of the mass state.

In the child, nothing promotes growth toward higher integration more than success in independent action; fear of punishment often forces the child to give up all efforts directed toward greater independence and integration. While Hitler was in power the German citizen continuously lived in fear. He was threatened by extremely severe punishment if he dared to transgress orders, if he acted independently from the will of the father figure, the fuehrer. The national socialist state paid the highest reward for blind obedience to the fuehrer's authority. It withheld reward from independent efforts. Thus there was a premium on remaining on, or regressing toward a lower level of integration. The fear of punishment prevented nonintegrated persons from engaging in those independent experiences through which they might have gained ego strength and personality integration. It forced many to regress to a lower level of integration than had been previously reached so as to be able to give up dangerous autonomy in favour of safer obedience.

Individuals who successfully resisted the imposed mass living and therefore protected themselves against a regression into childlike dependency on a supposedly all powerful and omniscient father figure were dangerous to the regime, and hence, stronger methods of control were necessary to reduce them to embracing dependent behaviour similar to that of the rest of the population. The method of accomplishing this was the concentration camp.

Traumatization.—Whether or not being deprived of one's civil rights and unlawfully locked into a prison was experienced as a traumatic shock depended on the individual's personality. Nevertheless, if one wished to generalize, the prisoners' reactions could be analyzed on the basis of two categories: the socio-economic class to which they had belonged and their political education, although these categories frequently overlapped.

The nonpolitical middle class prisoners were the group most strongly traumatized by the experience of being imprisoned. They could not understand what had happened to them and why. They had always obeyed all orders of the authorities and therefore could not understand their persecution. Although unjustly imprisoned, they did not dare oppose their oppressors even in thought, although this would have given them self-respect of which they were at this moment so badly in need.

Their behaviour illustrated the conflict in which the respectable but politically uneducated German middle classes found themselves when confronted with the phe-

nomenon of national socialism. No consistent political or social philosophy protected their integrity as human beings and permitted them to oppose national socialism. Their self-esteem had always been based predominantly on the respect they enjoyed because of the character of their office, the outward honour paid to them as heads of their families, and other similar external factors which gave them status.

Members of this group were the first to disintegrate as autonomous persons. Suicides were mostly confined to their numbers. Many of them became antisocial; they resorted to bribery, cheating, stealing and even turned spies in the service of the gestapo (which did not help them, because the gestapo liked the betrayal, but despised the traitor).

Nearly all of these prisoners lost their desirable middle class characteristics, such as their sense of propriety and self-respect. In their stead, they developed to an exaggerated degree the undesirable characteristics of this group, such as pettiness, quarrelsomeness and selfishness. They became depressed, shiftless and complained eternally. They no longer seemed able to follow any life pattern of their own and seemed to exchange it for those developed by other prisoners which they copied.

Political prisoners had expected to be persecuted because of their political activities. They were less traumatized by their imprisonment because it did not come unexpectedly; they had anticipated it and thus were psychologically prepared for it.

They were fearful about their own fate and that of their families and friends.

Former criminals enjoyed finding themselves on an equal basis with persons who had been prominent politically, socially or economically. In their case imprisonment in itself did not constitute a strong enough traumatization for starting them on the process of personality change and disintegration. The same was true for the asocial prisoners. All prisoners were exposed to a severe traumatization during their transportation into the camp and during the first weeks in the camp itself.

Adjustment to the Camp.—The attitude of denying "reality" to experiences which were so extreme that they threatened the prisoner's personality integration was a first step toward developing new mechanisms needed for surviving in the camp. By denying reality to overwhelming situations these became somehow bearable, but at the same time this attitude already constituted a major change in experiencing the world. Thus, while this attitude was a necessary adjustment, it implied at the same time a personality change. The denial of reality was most obvious in extreme experiences which otherwise could not be managed.

The psychological reactions to events which were somewhat more within the sphere of the normally comprehensible were decidedly different from reactions to extreme experiences. Prisoners dealt with less extreme events the same as if they had happened outside the camp. For example, if a prisoner's punishment was not of an unusual kind, he seemed ashamed of it, and tried to conceal what had happened. If a prisoner was slapped in his face, it was more upsetting and embarrassing to him than if he had been whipped. Prisoners hated guards who had kicked, slapped or verbally abused them much more than they did guards who had wounded them seriously. In the latter case, the prisoner hated the gestapo as such, but not so much the individual who had inflicted the punish-

ment. Obviously this differentiation was unreasonable, but it seemed to be inescapable. Prisoners felt deeper and more violent enmity against particular gestapo members who had committed minor vile acts than they felt against those who had acted in a much more terrible fashion. An example may illustrate this: A gestapo man asked a prisoner to explain something to him. In doing so the prisoner forgot the rule that in the presence of a gestapo man he had always to stand at attention, and he bent over the desk. The gestapo officer thereupon slapped his fingers with a ruler he was holding in his hand. This slap was hardly a severe punishment when compared to those to which prisoners were exposed. Nevertheless, it upset the prisoner considerably. The reason for his strong reaction was that the event was too closely associated to what had happened to him in childhood. Therefore, it was an event which he had to accept in its entirety as real. Since it happened to him as an adult, it was unbearable.

The following interpretation of this phenomenon is tentative. It seems that experiences which might have happened during the prisoner's "normal" life history provoked a "normal" reaction. Prisoners seemed, for instance, particularly sensitive to punishments similar to those which a parent might inflict on his child. To punish a child was within their "normal" frame of reference, but that they should become the object of the punishment destroyed their adult frame of reference. So they reacted to it not in an adult, but in a childish way-with embarrassment and shame, with violent, impotent and unmanageable emotions directed not against the system, but against the person inflicting the punishment. A contributing factor might have been that the greater the punishment, the more the prisoner could expect to receive friendly support which exerted a soothing influence. Moreover, if the suffering was great, he felt more or less like a martyr, suffering for a cause, and the martyr is supposed not to resent his martyrdom.

Martyrdom is, in some ways, the highest assertion of individuality. It was, therefore, contrary to the gestapo ideology to permit prisoners to gain prominence through martyrdom. Since all were exposed to tortures, those who died under such tortures, although they were martyrs to their political conviction, were not considered martyrs by the other prisoners. Only those who suffered from their efforts to protect other prisoners were accepted as martyrs. The gestapo was usually successful in preventing the creation of martyrs through its anti-individualistic ideology, on the basis of which any individual action was suppressed or changed into a group phenomenon.

The prisoners as a group developed a resentment against minor sufferings. Not only did they not offer any help; they blamed the prisoner for having brought about his own suffering by his stupidity, by not having made the right reply, by having himself get caught, by not having been careful enough. In short, they accused him of having behaved like a child. So the degradation of the prisoner by means of being treated like a child took place not only in his own mind, but also in the minds of his fellow-prisoners. This attitude extended to small details. Thus, for instance, a prisoner did not resent being cursed by the guards during an extreme experience, but he hated the guards for similar cursing when it occurred during some minor mistreatment.

As time went on, most prisoners showed little difference in their reactions to minor or major sufferings because most of them had by then reached a stage of personality disintegration which seemed to indicate that the gestapo's effort to change them into docile, de-individualized and dependent subjects had succeeded.

Besides traumatization, the gestapo used mainly two other methods of disintegrating the prisoners as individuals; forcing them to become members of a mass rather than remaining autonomous individuals, and forcing them to adopt childlike behaviour.

Mass Behaviour.—Whenever possible, the prisoners were punished as a group; thus the whole group suffered with the individual who had brought the punishment about. The gestapo used this method probably because it was in line with its anti-individualistic philosophy and because it hoped that in this way the group would control the individual. It was in the group's interest to prevent the individual from endangering the group. Since the fear of punishment was, even in the concentration camp, more frequent than actual punishment, the group asserted its power over the individual more often and more effectively than the gestapo could.

Following the escape of two men from Buchenwald in 1938, the punishment imposed on all prisoners was that they could not receive meals but had to stand at attention until the fugitives were found. The prisoners knew that this was not an empty threat because on a previous similar occasion they had been forced to stand at attention for nearly 40 hours; but then it had been summertime while now it was an extremely cold winter evening with a blizzard in the offing. After more than 20 prisoners had died of exposure, the discipline broke down, because the mental attitude of most prisoners changed. Whereas before they had feared for themselves and had tried to protect themselves as well as possible, they now became depersonalized. It was as if giving up individual existence and becoming a member of a mass seemed in some way to offer better chances for survival, if not for the individual, at least for the group. To be exposed to the weather was a terrible torture; to see one's friends die without being able to help and to stand a good chance of dying, created a situation which obviously the individual as an individual could not meet successfully. Therefore, the individual as such had to disappear in the mass. The prisoners felt that what happened to them did not "really" happen to a "one." There was psychologically, and in experience, a split between the "figure" to whom things happened and the prisoner himself who did not care what happened to this figure and who was more or less a detached observer of events. Unfortunate as the situation was, the prisoners then felt free from fear as individuals and powerful as a mass because "not even the gestapo can kill all of us to-night." Therefore, they were actually happier than at most other times of their camp experiences, because they were relatively free from fear for themselves. They did not care whether the guards shot them; they were indifferent to acts of torture. The guards no longer had any authority; the spell of fear and death was broken. When this stage was reached, a quasiorgiastic happiness spread among the prisoners, who by forming a mass had thwarted the gestapo's effort to break them.

The gestapo's enforced control of the group over the individual prisoner also had its counterpart in the prisoner's self interest and thus made group control nearly inescapable. The treatment to which the prisoners were exposed filled them with justified rage. To give vent to it meant almost certain death. The group helped the individual to restrain himself.

Adopting Childlike Behaviour.-To be filled with im-

potent rage is a situation frequent in childhood, but disastrous for a maturely integrated ego. Therefore, the prisoners' aggressions had to be dealt with in some way, and the only safe way was to turn it against the self. This method increased masochistic and passive-dependent and childlike attitudes, which were "safe" because they prevented conflicts with the gestapo. The psychological mechanism inside the prisoner again coincided with the gestapo's effort to produce childlike dependency.

The prisoners were often tortured in ways which cruel and domineering fathers might adopt to torture helpless children. They were also debased by techniques which went much further into childhood situations. They were forced to soil themselves. Defecation was strictly regulated; it was one of the most important daily events, discussed in great detail. Prisoners who needed to eliminate had to obtain permission of a guard and to report to him on their return from the latrine. It was as if the precepts of cleanliness were once more being repeated. It gave the guards pleasure to hold the power of granting or withholding permission to visit the latrines. This pleasure found its counterpart in the pleasure the prisoners derived from visiting them, because there they could rest for a moment, relatively secure from the whips of the overseers and guards, although sometimes enterprising guards enjoyed interfering with the prisoners even there.

The prisoners were forced to say "thou" to one another, which in Germany is indiscriminately used only among small children. On the other hand, they had to address the guards in the most deferential manner, giving them all their titles.

Another influence contributing to the regression into childhood behaviour was the work the prisoners were forced to perform. New prisoners, particularly, were forced to perform nonsensical tasks, such as carrying heavy rocks from one place to another, and after a while back to the place where they had picked them up. They were forced to dig holes in the ground with their bare hands, although tools were available. They resented such nonsensical work, although it ought to have been immaterial to them whether their work was useful. They felt debased when forced to perform "childish" and stupid labour, and preferred even harder work when it produced something that might be considered useful. They felt even more debased when they were hitched like horses to heavy wagons, called "bog-express" (Moor Express) because they were first used by the "peat-bog" soldiers. Depending on the wagon's size, from 8 to 24 prisoners had to draw these heavy loaded wagons under the whips of the foremandriver, who often forced them to gallop.

The gestapo frequently assigned more meaningful tasks to "old" prisoners. This indicated that forcing prisoners to perform nonsensical labour was a deliberate effort to speed up their disintegration from self-respecting adults to obedient children. How these efforts succeeded could best be illustrated by comparing the behaviour of "new" prisoners in whom the process of reduction to citizenship in a gestapo-controlled microcosm had barely begun with "old" prisoners in whom it was nearly concluded.

Changes in "Old" Prisoners.—The term "new" prisoners was used for designating those who had not spent more than one year in the camp; "old" prisoners were those who had spent at least three years in the camp. There was, of course, considerable variation among individuals in the time it took them to adjust to life in the camps and become "old" prisoners. Some became a part of the camp life rather soon. A very few never made the adjustment, although some spent more than ten years in the camps.

The main concern of the new prisoners was to remain integrated as persons, so as to be able to return to the outer world as they had left it; all efforts, therefore, were directed toward this goal; an attempt was made to combat regression into childlike dependency. Old prisoners were mainly concerned with the problem of how to live as well as possible within the camp. Therefore they tried to integrate their personalities, as well as was feasible, on a level acceptable to the gestapo. Once they had embraced this attitude, everything that happened to them, even the worst atrocity, was "real" to them. No longer was there a split between a figure to whom things happened and the prisoner who detachedly observed what happened to this figure. The split in personality had disappeared, but the prisoner's personality was now integrated on a different and lower level; it was one of resignation, dependency, submission and passivity. The old prisoners were able to achieve this integration on a low level because they hardly believed they would ever return to the outer world, which had become strange to them. Once they had changed thus, they were afraid of returning because they doubted that they would be able to adapt to life in a free world. They seemed aware of what had happened to them while growing older in the camp. They realized that they had adapted themselves to the life in the camp and that this process was co-existent with a basic change in their personality.

Indicative of the acceptance of camp life as real was the tendency to scheme in order to find a better place of work in the camp, rather than to try to contact the outer world. New prisoners would spend their money on efforts to smuggle letters out of the camp or to receive communications without having them censored. Old prisoners did not use their money for such purposes. They used it for securing "soft" jobs, such as clerical work in the offices of the camp or labour in the shops where they were at least protected against the weather. This change also found its expression in a change in the prisoners' preponderant thoughts and topics of conversation; new prisoners were most concerned with their families and life outside of camp, while old prisoners were interested only in camp life. It so happened that on a single day news was received of a speech by President Roosevelt, denouncing Hitler and Germany, and rumours spread that one officer of the gestapo would be replaced by another. New prisoners discussed excitedly the president's speech and paid scant attention to the rumours. Old prisoners paid little attention to the president's speech, but devoted nearly all their conversations to the rumoured change in camp officers.

The old prisoner's attitude toward his family underwent a significant change. One of the reasons was the change in status from leadership to dependency. Now he was not only unable to influence his wife or children, but was utterly dependent on them to take steps to secure his release, and to send him all-important money. At first, most families behaved decently toward the prisoners. They spent a great deal of money in efforts to free them, often more than they could afford. But later on they ran out of funds. Wives found difficulties in finding employment because a family member was suspect; they could not receive unemployment compensation unless they divorced their husbands. Their children had difficulties at school; they were excluded from joining any of the many youth organizations. So it was only natural that they came to resent having a family member in the camp. These and similar attiQ

tudes were reflected in letters from home, if any.

Prisoners were not permitted to possess any pictures of their relatives. Thus, as time passed, recollections of their families grew dimmer, and the strongest bond which had kept them connected with the outside world grew weaker. The resentment of those who, rightly or wrongly, felt themselves deserted by their families, worked in the same direction. The less they received emotional support from the outside the more they were forced to adjust to life in the camp. Therefore, old prisoners did not like to be reminded of their families and former friends. When they spoke about them, it was in a very detached way. A contributing factor was the prisoners' hatred of all those living outside of the camp, who "enjoyed life as if we were not rotting away."

New prisoners always loved to speak about their relatives and friends even when they were complaining about them, and accusing them of not exerting themselves enough in helping them. They liked to talk about their position in the outside world and to paint it in the most glowing colours. They embarked also on long discussions of their hopes about their future after liberation. They seemed to be backing their self-esteem by letting others know how important they had been.

There was a marked difference between the daydreams of the new and the old prisoners. The longer the time a prisoner had spent in the camp, the less true to reality were his daydreams; so much so that the hopes and expectations of the old prisoners often took the form of eschatological or messianic hopes. They would daydream of the coming world war and world revolution; they were convinced that out of this great upheaval they would emerge as the future leaders of Germany at least, if not of the world. This was the least to which their sufferings entitled them. These grandiose expectations were co-existent with great vagueness as to which talents or achievements would justify such hopes. The daydreams were partly a countereffort, denying permanently the prisoners' state of utter dejection. They felt that only the highest external social status could help them regain self-respect and inner security.

One more feature of regression to infancy or early youth should be mentioned. The prisoners lived, like children, only in the immediate present; they lost the feeling for sequence of time; they became unable to plan for the future or to give up immediate pleasure satisfactions to gain greater ones in the near future. They were unable to establish durable object-relations. Friendships developed as quickly as they broke up. Prisoners, like adolescents, would fight one another tooth and nail, declare that they would never even look at one another or speak to one another, only to become close friends within a few minutes. They were boastful, telling tales about what they had accomplished in their former lives, or how they had succeeded in cheating foremen or guards. Like children, they felt not at all set back or ashamed when it became known that they had lied about their prowess.

Final Adjustment.—The result of all these personality changes was a personality structure willing and able to accept gestapo values and standards of behaviour as their own, although opposed to their own interests.

The national socialist race ideology and German nationalism were seemingly the easiest to accept. They were soon embraced even by formerly well-educated political prisoners. At one time, for example, U.S. and English newspapers reported the cruelties committed in the camps.

The gestapo punished the prisoners for the appearance of these stories, in accordance with their policy of punishing the group for whatever a former member did, (since the stories could have originated only in reports of former prisoners). In discussions of this event, old prisoners insisted that it was not the business of foreign newspaper correspondents to bother with internal German institutions. When more than 100 old political prisoners were asked in 1938 whether they thought that the story of the camp should be reported in foreign newspapers, many hesitated to agree that this was desirable. When they were asked whether they would participate in a war on the side of a foreign power to defeat national socialism in Germany, only two made the unqualified statement that everyone escaping Germany ought to fight the nazis to the best of his abilities.

Nearly all non-Jewish prisoners believed in the superiority of the German race. Nearly all were full of pride in the so-called achievements of the national socialist state, particularly its policy of expansion through annexation. In line with their acceptance of the racial ideology, most old prisoners took over the gestapo's attitude toward the so-called unfit prisoners.

Newcomers who did not stand up well under the strain tended to become a liability to the others. Moreover, weaklings were those most likely to turn traitors eventually. Therefore, old prisoners were sometimes instrumental in getting rid of the so-called unfit new prisoners, in this way making one feature of gestapo ideology a part of their own behaviour. This was done by giving new arrivals dangerous assignments, or by denying them help that could have been given.

Thus old prisoners moulded their way of treating other prisoners according to the example set by the gestapo. Another method was their treatment of traitors. Self-protection demanded their elimination, but the way in which they were tortured for days in the most horrid fashion and slowly killed was taken over from the gestapo. Here the excuse was that the act might deter others from turning traitors, but the rationalization could not be applied when prisoners turned their hostility against one another as they did continuously. Only their self-identification with the gestapo could explain why they used the gestapo's vocabulary, a vocabulary which they never had used before imprisonment. From copying the verbal aggressions of the gestapo to copying their form of bodily aggression was one more step which usually took several years. Old prisoners, and not only the criminals, often behaved worse than the gestapo.

Old prisoners tended to identify themselves with the gestapo not only in respect to aggressive behaviour. They tried to arrogate to themselves old pieces of gestapo uniforms. If that was not possible, they tried to sew and mend their uniforms so that they would resemble those of the guards, although the gestapo punished them for their efforts. When questioned, they admitted that they liked to look like one of the guards.

Old prisoners obtained great satisfaction, during the twice-daily counting of the prisoners, in standing well at attention, and at giving a snappy salute. This can be explained only by their having entirely accepted, as their own, the values of the gestapo. Prisoners also prided themselves on being as tough, or tougher than gestapo members. Self-identification with their torturers went as far as the copying of their leisuretime activities. One of the games played by the guards was to find out who could stand to be hit longest without uttering a complaint. This game was copied by old prisoners.

Gestapo officials recording data on incoming prisoners at a German concentration camp. Those waiting to be questioned are seated on the ground (left) under guard

Often the gestapo would enforce nonsensical rules, originating in the whims of one of the guards. They were usually forgotten as soon as formulated, but there were always some old prisoners who would continue to follow the rules and try to enforce them on others long after the gestapo had forgotten about them. Once, for instance, a guard on inspecting the prisoners' apparel found that the shoes of some of them were dirty on the inside. He ordered all prisoners to wash their shoes inside and out with water and soap. Treated this way, the heavy shoes became hard as stone. The order was never repeated, and many prisoners did not even execute it when given. Nevertheless, some old prisoners not only continued to wash the inside of their shoes every day but cursed all others who did not do so as negligent and dirty. These prisoners firmly believed that the rules set down by the gestapo were desirable standards of human behaviour, at least in the camp situation.

Among the old prisoners one could observe other developments which indicated their desire to accept the gestapo along lines which could never have originated in propaganda. Since their return to a childlike attitude toward the gestapo, they apparently had desired that at least some of those whom they accepted as all-powerful father images should be just and kind, and therefore, strange as it may seem, they had also positive feelings toward the gestapo. They divided their positive and negative feelings. All such positive emotions were concentrated on a few officers who were well up in the hierarchy of the camp administrators, but rarely on the governor of the camp. Prisoners insisted that these officers hid behind their rough surfaces a feeling of justice and propriety. They were supposed to be genuinely interested in the prisoners and even trying, in a small way, to help them. Since these supposed feelings never became apparent, it was explained that they had to hide them effectively, lest they become unable to help the prisoners. A whole legend was woven around the fact that of two officers inspecting a barracks, one had cleaned his shoes before entering. He probably did it automatically, but it was interpreted as a rebuff to the other officer and a clear demonstration of how he felt about the concentration camp.

Although much has been said about the old prisoners' tendency to conform and to identify themselves with the

gestapo, this was only part of the picture. All prisoners, including the old prisoners who identified themselves with the gestapo in many situations, defied the rules of the gestapo. In doing so, they occasionally demonstrated extraordinary courage, and many of them retained this courage and integrity all during their stay in the camps.

Psychological Defenses.—Even sooner than prisoners' organizations could be formed, each prisoner mustered his psychological defenses for protecting himself against the traumatic experiences to which the concentration camp subjected him.

The politically-educated prisoners found support for their self-esteem in the fact that the gestapo had singled them out as important enough to be objects of revenge. The members of different parties relied on different types of rationalization for thus buttressing their egos. Former members of radical-leftist groups found in the fact of their imprisonment a demonstration of how dangerous for the nazis their former activities had been. Former members of liberal groups argued that now it could be seen that they had been unjustly accused of a middle-of-the-road policy, since their imprisonment clearly demonstrated that the policy which they had advocated was what the nazis feared most, as could be seen from their imprisonment. Similar rationalizations were used by the comparatively few members of conservative groups, such as Catholics or monarchists, who felt their imprisonment as strongly as did members of the middle classes. But the high esteem in which they had been held before their imprisonment helped them to deny for some limited time the "reality" of what had been happening to them. They were still convinced of their exceptional position and therefore believed that they did not need to adjust to the camp; they believed they would soon be released because of their importance for society. This conviction was instrumental in forcing some middle class prisoners into the dependency of upper class prisoners because they hoped that they would help their former middle class "clients" to gain liberty after their release. Upper class prisoners therefore did not usually form a group, because each of them was surrounded by a group of middle class "clients." They could maintain their superior position only as long as there was some reason to believe in their speedy release and as long as they were able to distribute money freely. When time passed and experience convinced them and their clients that they were no better off in regard to re-

lease than were all other prisoners, their special status could not be maintained, and there was no longer any difference between them and other prisoners.

This was not equally true for the very few upper-upperclass, the formerly "anointed" prisoners. They neither collected "clients," nor were they as ready to use money for buying the favour or services of other prisoners; nor did they discuss their expectations of release. Their number was too small to permit any generalizations; they were mostly members of former royal families. They looked down on all other prisoners nearly as much as they despised the gestapo.

In order to endure life in the camp, they seemed to develop such a feeling of superiority that nothing touched them

It has been mentioned that one of the safeguards against personality disintegration was the strength of the ties which bound a prisoner to his family. The more important these ties were, the greater was the fear that they might be broken. A letter from home telling of efforts to liberate them brought tears of joy and remorse. But they might curse in the next moment when learning that some of their property had been sold or some other important decision made without their permission. They would then swear at their families, which "obviously" considered them "already dead." Even the smallest change in their former private world attained tremendous importance. They might have forgotten the names of some of their best friends, but on learning that the friends had moved, they were terribly upset. This ambivalence of the prisoners in relation to their families seemed to be due to their desire to return as exactly the person who had left.

Because they frequently forgot names and places, prisoners often feared they were losing their memories and intellectual capacities. The fear was enhanced by realization that they could no longer reason objectively. They knew that they were continuously swayed by emotions, particularly by their anxieties. This led to efforts to retain and cultivate their memories, often by attempts to recall what they had learned in school. Interestingly enough, they were best able to recall things they had learned by rote-facts which were disconnected with anything that may have had bearing on their existing life situations. They tried, for instance, to demonstrate the strength of their memories by repeating the names of the German emperors, the dates of their ascendency to the empire, the names of the popes and similar facts which they had memorized years before in class. Their efforts led to regressions into childhood situations, into automatic rather than spontaneous actions.

It has been mentioned that prisoners resented being forced to embark on nonsensical labour, that to be forced to do such labour contributed to their personality disintegration. Here the reverse may be discussed. In order to gain self-respect, prisoners tried to work well. Various rationalizations were used as justification, such as that the prisoners' work served the German people as a whole and not only the gestapo, or that it was important to work well in order to feel like a "real man." Some declared that by working hard one could convince the guards that the prisoners were not the scum of the earth, as the gestapo claimed.

Prisoners making the last type of statement were very close to indentifying themselves with the gestapo, since they looked to the guards for gaining prestige. But the

psychological reasons for the previously mentioned attitudes were manifold. By working well, a prisoner might have actually saved his life, and his self-respect might have been truly enhanced by his ability to work well. On the other hand, by adopting such attitudes, the prisoners were thrown into the conflict of having to serve the gestapo well in order to gain self-respect. This, in turn, was even more detrimental to their self-respect because it meant serving well those whom they despised, and who in turn despised them.

Intimidation of Civilians; Hostages

When the concentration camps were established, the gestapo detained in them their more prominent foes. Soon all prominent enemies were eliminated, because they were either dead, in jail, in the camps or had emigrated. Still, an institution was needed to threaten the opponents of the system. To imprison all of them would have interrupted the functioning of industrial production, the upholding of which was a paramount goal of the government. Therefore it seemed expedient to select a few members of a group which had become dissatisfied with the regime and to send them into the camps. For instance, if lawyers became restless, a few hundred lawyers were sent to the camps; the same happened to physicians when the medical profession seemed rebellious, etc. The gestapo called such group punishments "actions."

The new system was first used during 1937-38, when Germany was seriously preparing to embark on the annexation of foreign countries. During the first of these "actions," only the leaders of the opposition group were punished. The feeling thus arose that it was not dangerous to belong to a restive group as a mere member. Therefore, the gestapo revised its system and selected the persons to be punished so that they represented a cross section through the different strata of the dissatisfied group. This new procedure had the advantage of spreading terror among all members of the group. It also made it possible to punish and destroy the group without necessarily touching the leader if that was for some reason inopportune. At one time, for instance, a movement opposed to the government's regimentation of cultural activities centred around the person of the famous conductor Wilhelm Furtwaengler, although he himself did not take a stand on the issue. He was never threatened, but the group was destroyed by the imprisonment of a cross section of its members. Thus even if he had taken part in the movement, he would have found himself a leader without followers, and the movement would have subsided.

The best defense against the threat of being sent to the concentration camps was to obey blindly. Such automatic obedience asked for a denial of the values held previously and requested far reaching identification with national socialism. Those Germans, and there were many of them, who were unable or unwilling to make this identification could only hope not to be found out. Their attitude may be characterized by a jingle which was widely and fearfully quoted. It goes: "Dear Lord, make me dumb so that I do not have to go to Dachau." ("Lieber Gott, mach' mich stumm, Dass ich nicht nach Dachau kumm'.") Even more characteristic than the jingle itself was the example which it copied—the first rhymes taught to nearly every German child: "Dear Lord, make me devout, so that I will go to heaven."

Hostages.—The desire to force individuals to behave as the government wished them to behave out of their own will and in order to protect the fate of their kin was the openly admitted purpose of the hostage system. The gestapo never told the prisoners for how long they would have to remain in the concentration camp. The same was true of prisoners' relations. They were encouraged to inquire repeatedly in respect to the prisoners' release, whether or not they were permitted to send letters or money and for many other reasons.

Each of these visits to the gestapo office was a terrifying experience for the inquirer, because any wrong move might endanger himself, as well as the prisoner on whose behalf he intervened. In addition, the gestapo informed relatives that their own behaviour influenced the length of time the prisoner had to remain in the concentration camp. And if this would not have been sufficient, they also told them that the prisoner's release would depend on the behaviour of groups or on events which were entirely beyond the relatives' power to influence. Thus, at one time relatives were told that no prisoner would be released from Dachau unless all foreign newspaper stories about the atrocities committed in the camp were discontinued.

Training Centres for the Gestapo

The SS men, as previously stated, were at first recruited from among the old and tried followers of Hitler-individuals who had been hardened during the time of the street fights with the communists. But their ranks were not numerous enough to fill the big organization of the SS. Moreover, many of them moved to higher positions and had to be replaced by comparatively untried recruits, while others were no longer reliable followers of Hitler after the status of the party had changed from one of revolutionary fervour to one of supporting a well-established government. Up to 1936, probably the local gestapo was in charge of the camps. In 1936, the supervision of all camps was unified, and the position of a leader (commander or inspector) of all SS deathhead formations and concentration camps was created. Theodor Eicke was appointed to this position, in which he remained for a long time. He was responsible only to Heinrich Himmler. In 1937 he and his staff established their headquarters outside the concentration camp of Sachsenhausen, near Berlin. In 1938, the SS troups were reorganized into three large units. The most reliable SS men formed Hitler's bodyguard which was also held ready for special assignments, hence its name SS Disposition units (SS Verfuegungstruppe). Second in reliability came the SS deathhead units, whose main assignment for some time was the guarding of the prisoners in concentration camps. Finally there was the general SS (Allgemeine SS). During the war emergency, reliable SS troops were needed at the front; therefore, the SS deathhead units were used to form the SS deathhead tank division; nevertheless they still remained in charge of the concentration camps.

Before the war, every SS recruit had to serve at least another three months' postbasic training period during which he guarded concentration camp prisoners. How well he proved himself during this training was often decisive of whether he became a member of the deathhead units, or only of the general SS, or was discharged. During World War II, there were no longer enough volunteers for available SS positions, and from then on the gestapo was forced to accept SS recruits who were by no means typical SS material. Therefore the following discussion pertains mostly to the situation before and during the first years of the war.

When discussing the influence the camp experience had on the guards, their background should be considered. The new recruits who received their training in the camps were not old party members, but by now were at least noncommissioned officers training the recruits. Nor were they persons who had succeeded in their professions because then they would have continued in them. Very few of the guards were young men who previously had been permanently unemployed. These had belonged to the lumpen proletariat and had long since joined either the National Socialist party or the communists. Thus they were now either old party members or ineligible. The SS guards were not recruited from among the small shopkeepers, artisans, petty white collar workers or farmers themselves who had been the mass following of the National Socialist party, but they were their younger sons. In Germany usually the oldest son inherited the farm, or the shop, while his younger and therefore "disinherited" brothers had to look out for themselves as well as they

Thus the typical SS guard was the "squeezed out" son of a father who himself had been squeezed out of his former relatively comfortable economic position by the political and economic consequences of World War I and technological progress.

It was a group whose self-respect was very low to begin with.

The strict obedience which they had to observe towards their superiors and the hardships of their basic training added to their feeling of resentment. Moreover, not all Germans showed them the respect which they had hoped would be their due as soon as they donned the black uniform of the SS. True, nearly everybody feared them—a reaction which at one time was so strong that the guards of the camp Buchenwald were called "the killerboys" in the nearby city of Weimar, a stronghold of national socialism. At that time no self-respecting girl dated the guards. It took some special pressure and propaganda to combat their social ostracization.

Their past disappointments and the existing frustrations of the guards would have led them to look for scapegoats against whom they could turn their aggressions even if the prisoners had not been available. To this was added the fear and suspicion which the uneducated German had of the intelligentsia. While the guards were partially master of the life and death of prisoners, they were continuously afraid of being "found out" as unintelligent and incompetent. This created in them a very uncomfortable feeling, and some guards were even jealous of the prisoners. Cruelty was not always the result of complicated psychological processes. It was frequently exercised to avoid suspicions of disloyalty in the minds of their superiors. Also, because of the internal organization of the camp, contacts with some prisoners were unavoidable. Through them the gestapo men learned that the prisoners were neither as dangerous nor as vile as had often been thought. Then a few gestapo men tried to change their behaviour. But this put them into a precarious position because they were accused of fraternization. Therefore they had to continue to remain brutal, and their sense of uneasiness and guilt grew. From then on much of their brutality had the character of denying that they felt guilty or were afraid of their own actions.

Many of the rules and regulations which the gestapo introduced into the life of the concentration camps seemed farcical on casual inspection. Their real purpose was not so much to regulate the life of the prisoners, but rather to restore the feeling of security of the SS men, which was badly shaken by the injustice which they not only

observed but perpetrated. The height in this farce of legality was reached when prisoners in concentration camps were forced to take out insurance against work accidents, or had to sign documents saying that they were well satisfied with the way they had been treated by the gestapo. The gestapo was very serious about such matters and put emphasis on such documents as demonstrations that everything happened in accordance with law and order.

It should be stressed in conclusion, that the camps' pur pose of providing training in inhumanity was less important than their purpose of influencing behaviour and even personality structure among the rest of the German population

The concentration camps were experimental labora tories for the gestapo, in which human beings served as guinea pigs. The nature of some of this experimentation has already been indicated. It should be particularly stressed that, according to the best authorities, the scientific values of these experiments were nil. It might be added that this had to be expected, because experimental efforts based on erroneous premises only rarely produce valid results.

Some of these experiments differed from other biological and medical research only in the fact that human beings took the place of experimental animals. This was true, for instance, of many experiments in grafting muscles and bones and of malaria, cancer and typhus research

Other experimentation concentrated on findings which might be useful during the war. Experiments along these lines were those in which prisoners were exposed to low pressure as it exists in the stratosphere, or were immersed in ice cold water in order to study the best methods for reviving or protecting fliers who had to descend in such waters. But most of the so called research efforts in the concentration camps concerned themselves with eugenics. Thus a great deal of "research" was done in the sterilization of members of the "lower" races, culminating in the extermination camps

* * *

A Few last words may seem in order about the world's reaction to the concentration camps. The terrors committed in them were experienced as uncanny by most civilized persons. It came as a shock to their pride that supposedly civilized nations could stoop so low as to com mit such inhumane acts. Three psychological mechanisms were most frequently used for dealing with the phe nomenon of the concentration camp. (a) Its applicability to man in general was denied by asserting (contrary to available evidence) that the acts of torture were committed by a small group of insane or perverted persons, thus having no applicability to man in general. (b) The veracity of the reports were denied and they were ascribed to deliberate propaganda. This method incidentally was most frequently used by the German government, which called all reports on terror in the camps horror propaganda (Greuelpropaganda). (c) The reports were believed, but the knowledge of the terror was repressed as soon as possible

All three mechanisms were observable after the defeat of Germany in 1945. After the "discovery" of the camps, a wave of extreme outrage swept the Allied nations. It was soon followed by a general repression of the discovery Possibly, this was an indication of how dangerous to one's self-respect was the acceptance of power of another's will,

even that of the state, to change one's personality, an admission that must be dealt with by action—or by repres

Congregational Christian Churches

The Congregational Churches dated their beginning in the U.S with the first settlement at Plymouth, Mass, in 1620 Subsequently the "Mayflower" Pilgrims merged with the later Puritans to form the Congregational Churches In 1931 these churches merged with the Christian Church founded before the Revolutionary War

The denomination from its earliest days preached and taught democratic ideals and sought to support and to extend these ideals in the common life. It fostered schools, colleges, social agencies and the democratic way in both church and state

At the end of the decade 1937-46 the denomination included 5,836 self governing churches linked together by voluntary ties of fellowship in common endcavour. In addition there were 678 missionary churches of this fellow ship in foreign lands. The membership of the churches in the USA was 1,130,824 with 121,200 members of the mission churches—a total of 1,252,024. The roll of ministers included 5,882 ordained persons, of whom 3,111 were pastors, 120 denominational officials, 101 missionaries 263 educators, 433 chaplains. The benevolent giving was \$3,951,495 and the home expenses of the churches \$19,301,121. Total property was \$171,892,927 and the in vested funds of the churches totalled \$31,225,155.

The American Board for Foreign Missions reported income of \$1,327,800 with investments of \$8,054,338 and the Board of Home Missions expenses of \$1,626,636 and investments of \$25,350,525. The annuity fund income was \$1,392,233 and investments were \$11,341,814. The total income of all the national agencies from all sources was \$6,232,247 and the investments were \$52,744,646.

The central office of the denomination was the General Council of Congregational Christian Churches, 287 Fourth Ave New York 10, NY. (F L F)

Congress, United States

The decade 1937-46 was spanned by the 75th-79th congresses of the United States Following is the member ship of the 75th congress, followed by that of the 80th congress, elected in Nov 1946. The list for the 75th congress is as of Jan. 1938, for the 80th congress, Jan 1947

75th Congress (1937-38)

Congress of Industrial Organizations

Coningham, Sir Arthur

He joined the New Zealand army in 1914, serving in Samoa and later in Egypt. Although invalided out of the dominion army in 1916, he recovered and joined the royal flying corps the same year. Shot down twice in action and once wounded, he was awarded the D.F.C. in 1919 and was given a permanent commission in the R.A.F. In 1925, Sir Arthur led a 5,600-mi. flight from Cairo across the North African desert and Chad territory to Kano in Nigeria and was awarded the Air Force cross for this achievement. Just before the start of World War II in 1939, Coningham was an air commodore in command of a bomber group. In 1941, he was assigned to the middle east armies with the rank of air vice-marshal. During the Allied offensive in Africa, Coningham (who later became an air marshal) commanded the northwest African tactical air force and gave air support to the British 8th army in its successful offensive against axis troops in Libya. He also participated in the Allied drive in Tunisia, serving under Gen. Eisenhower. On Jan. 25, 1944, he was selected as commander of the 2nd tactical air force of the R.A.F. for the invasion of western Europe. On Jan. 1, 1946, he was made a knight commander of the Order of the British Empire.

Connally, Thomas Terry

Connally (1877-), U.S. senator, was born Aug. 19, 1877, in McLennan county, Tex. He was graduated in 1896 from Baylor university and received his law degree from the University of Texas two years later. In 1917 he was elected to the U.S. house of representatives, but resigned to become a captain in an infantry brigade.

He later returned to congress, serving until 1928, when he was elected to the U.S. senate.

In contrast with his occasional opposition to President Roosevelt on domestic issues was his whole-hearted support of the administration's foreign policy. Before Pearl Harbor, he had stated that the U.S. should maintain a "policy of resistance" to the conquest of the democracies by the dictators. He voted for repeal of the arms embargo, the lend-lease act and the selective service law. He became chairman of the senate's foreign relations committee in the summer of 1941, and thereafter devoted most of his energies to supporting Roosevelt's war program.

Connally was one of the U.S. delegates to the U.N. conference in San Francisco in April-June, 1945. After congress had passed the U.N. participation bill (Dec. 19, 1945), Connally was named by President Truman as member of the U.S. delegation to the U.N. general assembly sessions in London which opened on Jan. 10, 1946.

He was again appointed, July 18, 1946, as a member of the U.S. delegation to the U.N. and on Aug. 2, he was appointed to the Joint Congressional Committee on Atomic Energy. Connally was re-elected to the senate in the election of Nov. 5, 1946.

Connecticut

One of the 13 original states, Connecticut is the most southwesterly of the New England states and popularly known as the "Nutmeg state," the "Land of Steady Habits," or the "Constitution state." In size, it ranks 46th among the states with an area of 5,009 sq.mi. (including

110 sq.mi. of water). The population (1940) was 1,709,242, of which 67.8% or 1,158,162 were urban. In 1940 there were 1,675,407 whites; 32,992 Negroes; 1,347,466 native born; 327,941 foreign born. Capital, Hartford (166,267). Other cities with 1940 population figures: New Haven (160,605); Bridgeport (147,121); Waterbury (99,314); New Britain (68,685); Stamford (47,938).

The principal state officers for the 1937-39 term were: governor, Wilbur L. Cross; lieutenant governor, T. Frank Hayes; secretary of state, C. John Satti. The most important legislation of 1937 was a series of acts reorganizing the central administration of the state. These acts included the establishment of committees on inter-governmental cooperation, a legislative council, and a governor's council, whose powers included certain functions in the interim between legislative sessions; of the department of finance and control; of the personnel department of the state's civil service; of the department of public works; and of the department of welfare and the public welfare council.

State officers elected in Nov. 1938 (to take office in Jan. 1939) were Raymond E. Baldwin, governor; James L. McConaughy, lieutenant governor; Mrs. Sara B. Crawford (the first woman elected to a state office), secretary of state. The new legislature, which was not in session in 1938, consisted of: Senate, 16 Republicans, 17 Democrats, 2 Socialists; House, 202 Republicans, 63 Democrats, 2 Socialists.

New legislation in 1939 included reform of the minor court system, together with a proposed constitutional amendment to alter the appointment of the judges for those courts; revision of statutes concerning foods, drugs, and cosmetics to harmonize with federal regulations; provision for alternate jurors in civil and criminal cases; requirement of uniform audit of town and municipal accounts; an anti-injunction law; and significant modification of social security, labour and liquor laws.

State officers elected in 1940 were the following: governor, Robert A. Hurley (Democrat, with 388,361 votes to 374,581 for Baldwin, Republican, and 18,090 for McLevy, Socialist); lieutenant governor, Odell Shephard; secretary of state, Mrs. Chase Going Woodhouse. The presidential vote in the state in 1940 was Roosevelt, 417,621; Willkie, 361,825. Francis T. Maloney, Democrat, was re-elected United States senator.

The 1941 legislature consisted of 22 Democrats, 13 Republicans in the senate; 88 Democrats, 184 Republicans in the house. A constitutional amendment was initiated to make legislative sessions annual instead of biennial. Another amendment called for an increase in the terms of elective officers to four years with elections in odd-numbered years. The common pleas courts was put on a state, instead of a local, basis and a state system of juvenile courts was created. A state council of defense was set up (Samuel H. Fisher, administrator) and the state was authorized to purchase land to be leased to the federal government for an army air base at Windsor Locks.

State officers elected in 1942 for the 1943-45 term were: governor, Raymond E. Baldwin (Republican, 281,362 votes, against Hurley, Democrat, 255,166, and McLevy, Socialist, 34.537); lieutenant governor, William Hadden; secretary of state, Mrs. Frances B. Redick.

The Republicans also won additional representation in both houses of the legislature, as follows: Senate, 22 Republicans, 14 Democrats; House, 201 Republicans, 71 Democrats.

(G. M. Du.; X.)

Connecticut tobacco workers erecting screens to protect a field of shade-grown tobacco. This commodity continued to be the leading agricultural product of the state between 1937 and 1946

Important measures taken by the 1943 legislative session were: the governor was empowered to suspend or modify laws conflicting with the war effort; the public works department was abolished and most of its duties transferred to the comptroller; a postwar planning commission was established; the commission on forests and wildlife allotted \$400,000 to purchase land; maximum payments for workmen's compensation were increased from \$25 to \$30 per week; and the state defense council was replaced by a war council with greater powers.

In the state election of 1944, state officers chosen for 1945 were: governor, Raymond E. Baldwin (Rep.); lieutenant governor, Wilbert Snow (Dem.); secretary of state, Charles J. Prestia (Dem.); treasurer, William T. Carroll (Dem.); comptroller, John M. Dowe (Dem.); attorney general, Francis A. Pallotti (Rep.). The Democrats gained control of the state senate by electing 21 seats out of 36: the house remained strongly Republican with 195 members to the Democrats' 77. Two special sessions were called during the year, the first, to amend the act regarding absentee voting and to extend the governor's wartime powers; the second, to again amend the voting law to conform to the Federal War Ballot act.

In the presidential elections a record number of votes

were cast. The result gave President Roosevelt 435,146 votes and Governor Dewey 390,527.

Legislation enacted in 1945 included: increase of the Soldiers', Sailors' and Marines' fund from \$2,500,000 to \$15,000,000, by increasing the cigarette tax from 2 to 3 cents per package; appropriation of \$750,000 for an armoury at Bridgeport; appropriation of \$2,000,000 for state school building grants to towns, with a limit of \$50,000 in any one grant; reduction from 52 to 48 hours in the maximum work week for women in certain industries; directing the Public Welfare council to make a study of juvenile delinquency; establishment of a board to administer a labour relations act, guaranteeing the rights of collective bargaining to workers engaged in intrastate industries. William C. Hadden (Rep.) replaced Francis A. Pallotti (Rep.) as state attorney general.

The election of Nov. 1946 resulted in a Republican landslide. A complete Republican state ticket, including U.S. senator, governor, lieutenant governor, secretary of the state, treasurer, comptroller and all six congressmen was elected. In addition, Republicans gained control of the general assembly by electing 28 senators to the Democrats' 8, and by electing 231 Republicans in the house to the Democrats' 41. (J. Br.)

Conservative Party, Great Britain

The history of the British Conservative party during the years 1937-46 was intertwined with historic events. The closing years of the 1930s were dominated by the shadow of the impending European tragedy. The great hopes placed in the League of Nations had failed to come true. Germany's determination both to redress the balance fashioned at Versailles and to dominate the continent were becoming evident. The year 1937, in which Stanley Baldwin retired from the premiership and was succeeded by Neville Chamberlain, also saw the beginning of the Sino-Japanese War in the far east.

With Germany, Italy and Japan outside the league, with the United States still following a policy of non-intervention and the U.S.S.R. preoccupied with an internal purge, little was left of collective security. There remained the hopes of dual security provided by France and Great Britain. This was the situation that faced Chamberlain on his accession to the premiership in the summer of 1937. In the face of the gathering storm a condition precedent to a successful British foreign policy was a large measure of unity between government and opposition. Unfortunately this was not achieved. The Labour party, while demanding a firm policy toward the axis powers,

The Conservative electoral campaign of 1945 was led by Winston Churchill, here shown addressing a rally at Rugby, England

made its support of the government's rearmament program contingent upon the adoption of a foreign policy based on collective security.

Chamberlain considered it his supreme duty to preserve world peace, and his whole policy was directed toward that end. Surveying the material devastation and moral deterioration caused by World War II, one would find it hard to argue that every possible attempt should not have been made to prevent war. Whatever judgment history might pass on Chamberlain's policy the country was convinced by Sept. 1939 that everything humanly possible had been done to reach agreement, and when the government was compelled to declare war it did so in the knowledge that it was backed by a united people. That moral unity was largely due to Chamberlain's untiring efforts.

The history of the party during the next five years was bound up with the war effort of the British people. At first unaided, then as partners in a great national (i.e., coalition) government, the Conservative majority in the house of commons was responsible for sustaining the morale both of government and people. Party propaganda was discontinued, the electoral truce was faithfully kept and the party organization drastically reduced. Speaking at a party meeting on March 10, 1942, Winston Churchill, who had succeeded Chamberlain as leader of the party in Dec. 1940, said: "They (the party) strove for peace too long, but when war came they proved themselves the main part of the rock on which the salvation of Britain was founded and the freedom of mankind regained." Prominent Conservatives were put in charge of many of the great departments of state: Anthony Eden was foreign secretary; Sir Kingsley Wood, chancellor of the exchequer until his death in 1942; Oliver Lyttelton, minister of production; Lord Woolton, who became chairman of the party in 1946, minister of food and later minister of reconstruction; R. S. Hudson, minister of agriculture; Oliver Stanley, secretary of state for the colonies; L. S. Amery, secretary of state for India; and Lord Cranborne, secretary of state for the dominions.

Other Conservatives were primarily responsible for the schemes of social reform which in its later stages the coalition government successfully brought to fruition. The Education act of 1944 was drafted and passed through

parliament under the direction of a Conservative minister of education, R. A. Butler. The Town and Country Planning act of 1945 was also the work of a Conservative, W. S. Morrison. Other White Papers for which Conservatives were primarily responsible were those on a national health service and on civil aviation, the ministers concerned being H. U. Willink and Lord Swinton. As members of the coalition, the leaders of the Conservative party pledged themselves to and took their full share in preparing the White Paper on full employment and the comprehensive scheme of social insurance which was later placed on the statute book.

In Feb. 1943 a Tory reform committee was founded in order to encourage the government in its own words, "to take constructive action on the lines of the Beveridge scheme of social insurance." Believing in the need for social reform, the committee advocated a policy, historically traceable to Disraeli's "Young England" movement, of Tory democracy. It emphasized the need for national unity, both in foreign and domestic affairs, and before the general election of 1945 published a substantial amount of literature on various aspects of domestic reconstruction. The movement met with both criticism and approval. Some regarded it as a necessary revival of Toryism's progressive instincts, while others criticized it for attempting to outplay the Labour party on its own ground.

With the approaching end of World War II the necessity for an appeal to the electorate became increasingly felt, although electorally speaking the party was still disarmed. Churchill, having failed to retain the services of the Labour and Liberal parties in the coalition government, resigned on May 23, 1945, and formed a transitional government almost exclusively Conservative in character. Parliament was dissolved in June. The pre-election polemics and the campaign itself aroused a political bitterness sadly out of harmony with the unity so successfully attained during the years of World War II. The Conservative party stressed the importance of retaining Churchill as prime minister both to help finish off the Japanese war and to lay the foundations of peace. In a manifesto to the electorate Churchill outlined a massive social reform program including full employment with the greatest possible encouragement of private enterprise, an all-out housing drive providing for the completion of 220,000 permanent houses during the first 2 years after World War

II, with another 80,000 on the way, proposals for dealing with land problems (compensation and betterment), agriculture, national insurance and health services. State supervision of monopolies, the progressive removal of controls, encouragement for the small business man and the technical reorganization of the coal mining industry were also promised.

Defeated at the polls, the Conservative party had both to build up an organization and to decide on a line of policy. It attacked the Labour government during the latter's first year of office for neglecting the essential needs of the people through its concentration on nationalization schemes. On the other hand, it supported and welcomed the government's production drive, while defending the merits of private enterprise. In the field of foreign policy the Conservative party supported Foreign Secretary Ernest Bevin although it deplored the handling of the negotiations with Egypt during 1946.

The concept of a "property-owning democracy" enunciated by Churchill in a speech at Edinburgh on April 29, 1946, revealed the goal towards which the party was moving. (See also Parliament, Houses of.)

Consumer Credit

The years 1937-46 were the most decisive in the history of U.S. consumer credit. A number of factors combined to test consumer credit and to qualify its force as an economic factor. Practically every economic phenomenon was compressed into that period. The world passed through a business recession, a transitional period in which nations armed for defense, a war period which brought extensive governmental regulations of credit policy and the beginning of the postwar boom.

The first year of this period, 1937, was normal in the sense that the effects of the 1929 economic depression had been largely overcome. A business survey covering more than 20,000 retail stores and conducted by the National Retail Credit Assn. (an organization composed of credit granters and devoted to the problems of credit research and sound credit policy) indicated that the first 9 mo. of 1937 were marked by a steadily rising volume of consumer credit outstanding, including both instalment and charge-account credit.¹

This stable, or expanding, period of credit continued until Nov. 1937. Beginning with that month and continuing through the entire year of 1938, each month's credit outstanding showed a decline from the comparable month in the previous year. The consensus of opinion was that this decline was primarily the result of unemployment in the manufacturing centres and a general industrial and

economic tension arising out of unsettled world conditions

In Jan. 1939 the downward trend in consumer credit volume was checked. That year showed a slow, but steady, rise in the volume of consumer credit. During 1940 this rise accelerated rapidly. The sudden rise in credit volume was attributed to the fact that the entire United States, in contrast to the rest of the world, was producing tremendous quantities of durable, expensive merchandise, the type ordinarily bought on the instalment plan. Full production and consequent full employment were the rule. These conditions gave rise to an unprecedented demand for consumer goods, a demand that could not be met out of current income.

At the close of 1941 the consumer credit outstanding in the U.S. reached an all-time high of \$9,889,000,000. When the United States entered World War II on Dec. 8, 1941, this large volume of credit outstanding was viewed with alarm by governmental leaders. It was felt that uncontrolled credit buying would be dangerous since there were several inflationary pressures already in operation. As the country's facilities were converted to war production, the quantity of durable goods available for purchase diminished. The cash income of all groups was at a high level. The extensive use of credit at this time would have contributed to the inflationary trend since credit makes it possible for the consumer to concentrate his demand at a given instant. Since most workers could look forward to rising wages and salaries, a large purchasing demand was created with the possible consequence that unlimited credit privileges would result in inflation. This pressure was curbed in Sept. 1941, by Regulation W.

Regulation W, in broad outline, proposed that all charge accounts should be paid within less than 60 days from the date of their origin and that instalment credits should have a maturity of not more than 12 mo. The act further provided that for all instalment purchases (and loans to make such purchases) a down payment of one-third of the total amount had to be obtained. With the introduction of Regulation W the volume of consumer credit outstanding began to drop rapidly. In 1942 it decreased more than \$3,000,000,000, leaving a total of only \$6,485,000,000 at the close of that year.

Governmental regulations could not, however, be considered as the major factor in the decline of consumer credit in the U.S. The figures cited simply followed the pattern noted throughout other countries engaged in World War II. By the early part of 1942 the U.S. industrial economy had been geared almost wholly to wartime production. Those items normally purchased on credit—that is, durable goods such as electrical appliances, expensive home furnishings and automobiles—were simply not available. Moreover, income of all groups was high in comparison with that of previous years. The large amount of readily available cash eliminated much of the need for credit since most of the goods available were of the non-durable and relatively inexpensive type.

It should be pointed out that the decline in credit outstanding was further affected through customers' liquidating a considerable number of their accounts that had been outstanding for some time. While credit sales declined, collection percentages rose. These two factors—(1) the liquidation of old accounts and (2) the opening of relatively few new accounts—combined to drive credit outstanding down to a total of \$5,000,000,000 in the latter part of 1943. This marked the low point in the decade.

In the early part of 1944 credit began to rise from this low. Higher prices and increased demand caused people

^{**}Instalment* credit refers to a purchase agreement, the terms of which are agreed upon by the purchaser and the seller. The contract is liquidated in accordance with this agreement. Charge account credit refers to the system whereby outstanding balances are paid in full at the end of a given period, normally the tenth of the month following the date of purchase.

to turn to credit again. For 19 mo., from July 1944 to the early part of 1946, consumer credit outstanding increased about \$550,000,000 per year. At the end of hostilities with Japan on Aug. 14, 1945, the upswing in credit gained momentum and after Jan. 1946 became phenomenal. Consumer credit outstanding rose more rapidly in the latter part of 1946 than in any other period during the 16 years for which official Federal Reserve board figures were available. The all-time high of \$10,000,000,000 was surpassed by Dec. 1946.

This rise and fall of consumer credit outstanding was not unattended by transformations in retail credit policies during the ten years. Its virtual disappearance from the economic scene as the usual way of doing business necessitated a reversal of established procedures. Cash buying became the rule.

The system of doing business on credit was well established throughout the world at the outbreak of World War II. Many firms did as much as 60% of their total volume of business through the means of instalment or charge-account sales. Three factors brought into the picture with the war reversed the trend toward credit buying: (1) The diversion of productive effort into the manufacture of war materials reduced the volume of available consumer goods. (2) Complex and restrictive systems of rationing of scarce items were introduced into almost all countries. (3) Full employment and great quantities of cash in circulation, particularly in the United States, routed credit for a time from its established position as a significant economic factor.

Inquiries for U.S. credit information decreased as a result of the lack of new charge-account business. The dislocation of the population because of service in the armed forces and migration to other sections of the country to seek new employment opportunities made much credit information valueless in the locality in which it rested. It was only through the system of interchange of information developed by the Associated Credit Bureaus of America and other organizations like it, that the machinery for checking the consumer's credit was kept intact.

With the end of the war with Japan, U. S. credit managers were faced with the problem of regaining lost chargeaccount business. There was a concerted rush on the part of retailers for this potential buying force. Retailers awoke to the fact that their old charge-account customers had converted to the practice of buying for cash, and no new accounts had been added. Aggressive sales promotion designed to recapture credit customers was begun. A typical example was the practice of department stores to restrict the sale of nylon hosiery (a scarce commodity much in demand) to those customers who had charge accounts with the organization. Other scarce merchandise was offered similarly as an inducement to get new credit business. An indication of the effectiveness of these promotions was the fact that the demand for credit reports from the various credit bureaus increased from 100% to 200% in 1946 as compared with 1941. In certain metropolitan areas, thousands of new credit customers were added during a single promotional activity. Retailing was attempting to replace all those accounts that had fallen by the way during the years of World War II. With the gradual reappearance of consumer goods, retailers realized that credit sales had to account for a considerable portion of future volume. Available figures indicated that this reasoning was sound. According to the Federal Reserve board figures for Sept. 1946, the accumulated savings in the United States amounted to \$130,000,000,000; but 50% of the families in the lower-income bracket owned roughly only 3% of those savings, or less than \$4,000,000,000. It was estimated that 20% of the families in the U.S. had no savings at all.

It was obvious, therefore, that great volumes of credit had to be extended if distribution were to continue high. The general credit picture at the latter part of 1946 found business organizing to continue the expansion of credit facilities along sound lines. By the end of 1946, the credit-reporting machinery of the nation was operating at capacity but was generally able to supply the needs of credit granters. The frenzied initial promotions designed to accumulate large numbers of credit customers at once were being discontinued. A stable trend pointing the way toward continuing credit expansion became evident, assisted by the limitations of the selling market itself. Many heavy consumer goods had not yet made their reappearance in the consumer market. Automobiles, normally responsible for the greatest dollar volume of any single production in the U.S., were still not available in sufficient quantities to satisfy the demand.

Banks and other financial institutions were taking cognizance of the expanding demand for credit by aggressively entering the field and seeking consumer credit business. Service organizations, such as transportation companies, were granting credit extensively. A tendency was noted on the part of labour and industrial organizations to finance credit dealings of members and employees. More than 400,000 new businesses were organized between 1944 and 1946, and many of these new firms were actively pushing credit sales. (See also Federal Reserve System.)

Great Britain.—Although in 1937 the possibility of war was casting its shadow over the trading community, instalment buying in Great Britain was still making progress and figures continued to rise steadily until 1939. The system had by that time been firmly established as an essential aid to production and distribution. Prejudices against it had been gradually broken down, and the participation of the Bank of England in United Dominions trust put on it the hallmark of complete respectability. No longer was it felt that there was something undesirable about consumer credit, and manufacturers of motorcars, radio sets, refrigerators, etc., took considerable pains to see that their selling organizations were adequately backed by instalment plans so that the products of the factories were available to every member of the community. It became accepted that by using credit people were not "mortgaging their future income," and the regularity of payments and the comparative infrequency of default indicated that people were taking careful stock of their commitments and were not rushing into obligations which they could not see their way to fulfill. The Hire Purchase act of 1938, giving the first statutory recognition of hire purchase, was an indication that the government was interested in the matter. Abuses were so few, however, that the value of the act need not be overrated.

In 1939 the complete cessation of the manufacture of consumption articles brought an end to consumer credit. Furthermore, the board of trade, in its zeal to arrest spending and encourage savings, restricted hire purchase in respect of some goods by controlling rates and methods of handling and prohibited it altogether in respect of other goods except those without profit to the seller. Companies whose business it had been to finance this type of credit had to turn to other forms of business. There was a considerable amount of contractors' plants for war

purposes coming on to the market and machine tools were in great demand; consequently, the resources of some companies were utilized in financing this. Some concerns found their way into actual trading, while one company in particular sought new fields of finance which would have a considerable effect on its postwar activities.

The maintenance of controls after the end of World War II, the shortage of labour and material and the insistence on manufacturing largely for export had not in 1946 provided much in the way of goods for the operation of consumer credit. Whatever goods were available were readily acquired for cash, but with increasing production credit would again be required if the total production of the factories was to be disposed of, and with the rise of the cost of goods consumer credit was likely to make an appeal to a large number of purchasers who previously had no reason to find use for it.

Contract Bridge

The years 1937–46 saw a notable advance in contract bridge in the all-important phase of standardization.

Whereas in 1937 a great many different "systems" were in vogue throughout the United States (and many others throughout the world), the end of 1946 found few differences in the style of bridge played in such widely separated communities as California and Maine, or Florida and Oregon.

Since contract was still comparatively young in the United States in 1937, it was inevitable that the best players should still be experimenting at that time, with a view to determining which bidding methods would give the best results. One of these experiments was codified into a system known as the Sims system, after its author Hal A. Sims, who had achieved prominence as the captain of a highly successful tournament team known in the early 1930s as the "Four Horsemen." The Sims system prescribed strong honour-trick requirements for opening bids in first and second hand positions, with the corollary that third and fourth hands had to open the bidding with far less than the traditional 21/2 honour-tricks. This latter technique was of course designed as "protection" for first and second hands who might have, in the interest of alleged strategy, passed game-going material. This system, known widely as the "protection system," was carried to extremes never dreamed of by its progenitor. Especially in New York city, the hub of contract bridge, many nationally known experts, particularly of the younger generations, went to the length of passing hands with as many as four honour-tricks in first or second positions and requiring their partners to open the bidding on as little as 1/2 honour-trick!

Needless to say, this fantastic system could not enjoy long life, since its results were scarcely comparable with those achieved by more orthodox methods. A concomitant of the protection system was the fad for "powerhouse" notrumps. A school of bidding held that the most effective one-notrump opening was on hands containing as many as six or even more honour-tricks, and naturally, when this grotesque approach was used, the partner was obligated

to respond even though he held a worthless hand. The basic philosophy behind this powerhouse notrump was the wishful thinking that any opponent unwary enough to overcall could be doubled and penalized crushingly; but, not unnaturally, as soon as the opponents became aware that a powerhouse notrump was being used against them, they substituted discretion for valour and stayed out of the bidding entirely, leaving the notrumper and his bewildered partner to their own devices.

The protection system and the powerhouse notrump disappeared from the bridge scene at about the same time—in 1937 and 1938. Another casualty was the psychic bid, which had been a phenomenon of the preceding five or six years. Psychic bids of various descriptions had struck the imagination of millions of players who, reared on the great American game of poker, with its indispensable phase of bluffing, fancied that these same bluff tactics could be applied successfully to bridge. Here, too, it was the gradual education of the rank and file of players which sounded the death knell of a fad. Standard methods of combating psychics were created and widely disseminated; after that the habitual psychic bidder found that his occasional successes could not begin to pay for his numerous losses.

Contrary to the fate of the protection system and the powerhouse notrump, however, psychic bidding did not disappear entirely; even at the end of 1946 master players still employed bluff bids; but where these were common ten years before, they were now extremely rare.

In the latter part of the 1930s, a new bridge galaxy known as the "Four Aces" (Howard Schenken, David Burnstine, Oswald Jacoby and Michael T. Gottlieb) rose to prominence through great success in tournament play and through the publication of a book describing their system. In substance this system differed little from the Culbertson system, which, throughout the years and during the decade, remained the overwhelming favourite of U.S. and foreign players. The most notable difference between the systems was the "point count" employed by the Four Aces to estimate notrump potentialities, as against the honour-trick count of the Culbertson system for all bids, notrump as well as suit openings, overcalls and raises. As both systems were refined throughout the years they came closer and closer together until, at the end of 1946, there was no material difference in any phase.

Some of the few changes in the Culbertson system were made in 1936 and 1937. One of these was the discontinuance of the so-called "S.O.S. redouble." Up to that time, if the bidding had proceeded:

South	West	North	East
1 spade Redouble	Double	Pass	Pass
Redouble			

South's intention, by redoubling, was to force a rescue from his partner—hence the descriptive title "S.O.S. redouble." It had been found, however, by long experience that the call for a rescue led to greater disaster than for South to stay at one-spade doubled, and for this and many other reasons the Culbertson system decreed that thereafter any redouble should be for "business," not for a rescue.

Another change in the Culbertson system was in the scope of one-over-one bidding. Theretofore, in such a sequence as:

	South	West	North	East
1	diamond	Pass	ı heart	Pass
1	snade			

the one-spade bid by South, being one-over-one vis-a-vis North's heart response, was an absolute force. It had been

found that this interpretation was neither flexible nor necessary, and therefore the forcing principle of one-overone bids was confined strictly to the first round, *i.e.*, if South opened with one heart (for example) and North responded with one spade, South was obliged to bid again; but now that the first round had been completed, further forcing had to be employed by means of jump bidding.

Requirements for original notrump bids in the Culbertson system were reduced from 4 to 5 honour-tricks to the more usable requirements of 31/2 to 4 honour-tricks.

In the field of slam bidding, the Blackwood convention gained enormous popular acceptance and was incorporated into the Culbertson system with acknowledgment to the inventor of the convention, Easley M. Blackwood of Indianapolis, Ind.

It was probably the simplicity of the Blackwood convention that so popularized it throughout the bridge-playing world. The convention, in its essential phase, is as follows:

When, during the auction, after a suit has been bid by either partner, if either partner then bids four notrump, he demands that the other name the number of aces that he may hold by responding according to this table:

To show no aces, responder bids fives clubs.
To show one ace, responder bids five diamonds.
To show two aces, responder bids five hearts.
To show three aces, responder bids five spades.
To show all four aces, responder bids five notrump.

After the four-notrump bidder has discovered the number of aces opposite him, he can then make the same investigation for kings, by bidding five notrump (except in the rare event, of course, that partner's previous response has been five notrump.) Responder then announces his kings according to the same table of suits in ascending rank.

Paradoxically, this slam convention, though not as efficient or explicit as the "asking bids" that had been a part of the Culbertson system, supplanted not only those slam devices but also, to a lesser extent, the numerous other conventions in this field of bidding.

In other phases of bridge there were few innovations. However, a school of master players in New York devised and experimented with the so-called "weak two-bid." Traditionally, an opening two-bid in a suit had always been reserved for extremely powerful hands, containing game-going characteristics regardless of partner's support. In the weak two-bid, honour-trick requirements were slashed and the forcing-to-game nature of the bid was dropped. The adherents of this short-lived system held that it was worthwhile to abandon the advantages of the traditional two-bid for the advantage of forcing the opponents to enter the auction, if they did enter, at the higher levels, thus laying themselves open to penalty doubles. In this weak two-bid system only the bid of two clubs was reserved for enormous hands, not necessarily containing a club suit. This being an artificial bid, a series of artificial responses was required; and it was soon found, as in the case of all artificial systems, that the results did not justify the means. Thus, after approximately 20 years of contract bridge, it had been found that the forcing two-bid, the original cornerstone of the Culbertson system, was still the best device for the successful handling of superstrong holdings.

It was also found, after these 20 years, that no other card game had so much as threatened the supremacy of contract bridge. Even throughout World War II, contract bridge flourished and gained tens of thousands of new adherents. Entries in tournaments conducted throughout

the country increased steadily, until in 1946 all previous records were toppled. The game's popularity in general was undoubtedly due to the aforementioned standardization

Co-operative Movement

The world-wide co-operative movement underwent many changes during the years 1937-46. In Germany and in the countries overrun by the nazis the movement was not destroyed but was brought under nazi control. In general the peasant co-operatives were preserved and used as agents for the production and marketing of food, whereas the consumers' stores were discouraged and in some cases closed, and many of the factories and wholesale agencies owned by them were wholly or partly liquidated and handed over to private firms.

After the liberation these European movements were rapidly rebuilt, but the process of getting them back into full working order was bound to take a considerable time.

In Great Britain, the consumers' co-operative movement made steady, though not sensational, advances. It had in 1946 between 9,000,000 and 10,000,000 members, or approaching a quarter of the total population of all ages, and it played a large part in the working of food distribution under rationing. It also built up considerable reserves of capital, and the local societies showed a tendency after World War II to launch out on new ventures, including the purchase or establishment of large, central department stores, pharmacies, hotels and restaurants, theatres and motion picture houses. Its most rapid growth was in the retail trade in milk and coal.

The wholesale societies also widened their range and were interesting themselves increasingly in travel agency, house-building and the extension of manufacturing activities. The much smaller producers' co-operative societies pursued an uneventful, but on the whole successful, course; and there was some expansion of agricultural co-operation. The agricultural societies were engaged in 1946 in forming a new federation of their own, independent of the National Farmers' union, which previously had dealt with general issues affecting them.

The British co-operative party had a big success at the general election of 1945, raising its representation in parliament from 9 to 23. It negotiated after the election a new agreement for closer working with the Labour party, to which its parliamentary representatives belonged.

In America there were considerable developments of both consumers' and agricultural co-operation, though the movement throughout the American continents was still in its infancy, except for the well-established co-

operatives among the grain growers in Canada which were marketing more than one-quarter of the total crop. In Canada there was a spread of co-operative credit societies in the eastern provinces.

In the United States the decade was a period of widely diversified experiment. In 1937 there were well-grounded farmers' co-operatives, principally for marketing; but consumers' co-operation was almost unknown until the years of depression. By 1946 there had come into being not only a considerable number of consumers' stores, but also co-operative restaurants, gasoline stations, insurance companies, theatres, medical societies and many other experiments. (See below.)

În Latin America co-operation was strongest in Mexico and in Argentina. In Mexico the movement received strong encouragement from the government. In 1941, there were 761 consumers' societies, with 57,000 members, and 1,006 producers' societies, mainly in farming, with 33,000 members. These included a number of collective farms. In Argentina the consumers' society was the most strongly developed type; but there were also numerous agricultural societies, including especially dairies and produce-marketing societies, the total membership in 1946 being about 500,000. Peru, Bolivia, Chile, Colombia, Uruguay and Brazil had also substantial co-operative movements; and these had been growing fairly fast. They were largely but not exclusively agricultural.

In Asia the most remarkable development was that of the Chinese industrial co-operatives, which played a very, important part in getting industries restarted in the areas beyond the limits of the Japanese conquest. The Chinese made great efforts in their retreat to take with them what industrial equipment they could; and much of this plant was restarted in co-operative factories and workshops, while other new enterprises, mostly on a small scale, were set up under co-operative control. In India the peasant organization attached to the National Congress had been active in extending co-operative activity; but development was patchy. The movement was strongest in the Punjab, where it received steady government encouragement, especially for rural credit societies. Co-operation was strong in Ceylon, where there were consumers' societies on the big tea estates as well as credit and thrift agencies.

In Africa, co-operation remained weak, but efforts had been made to establish societies in Nigeria and the Gold Coast, and the colonial governments had given special encouragement to these ventures. The Union of South Africa had numerous agricultural marketing societies, and there was a spread of consumers' societies in the larger towns

In Australia and New Zealand, agricultural marketing societies were the predominant type. Almost all the production of butter and cheese in New Zealand was under co-operative control. In Australia the movement was strong in grain marketing, and consumers' co-operation had been spreading in the more populous parts of the country.

In Europe, the Scandinavian countries were in 1946 still the most strongly organized of all, in relation to population; and after the liberation of Denmark and Norway the activities of the joint trading organizations maintained by the co-operatives of the Scandinavian peoples were rebuilt and extended. In Poland agricultural co-operation had been powerful for a long time; and there, too, active reconstruction was in progress after the liberation. Czechoslovakia had a strong consumers'

movement, as well as many agricultural societies; and agricultural co-operation was developing fast in Yugoslavia. The U.S.S.R. still had the largest total co-operative membership of any country, even excluding the collective farms, which were in effect a form of agricultural co-operation. Consumers' co-operation in the U.S.S.R. had been confined since 1935 to the rural areas, the town stores having been taken over by the state trading organization.

The world body representing the co-operative movement was still the International Co-operative alliance, to which most of the national movements belonged. The I.C.A. was practically in abeyance during World War II, and had been cut off for some time previously from the national movements in Germany, Austria and Italy. It held its first postwar congress in 1946 and took an active part in helping the movements in the liberated countries back on their feet. Exact membership statistics in 1946 were still unobtainable for many countries.

An enquiry made by the International Labour organization reached the conclusion that on the eve of the war there were in the world about 800,000 co-operative societies of various types, with an aggregate membership of about 143,000,000. Of these, about 50,000 were consumers' societies, with nearly 60,000,000 members. More than 672,000 were agricultural societies, with 64,000,000 members; the rest were mainly industrial producers' societies, housing societies and co-operative credit agencies in the towns. Of the total members, upward of 60,000,000 were in the U.S.S.R. and about 53,000,000 in the rest of Europe. America and the rest of Asia each had between 14,000,000 and 15,000,000 co-operative members, and Oceania about 500,000. The totals were in all probability substantially larger, especially in the U.S.

The problems which were most under discussion among co-operators in 1946 included the methods to be adopted in order to promote "inter-trading" between the national movements and especially between those of the agricultural and industrial countries. Plans were on foot for developing a new international trading agency, perhaps based on the agency founded by the Scandinavian movements. There was also much discussion on the question of political attitudes, some co-operators favouring strict political neutrality, whereas others, such as the British, took part in politics, in close alliance with the Labour or Socialist parties of their nations.

On the whole, the trend in continental Europe was rather toward political neutrality; but this was less a matter of principle than a result of the sharp division between communists and social democrats in many European countries. Political affiliation with Labour or Socialist parties, where it existed, was mainly of the consumers' movements. The agricultural co-operatives nearly everywhere professed political neutrality, though some of them had fairly close links with peasant parties, especially in eastern Europe. (G. D. H. C.)

U.S. Consumer Co-operatives.—Consumer co-operatives in the United States made the greatest progress in their history during the decade 1937-46. This was true of all branches of the movement, but some branches of it made more progress than others.

The commodity co-operatives handling all kinds of commodities—foodstuffs, household goods, petroleum products and farm supplies—recorded a threefold growth in business and a great increase in membership. Volume of goods handled jumped from an estimated \$365,000,000 in 1936 to more than \$1,000,000,000 in 1946. Service co-operatives, also consumer-owned, made even more spec-

tacular progress. In this field were credit co-operatives or credit unions, housing co-operatives, co-operative health associations and hospitals, co-operative banks, insurance companies, utility or electric power co-operatives, student "co-ops," burial associations and other service organizations.

At the close of the decade, membership in the commodity co-operatives stood at more than 2,500,000 families. Service co-operatives had more than 5,000,000 memberowners. There was, however, considerable duplication of membership and as a result there were no dependable estimates of the net number of members of consumer co-operatives. Since each member was usually the head of a family, any net membership figure should be multiplied by four. The result would indicate that a good section of the U.S. people was associated with co-operatives.

Consumer co-operatives handled one-fifth of all the farm supplies purchased in the United States. The petroleum co-ops did 22% of the gas and oil business in the rural sections of the United States—a business of more than \$250,000,000 in 1945. More than 1,600 food stores served consumer-owners in about 35 states.

As business volume warranted, the co-ops moved into the field of production. By the end of the decade, co-operatives affiliated with National Co-operatives, Inc., owned and operated 158 mills, factories, refineries and other productive enterprises in the U.S. and Canada. At least 100 of these had been acquired after 1939.

Most spectacular development in consumer-owned cooperative production was in petroleum products. The first co-op refinery in the U.S. was built in 1939 and began operation Jan. 1, 1940. By the end of 1946, the co-ops owned and operated 10 oil refineries, 1,600 mi. of pipe line and 700 oil wells.

Other production enterprises included feed and seed mills and fertilizer factories, farm implement factories, chick hatcheries, paint factories and printing plants, lumber mills, coal mines; and in the food field, canneries, bakeries, creameries, bottling works, flour mills and coffeeroasting plants.

The largest central organization in the commodity field was National Co-operatives, Inc., with headquarters in Chicago, organized in 1933. In 1936 the wholesale business of its member associations was about \$30,000,000. At the close of 1946, it was owned by 22 regional co-operative associations with nearly 5,000 retail units in the U.S. and Canada. Wholesale business of these member associations was \$178,000,000 in 1945 and was estimated at more than \$200,000,000 in 1946. In addition to purchasing for its member associations, National Co-operatives owned a milking-machine factory, hot-water-heater factory, chemical-products plant and flour mill.

Largest organization in the co-operative service field was the Credit Union National Assn. with 3,500,000 members of 10,000 credit unions. Organized in 1934, C.U.N.A. moved its headquarters to Madison, Wis., early in the decade to be near the centre of the movement.

The rural electric co-operatives were nearly all organized during the decade. Pushed forward greatly by the creation of the Rural Electrification Admin. in 1935, the power co-ops by 1946 were bringing electric light and power to 1,250,000 U.S. farms. An embryo Co-operative Finance Assn. of America was organized in 1945. Co-operative insurance companies had no national organization but had nearly 1,000,000 policyholders.

During 1946 three new national organizations were formed—the Co-operative Health Federation of America; the National Co-operative-Mutual Housing associations and the North American Student Co-operative League. Six co-operative hospitals and a score of co-operative health associations were in operation. About 100 co-op housing projects were scattered throughout the country, and many more had plans drawn for construction as soon as building materials were available. Eight mutual ownership projects built by the government were being purchased by their tenants.

What might look to the outsider as a very complicated organization structure was beginning to take shape. Late in 1946, after 2 years of discussion, the 30-year old Cooperative League of the U.S.A. passed over to National Cooperatives its educational work for commodity co-operatives and "moved upstairs" to become a national federation of both commodity and service co-operatives. Closer co-ordination and integration, bringing added strength to the U.S. co-operatives, was a major project of the years ahead. (W. J. Cl.)

Copenhagen

The Danish capital (pop. est. 1940, 700,465) had its greatest shock of modern times on April 9, 1940, when the German army quite unexpectedly occupied the city at 4 A.M. The first two years passed without great difficulties. Neither the German army nor its political representatives interfered with municipal government. In the autumn of 1942, however, the Danish resistance movement began its sabotage operations. It was not long before the population showed its sympathy with the resistance movement openly. Bombardment by British aircraft of the shipyard of Burmeister and Wain in June 1943 helped the population to realize that Danish sabotage was preferable to British bombs. On Aug. 29, 1943, a military state of emergency was declared by the Germans, and the government and rigsdag ceased to function. The local government of the city continued to manage its own affairs after a short occupation by German forces of the town

From that date and onward, events moved quickly. The will to resistance grew. On Sept. 8, 1943, a German soldier was killed in the streets of Copenhagen. The German commander exacted a penalty of Kr.1,000,000 (\$193,080) from the city in punishment. During the following month the city had to pay a further Kr.7,500,000 (\$1,448,100) for German soldiers killed. As these penalties did not have the desired result, the Germans instituted other measures such as clearing murders.

The greatest event in Copenhagen during the occupation was the people's strike. In June 1944 the Germans instituted a curfew in order to prevent saboteurs from working in the hours of darkness. The population retaliated by moving their tables and chairs out on the pavement, where they sat playing cards until the gestapo's cars drove, shooting, through the streets. The gestapo

Montana . . Nevada . . New Mexico Utah . . . Vermont . . Washington .

28

now murdered many Danish patriots, and it needed only this fresh evidence of barbarism to produce a spontaneous civic strike. All work ceased, the shops closed, the trams and trains remained stationary and in a few hours Copenhagen was like a dead city. Helpless in their fury the Germans now stopped all water, gas and electricity. At the same time no one was permitted to leave town and no one to come in. After four days the work was resumed. The Germans had to abolish the cursew and to disperse the hated Schalburg corps. During this people's strike the good work done by the Danish Liberation council was for the first time brought home to the Danes.

On Sept. 19, 1944, the Germans had the whole of the Copenhagen police arrested, and the citizens themselves had to form civic guards. From then on there was no stopping the sabotage. As a countermove the Germans took to blowing up various buildings and pleasure parks such as the Tivoli. The last months after the arrest of the police were the worst experienced. Terror and murder became the order of the day. Every night bombs burst and no one felt secure until May 4, 1945, when the British Broadcasting company informed Danish listeners that the Germans had capitulated and Denmark was again free.

Copper

World copper output declined by an eighth under the adverse conditions of 1938 and had not yet recovered to the 1937 level of operations when World War II broke out in Europe in Sept. 1939. Under the pressure of war demand, production increased to a peak of 3,090,000 short tons in 1943, or 20% more than the 1937 level and 22% more than the 1939 level.

From this point, supply having caught up with demand, there was some decline in output, with 1944 dropping 7% less than in 1943.

When the war came to an end in Europe early in May 1945, the demand for copper was reduced, and with the Japanese surrender in mid-August it largely disap peared. Although there was a large potential demand for the civilian uses that had been deprived of copper during the war years, it was not possible to maintain output at war levels without war incentives, and in 1945 output declined 15% from 1944, and 22% less than the peak of 1943, bringing it to a point practically on a par with 1939 In view of the large potential civilian demand, industry should have been able to absorb copper at this rate for some time to come, but when the reconversion program was delayed by differences of opinion on procedure, by labour disputes and strikes, by uncertainty as to prices, and other minor factors, the production rate for copper was greatly decreased, and the output for 1946 showed another sharp decline.

In supplying the increased war demand for copper,

the brunt of the load fell on the United States, Chile and Canada. Increases in output by other countries were less than the change in world output. Chile produced 17.7% of the world total in 1937, and 18.1% in 1943, while the United States' share rose from 32.7% to 35.3%. Corresponding percentages for all other important producers were less in 1943 than in 1937; Canada's

percentage increased in

1940, but later declined. United States.-Being at the same time the world's largest producer of copper and the largest producer of munitions, it was only natural that war demand for copper was heavily concentrated in the United States. While the already large domestic output was increased by 30% between 1937 and 1943, as compared with a 20% increase in world output, and an appreciable increase was

Open cut copper mine at Bingham canyon, Utah. The Bingham district ranked first among copper producing districts of the world in 1944 and first in the U.S. during the entire decade 1937—46

Removing ore from an open-cut copper mine in Chile

made in secondary recovery, it was only by expanding imports, restricting exports and eliminating nonessential uses that the supply could be made adequate for war demands.

War production strained the producing capacity of the United States almost to the limit, and it would have been impossible to reach the peak of 1,090,818 tons in 1943 without material assistance from the premium price plan, which enabled marginal producers to maintain production. The result of the plan's operations from its beginning in Feb. 1942 to the end of 1945 is outlined in Table IV

Table IV.—Production of Copper under Premium Price Plan (Short tons)

										Ceiling Price	Premium Price	Total
1942										88Ĩ, 7 11	106,383	988,094
1943										841,286	249,532	1,090,818
1944										722,791	246,998	969,789
1945	•	•	٠	٠		٠		•		561,851	212,381	774,232
										3,007,639	815,294	3,822,933

According to these figures, bonus payments to producers whose operating costs were above ceiling price made possible the production of 815,294 tons of copper in these four years, most of which could not have been produced without these payments. In other words, the premium price plan prevented a shrinkage in production that would have cut output during the crucial war years by about one-fifth.

The gradual tapering off of the annual increases in output, with only 10,000 tons increase in 1943, indicated that the U.S. copper mines were approaching their limit

of output, and it is doubtful if another similar addition could have been made in 1944, even if the peak of demand had not been passed. A decline of 11% in U.S. output in 1944 as compared with a drop of only 7% in the world total, and a decrease of 20% in 1945 against a world drop of 15%, were further indications of the overstrained conditions that prevailed.

Mine production declined steadily in 1945, dropping from 70,114 tons in January to 58,174 tons in December. In 1946, this declining rate was aggravated by strikes in the industry, bringing monthly output to a low of 31,962 tons in April, increasing in the succeeding months as the strikes were settled and conditions improved. By October, output had increased to 64,928 tons, and the total for the 10 months was 474,307 tons, indicating a total for the year of little if any more than 600,000 tons.

After the abandonment of price controls in Nov. 1946, the price of copper was increased. The domestic price of 11.775 cents, which had been maintained through much of the war period, was raised to 14.15 cents on June 3. The export price of 11.7 cents had been gradually rising from June and reached 17.43 when the first postcontrol domestic increase was made on Nov. 12, to 17.275 cents. At mid-December, the domestic price was 19.275 cents and export 19.425 cents.

Canada.—Contrary to the experience of most countries, Canada suffered no decline in copper output in 1938 and forged ahead to its peak output of the war, years in 1940, with an increase of 24% more than in 1937. Output decreased steadily in the succeeding years, with 238,142 tons in 1945, down 10% less than the 1937 level. The decline continued into 1946, with 137,816 tons in the first three quarters, 27% less than the same period of 1945. Much of the decline from the 1940 peak could be attributed to shortage of labour, and the end of the war accentuated the drop in 1945, which would have been even more pronounced but for increased exports to the United States. The shortage of supply in the United States led to the importation of 89,965 tons of Canadian copper in 1945, against 61,292 tons in 1944. Another deterrent factor was the fact that close to half of the Canadian output came from nickel mines, with demand for nickel supplementing that for copper.

Chile.—Copper production in Chile increased by 23% between 1937 and 1943, with the bulk of the output going to the United States. After reaching a peak output of 9,561,383 short tons in 1943, declines were relatively small—2% in 1944 and 5% in 1945; reduction in activity became more pronounced in 1946, with the output for the first five months of the year at 137,816 short tons, 17% less than the average rate for 1945.

Mexico and Peru.—Although there were some fluctuations in output in these countries, they were little affected by war conditions. Production increased mildly in Mexico and declined about the same amount in Peru.

Belgian Congo.—After Chile and Canada, the Belgian Congo remained the leading source of U.S. imports. Close to half of the output was sent to the United States. Production was not greatly increased under war demand but was maintained quite consistently. The peak year, 1942, was 11% more than in 1937, and subsequent declines amounted only to 4%.

Northern Rhodesia.—As in Canada, copper production in Northern Rhodesia reached its peak in 1940, with an increase of 7% more than in 1937. Subsequent declines were even more pronounced than in Canada, with that of 1945 down to 27% less than the peak and 22% less than in 1937. Practically all of the Rhodesian copper went to

Great Britain during the war years, but in 1945 about 90,000 tons were diverted to the United States. (See also MINERAL AND METAL PRODUCTION AND PRICES; STRATEGIC (G. A. Ro.)

Copyright

Literary and artistic property is protected in the United States by the Copyright act. This act was designed to cover many different varieties of writings, books, dramas, music, photographs, motion pictures and works of art. It gave the author or copyright proprietor certain exclusive rights (including the performing rights in the case of dramatic and musical works) for a period of 28 years, subject to renewal for a like period. Copyright is secured by publishing the work with the prescribed notice or, in the case of certain classes of works, by depositing a copy with application and fee in the copyright office. The copyright is lost if the work is published without the requisite copyright notice, which for a literary, dramatic, or musical work consists of the word "Copyright," or the abbreviation "Copr.," accompanied by the name of the owner of the copyright and the year of publication. Promptly after publication, two copies of works published in the U.S., or one copy of those published abroad, must be sent to the U.S. copyright office, together with the requisite fee and application.

During the decade 1937-46 the Copyright act was amended in several respects: in 1938, to permit the postmaster general to print and copyright black and white illustrations of U.S. and foreign postage stamps for philatelic purposes; in 1939, to transfer jurisdiction over the registration of prints and labels from the commissioner of patents to the register of copyrights; in 1940, to permit authors to renew the copyright in their contributions to periodicals or other composite works even though not originally copyrighted separately by the author, and to enable the secretary of the treasury and the postmaster general more efficiently and effectively to administer the provisions of the act relating to importation of copies of works; in 1941, to authorize the president to issue proclamations extending the time for foreign authors and publishers to comply with the requirements of U.S. law, because of the disruption and suspension of facilities as the result of World War II. The only such proclamation issued was the one of March 10, 1944, with respect to British nationals, in exchange for a corresponding British order in council in favour of U.S. nationals.

U.S. Court Decisions.-A number of important court decisions arising under the Copyright act were handed down during the decade. Among them was The Washingtonian Publishing Co., Inc. v. Pearson, (1939) 306 U.S. 30, in which the supreme court held that tardiness in the deposit of copies following publication neither destroyed the copyright nor prevented suit for an infringement occurring before their deposit.

Another important case was Fred Fisher Music Co., Inc., v. M. Witmark & Sons, (1943) 318 U.S. 643, in which the supreme court considered the question of the protection given the author by the division of the copyright period into two terms of 28 years each and the provision that copyright for the second term could not be obtained until the last year of the first. The court held that before the time for renewal arrived the author could bind himself by contract to assign his interest in the renewal of the copyright after he secured it.

In Shilkret v. Musicraft Records, Inc., (1943) 131 F. 2d 929, the circuit court of appeals (2d Cir.), overruling the lower court, held that the provision of the Copyright act securing to the copyright proprietor the control of mechanical reproduction of music "published and copyrighted after July 1, 1909," applied equally to copyrighted unpublished musical works, since it was not the purpose of congress to discriminate between published and unpublished music, but merely to confine the right of mechanical reproduction to compositions copyrighted after the effective date of the act. Certiorari was denied by the supreme

In Taylor Instrument Companies v. Fawley-Brost Company (1943), 139 Fed. 98, the circuit court of appeals (7th Cir.) held that recording charts were not copyrightable; that such charts were objects of use and not of explanation or instruction, being essentially mechanical elements of the instruments on which they are used. The supreme court declined to issue a writ of certiorari to review the case. The same ruling was made in the case of Brown Instrument Company v. Warner (1945) 68 United States Patents Quarterly 41, an action brought in the district court, D.C., for a declaratory judgment to compel the register of copyrights to accept and register similar recording charts.

International Copyright.-In the field of international copyright the outstanding event was the conference of delegates from the several republics of North and South America, in Washington in June 1946, at the Pan American union, to draft a convention giving intellectual works uniform protection throughout the hemisphere. The result was a new convention which, if ratified by the several governments, would replace the Buenos Aires Copyright convention of 1910.

Because of World War II, there were no important developments in Europe, except for plans to hold the deferred conference at Brussels to revise the Berne Copyright convention.

U.S. Statistics.—The number of copyright registrations made each year increased approximately 31% during the decade, that is, from 154,424 to 202,144. This great increase was due primarily to a marked growth in the number of musical compositions and periodicals, the two classes of materials which together accounted for more than half the total number of registrations. Musical compositions increased 100% to 63,367, a figure eight times as large as the number of books.

This expansion presumably was an outgrowth of the development of the radio, which greatly increased the profitableness of composing music.

The increase of 27% in the number of periodicals registered each year was apparently due to a growing realization on the part of publishers of the advantages of copyright, for there was no increase during the decade in the number of periodicals published in the U.S. Of the numerically less important classes of materials, prints and pictorial illustrations increased 39%, maps 9%, motion pictures other than photoplays 30% and renewals 45%.

The most important decrease was in the number of registrations of books published in the U.S., which dropped approximately 31%, from 11,244 to 7,679. This represented, of course, a genuine decline in the number of publications and was due to World War II. The number of books printed outside the U.S. in a foreign language and sent to the copyright office for copyright registration was also greatly affected by the war. It dropped from 3,841 in 1937 to 82 in 1944 and then recovered to 3,513 in 1946.

Only a small percentage of the stories and other articles appearing in periodicals were copyrighted separately from the periodicals in which they appeared. The number so copyrighted dropped 27% to 5.504 in the decade. This decline may well have been due to the fact that a larger percentage of the magazines in which these articles appeared were now being copyrighted. (See also Book Publishing Law; Radio.) (S. B. Wr.)

Corn (Maize)

The United States corn crop again became a 3,000,000,000 bu. crop during World War II, a record first attained in 1906 and again in 1920. For the five years 1942–46 the average exceeded 3,000,000,000 bu. This was even more remarkable because the acreage was not much above the 1934–43 average, and considerably below that of the record year 1917 during World War I.

The acreage of corn expanded steadily from the American Civil War until 1900 then remained fairly stable until 1909, when it reached 100,000,000 ac. Most crops covered this area until 1931-33, when low prices led farmers to increase acreage of corn, their highest yielding crop. The drought of 1934 and the government's allotment program reduced acreage, which continued to drop to 87,631,000 ac. in 1941, the lowest after 1894. An increase followed, to 97,078,000 ac. in 1944, about the same as had been grown in 1937. While the acreage was not increasing, the new record yields were responsible for the increase in the total crop. Average yields for the U.S. ranged from 20 to 30 bu. until 1934, when the yield dropped to 15.8 bu. per ac. and again in 1936, when it was 16.2 bu. The result was that these two years had the smallest crops in more than 50 years. By 1937, the yield was back to 28.3 bu. per ac. and the crop was above the average of 1935-39. The great increase came in 1941, when the yield increased to 31 bu. per ac. and then by successive steps 35.2 bu. in 1942, 32.1 bu. in 1943, 33.2 bu. in 1944, 33.1 in 1945 and 37.1 in 1946.

Total corn production fluctuated widely with the yields from year to year. The prewar average was about 2,300,-000,000 bu. in 1935-39 which period included the small crop of only 1,505,000,000 bu. in 1936. The second half of the decade, 1942-46, returned three successive crops of more than 3,000,000,000 bu. each, the largest in 1944. This fortunate development, during the period of great war need, was the result of a succession of favourable seasons and outstanding scientific progress in agriculture, such as the introduction of hybrid seed corn. This seed, estimated to have increased yields 20% over the old seed, was used in 58% of the total U.S. acreage planted in 1944, 64% in 1945 and more than 85% in the leading corn belt state, Iowa. Not only was the yield larger, but the crop was more vigorous and rapid-maturing; losses from early frosts were thus reduced. It was estimated that nearly 500,000,-000 bu. of the increased corn crop could be attributed to the use of hybrid seed in 1945. The range of corn yields between states in 1945, a typical year, was from an average of 10 bu. per acre in Florida to 49.5 bu. in Ohio. In the corn belt the five big corn states reported yields per acre as follows in 1945: Indiana, 53 bu.; Ohio, 49.5 bu.; Iowa and Illinois, 46.5 bu. each and Missouri, 27 bu. In 1946 Iowa harvested the record average of 60 bu. per ac. and Illinois 57 bu. The crop was also good along the Atlantic coast, and New Jersey reported an average yield of 45 bu. per ac., Pennsylvania, 44 bu. and Massachusetts and Connecticut each 43 bu. Only occasionally had several years of high yield come together, notably in 1919–23 and for a long period 1937–46. The effects of the increased use of fertilizers were difficult to measure but were estimated to have added one bushel to the yield in 1943.

About 60% of the acreage of corn and 75% of the production continued to be in 11 states: five corn belt, three lake (Michigan, Wisconsin and Minnesota) and South Dakota, Nebraska and Kansas. The shift of corn production to the west was shown by the estimates that the production of the northern plains and the lake states was increasing. Of the individual states, those with the most rapid increase in corn production were Iowa, Minnesota and Nebraska. In Illinois, Indiana, Ohio and Michigan the general trend in acreage was downward with the growth of the soybean acreage.

In 1938 the Agricultural Adjustment administration reduced the acreage of corn by quotas and subsidies in the commercial area which comprised 566 counties in 12 states. A similar program was adopted in 1939. The stocks of corn were so generally used by 1944 that the War Food administration asked for a 100,000,000 acreage, but only 97,579,000 ac. were harvested. The high yield brought the record output.

The small crop of corn in 1936 caused the farm price to reach the high average of \$1.04 per bu., exceeded only in 1916–19 and in 1924. In 1937–39 the price was 51.8 cents to 56.8 cents per bu. Prices then advanced to a top of \$1.12 per bu. in 1943. The average price of corn in the period 1935–39 was 69 cents per bu. at the farm. Loans on stored corn were held at 90% of parity through 1946, and in Jan. 1946 the actual price stood at 96% of parity or \$1.14 per bu. In July corn averaged \$1.96 per bu. at the farm then declined to \$1.22 in December.

Most of the corn crop continued to be fed to livestock on the farms where it was raised. In 1937, only 566,000,000 bu. of the crop of 2,642,900,000 bu. was sold for commercial purposes or to other farmers for feed. These sales rose to more than 760,000,000 bu. in 1944. The stocks of corn owned by the government amounted to 105,000,000 bu. in 1940 and 132,000,000 bu. in 1942, the two years when there was a large reserve. Oct. 1 stocks in terminal markets in the same two years rose to 41,179,000 bu. and 39,137,000 bu. respectively. Farm stocks were only 60,004,000 bu. in 1937 but rose to 553,793,000 bu. in 1939 and then averaged more than 300,000,000 bu. through 1945.

The commercial uses of corn changed somewhat during the decade. The amount of corn made into breakfast foods increased from 6,981,000 bu. in 1937 to 12,000,000 in 1944. Other dry-process uses (meal, hominy and grits) increased from 39,357,000 to 62,000,000 bu. The wet-processes (starch, syrup and sugar) increased most of all, from a utilization of 71,647,000 bu. in 1937 to 125,000,000 bu. in 1944. Alcohol and distilled spirits increased consumption from 18,376,000 bu. to 38,000,000 bu. In 1945 the big demand for corn for feed and food led the government to restrict the use of corn for alcohol making.

U.S. foreign trade in corn was not important before the drought period of 1934. Exports had reached a total of 200,000,000 bu. once in 1897. In 1921 the top was 167,800,000 bu., followed by a decline to a few million bushels each year until 1934. As a result of the drought, corn imports which had averaged less than 1,000,000 bu., rose to

*Preliminary e	estimate.							

36,955,000 bu. in 1934; 21,096,000 bu. in 1935 and to 103,670,000 bu. in 1936. A good crop in 1937 checked imports and in 1937 exports rose to 139,893,000 bu.—a total approaching the record. The surplus of exports continued to 1946.

World corn production ranged from about 4,000,000,000,5,000,000,000 bu. during the 20 years before 1937. By this date the crop had grown to 4,980,000,000 bu. and in 1940 was estimated at 5,054,000,000 bu. Of this total, more than half was produced in the western hemisphere. Supplementing the U.S., Argentina had an average crop of about 350,000,000 bu. up to World War II and Brazil around 230,000,000 bu. In Europe the corn belts are in the lower Danube valley, the Po valley in Italy and in some parts of the U.S.S.R.

The Danube crop averaged about 500,000,000 bu. before the war, Italy about 130,000,000 and the U.S.S.R. 150,000,000 bu. About 75,000,000 bu. per year were raised in South Africa. The crops declined as the war reached the Balkans and Italy. Droughts in 1945 reduced the crop in Argentina and in Italy. In Argentina, corn was so low in price that it was used for fuel during the shipping shortage.

The drought forced South Africa to import corn. The United Kingdom grows no corn (maize) but calls wheat "corn." (See also Agricultural Research Administration; Chemurgy; Vegetables.)

Cornhusking

Regarded as one of sportdom's most interesting and best attended events, the U.S. national cornhusking championship was a wartime casualty. The tournament was canceled in 1942 "to save rubber for war use" and was not held during the rest of World War II. Nor was it revived

in 1946.

Farmers claimed the mechanical picker, making hand picking a lost art, was responsible for the failure to revive the championship along with other sports in 1946.

After reaching its peak attendance of 150,000 at Newark, O., in 1936, the annual cornhusking championship continued to draw crowds in the six figures until it was abandoned in 1942.

Floyd Wise of Prairie Center, Ill., won the 18th annual championship in 1941 at Tonica, Ill., and continued as duration champion.

The world's record of 46.71 bu. of corn husked in 80 minutes was held by Irvin Bauman of Illinois, made in the 1940 tournament. The next best mark was 45.37 bu., established by Wise in 1941.

Bauman husked approximately 4,000 ears in setting his world's record.

Champions after 1936 were: Ray Hanson of Minnesota, 1937; Ted Balko of Minnesota, 1938; Lawrence Pitzer of Indiana, 1939; Irvin Bauman of Illinois, 1940, and Floyd Wise of Illinois, 1941.

Corregidor

When, on Dec. 13, 1941, Japanese troops invaded the Philippines, landing on northern and southern Luzon, an attempt was made to hold them in these regions, but the Filipino army troops were unable to stem the tide of invasion which consisted of several times their own number of better trained, better organized and better equipped troops.

The commander in chief of the U.S. army forces in the far east, General Douglas MacArthur, therefore decided to withdraw his troops to the Bataan peninsula, where a defensive position could be taken up to protect the island fortress of Corregidor, and the three other fortified islands, at the mouth of Manila bay, from assault by land-based troops moving from the Bataan peninsula. Corregidor is the principal island of the four, all of which had been fortified shortly after the turn of the 20th century to prevent hostile ships from entering Manila bay. The other three islands, from south to north, are Carabao (Fort Frank), El Fraille (Fort Dunn), and Caballo (Fort Hughes). The fortifications on Corregidor Island were known as Fort Mills. Corregidor Island lies athwart the entrance to Manila bay from the west and at the nearest point is 3,500 yd. from the southern tip of Bataan, and about 17,000 yd. from the southern shores of Manila bay. It had long been recognized that if an enemy should gain possession of southern Bataan, his heavy artillery fire could dominate Corregidor and the other fortified islands.

The majority of the armament on these islands was initially emplaced to fire to seaward or to the west. Only a few of the heavy artillery pieces had all-around fire which could be brought to bear upon the Bataan peninsula or upon the south shores of Manila bay in Cavite province.

Having withdrawn his troops to the Bataan peninsula, General MacArthur ordered a stubborn defense of that area. This was carried out against greatly superior forces until April 9, 1942, when, overcome by starvation, sickness and troops superior in equipment, training and experience, the Filipino and U.S. troops on the Bataan peninsula were

Paratroopers, supported by ground forces, landing on Corregidor in the combined assault launched on Feb. 16, 1945. Their target was the "Rock," gateway to Manila harbour, which the Allies planned to reopen for U.S. shipping

forced to capitulate. This completely isolated Corregidor and the other fortified islands. The Japanese then moved a great quantity of heavy artillery to the southern shores of Bataan and began a consistent shelling of Corregidor accompanied by heavy aerial bombardment. In spite of this terrible pounding, the defenders of Corregidor held on manfully for 27 long days and nights. Casualties in personnel were heavy, and practically all the heavy armament was destroyed by artillery fire or air raids. The Japanese had excellent observation from balloons and from Marivales mountain and could readily spot the batteries which fired toward Bataan. One by one they were destroyed.

On the night of May 5, at 10:15 P.M., the Japanese assaulted from boats which they had assembled on the southern and western shores of Bataan. There was insufficient armament left upon Corregidor to repel this assault. and the landing was successful. Fighting continued throughout the night, in some places hand to hand, and the next morning until noon. At this time, Lt. Gen. Jonathan M. Wainwright, who had succeeded General Douglas MacArthur as commander in chief of the U.S. forces in the Philippines, decided that further resistance was hopeless and could only end in the complete slaughter of his troops. He therefore asked for a meeting with the Japanese commander in chief in the Philippines and at about 6:00 р.м., at Cabcaben, Bataan, tendered the surrender of the U.S. army forces in the Philippines, to Lt. Gen. Masaharu Homma.

Less than three years later (Feb. 1945) Corregidor was recaptured by a U.S. combined assault. (J. M. W.)

Costa Rica

A Central American republic, bounded by Nicaragua on the N.W., the Atlantic ocean on the N.E., Panama on the S.E. and the Pacific ocean on the S.W. Area, 23,000 sq.mi.; pop. (1944 official est.), 725,149. According to the director-general of the Costa Rican statistical office, a more accurate figure would be 835,000. Earlier pop. ests. were 1940, 656,129; 1941, 668,060; 1942, 687,354; 1943, 706,596. Density for the entire country, by the 1943 estimate, was 36.73. The bulk of the population was located in the small central plateau (meseta central), where the principal cities and towns are situated. The overwhelming majority of the highland population is of Spanish descent, principally Galician and Andalusian. The racial distribution indicates 80% white, 14% mestizo, 4% Negro and 2% Indian. The 22,000 Negroes inhabit the Atlantic coast, centring on Puerto Limón. The capital and principal city is San José (pop. est. 1944, 77,182); other cities (with 1944 pop. ests.): Heredia, 10,578; Alajuela, 10,170; Limón, 10,033; Cartago, 12,933; Puntarenas, 8,547.

Presidents during the decade 1937-46 were: León Cortés Castro, 1936-May 10, 1940; Rafael Angel Calderón Guardia, May 10, 1940-May 8, 1944; Teodoro Picado Michalski, after May 8, 1944.

Toward Improved Economy.—Pres. Cortés made serious efforts in 1937 to put Costa Rica on a more solid economic basis by means of a debt adjustment with foreign bondholders, stimulation of the coffee industry and a reciprocal trade agreement with the United States. The important trade agreement with the United States, effective Aug. 2, 1937, contained many technical provisions designed to stimulate mutual trade; the United States pledged to continue the duty-free admission of Costa Rican coffee, bananas, cacao and other products, and Costa Rica agreed to reduce tariffs on lard, certain meats, fruits and other products imported from the United States. Commercial treaties were negotiated in 1938 with Czechoslovakia and Yugoslavia. The congress in March 1939 levied a 100% duty on goods from countries whose sales to Costa Rica exceeded their purchases by 50% or more. Japan was the chief nation affected.

Proposals made in the U.S. congress early in 1939 that Cocos Island, an uninhabited Costa Rican possession lying 300 mi. off the Pacific coast, should be leased or purchased as a part of Panama canal defenses attracted much attention in Costa Rica; the government in September sent a military detachment to occupy the island to prevent its use by belligerents during World War II, which had just broken out. Costa Rica participated in the first foreign ministers' conference representing the American republics, held at Panamá city in Sept.—Oct. 1939. It vigorously protested soviet aggression against Finland late in the year. Nicaraguan efforts in October to negotiate a treaty with Costa Rica for the canalization of the San Juan river, forming a part of their mutual boundary, proved unsuccessful.

The quadrennial presidential election, held Feb. 11, 1940, resulted in placing in office Dr. Calderón Guardia, who was inaugurated May 10. During his administration

Costa Rica continued to maintain very cordial relations with the United States and to co-operate closely with hemisphere defense measures. Strong public demonstrations in June against Italian entry into World War II indicated general popular support of the government's policies. Costa Rica was also an active participant in the second foreign ministers' conference, held at Habana, Cuba, in July 1940.

The country was hard hit economically by European war conditions, especially through loss of European markets for its coffee, but continued banana development in the Parrita-Quepos region, involving an annual influx of more than \$3,000,000 in new capital, helped to modify the economic crisis. It was said that the new plantations were the most scientifically prepared of any in the world. The precarious state of the coffee industry, Costa Rica's chief economic reliance, was somewhat improved by the Inter-American Coffee Quota agreement of Nov. 28, 1940, aimed at the orderly marketing of coffee and the adjusting of supply to demand. The agreement allotted Costa Rica a basic quota of 200,000 bags of 60 kg. each for export annually to the United States, although the subsequent annual adjustment of quotas permitted a greater export figure; the 1936 export had totalled only 104,036 bags. Costa Rica in Oct. 1940 created a coffee quota committee to estimate annual domestic requirements, establish minimum prices for exports and assign quotas among domestic exporters.

Strongly Pro-Ally.—Costa Rican public opinion throughout 1941 was strongly Pan American and antiaxis, in keeping with the country's democratic tradition. The government in January banned the dissemination of totalitarian propaganda through the mails and deported two Germans in May on charges of proaxis activities. These and other antiaxis measures, including seizure of axis ships in Costa Rican ports in May, led to a German demand in August for withdrawal of Costa Rican consuls from German-dominated areas. When Japan attacked Pearl Harbor in Dec. 1941, Costa Rica's declaration of

Costa Rica, the first nation to declare war on Japan after the Japanese attack on Pearl Harbor in 1941, followed this act with the seizure of Japanese fishermen and cotton planters, shown below in a prison at San José war against Japan on Dec. 8 preceded that of even the United States by a few hours; war was declared on Germany and Italy on Dec. 11. Defense measures involved close co-operation with the United States. Costa Rica obtained a U.S. credit of \$500,000 in June for purchase of war materials, and 2 months later an agreement authorized the sending of a U.S. military mission. The Export-Import bank granted a \$4,600,000 loan in 1941 to advance the work begun on the Costa Rican portion of the Inter-American highway and to stabilize Costa Rican currency. The government reached an agreement with Panamá delimiting the common boundary and thus ending a long-standing controversy between the two republics; some opposition to the settlement persisted in Costa Rica.

On Jan. 30, 1942, the government approved the joint declaration of the United Nations and in May it severed diplomatic relations with Rumania and Hungary. The sinking of a vessel within the harbour of Puerto Limón by a submarine, presumably German, resulted in antiaxis riots and the arrest of several suspects. The national emergency resulted in a suspension of constitutional guarantees on March 5, for a 60-day period; the state of siege was further extended in June. The government early in the year created a national civilian defense board to concern itself with problems of defense preparations. An office of price investigation and control was established March 27 to deal with prices and the supply of commodities. Under the direction of this agency the reexport of manufactured articles was prohibited; it also took over the regulation of the price and production of such items as drugs, livestock, metals, oils and fats, corn, beans and rice. Fear of misuse of U.S. currency by axis agents resulted in the prohibition of both import and export of such currency, and the national bank of Costa Rica took over supervision of all foreign exchange Government agencies and the fruit companies backed efforts to increase production of abacá and rubber, both to encourage production of strategic materials and to substitute for the 30% loss in revenue caused by reduction of banana exports.

An especially significant development of 1943 was an

agreement in March by which the United States was given a lease on 10,000 ac. of land for growing cinchona for production of quinine. A formal agreement was arranged late in the year for U.S. purchase of all suitable balsa wood that Costa Rica could produce. Serious advances in prices early in the year resulted in a drastic decree designed to curb profiteering; penalties for profittaking of more than 20% ranged up to 6 months in prison. Shortages of many items continued but conditions improved in the latter half of the year, and by September price levels had dropped slightly. Both Mexico and the United States raised the rank of their diplomatic representatives from minister to ambassador.

Certain constitutional guarantees remained suspended. A new labour code introduced in April 1943 was opposed by conservatives but was passed by the congress in November and added to the constitution as a series of amendments. Much interest developed in 1943 over political alignments made in prospect of the presidential election scheduled for Feb. 1944. The leading candidates were former Pres. León Cortés Castro and Teodoro Picado, president of the congress. Picado had the support of the National Republican (administration) party and was also backed by the Vanguardia Popular, the renamed Communist party. Electoral reforms were proposed in the spring but were objected to on the ground that one candidate would be favoured by them; the proposed laws were withdrawn in June. In the same month the Communist party was disbanded, in line with the ostensible dissolution of the third international, and in its place was organized the Vanguardia Popular with, however, the same leadership, membership and ideology. Soon afterward Archbishop Víctor Sanabria, head of the Catholic hierarchy, announced that Catholic workers could hold membership in the Vanguardia, though not in fascist or nazi organizations.

Construction of international highways through Costa Rica proceeded rapidly. The Inter-American highway, from the U.S. border to the Canal Zone, had been under construction for some years, but in 1942 the U.S. war department concluded that as a military emergency a road should be hastened to completion, partially following new routes. Costa Rica was more vitally affected by such a plan than any other Central American country since more of the uncompleted route was in Costa Rica than in any other of the republics. Work was suspended in Sept. 1943 after the military situation and the submarine threat eased. In hearings held before a U.S. senate subcommittee in Los Angeles, Calif., in Sept. 1946 it was brought out that the route being constructed under auspices of the Public Roads administration had undergone one detour in Costa Rica in order to bring it past a ranch owned by the Costa Rican president. It was also charged that political pressure caused an "access road" to a cinchona plantation to be constructed in Costa Rica at a cost of \$340,000 and that the international highway had to cut across a mountain in that country because it otherwise might have competed with a government-owned railway.

Conditions in Costa Rica in 1944 were more disturbed than for a long time previously, partly because of the general wave of unrest and revolutions that swept through Central America during the year. The elections on Feb. 13, 1944, were designed to choose a new president and half of the members of the congress. By the beginning of 1944 it was obvious that a rumoured "deal," by which Calderón Guardia would bring about the election of Cortés as his successor with Picado being placated by being allowed to designate certain cabinet members, was unfounded. It was widely charged during the campaign that Cortés had the support of nazi sympathizers in return for his own friendliness for that group. A Mexican journalist was quoted as saying that profascist groups were

planning an armed uprising. Vicente Lombardo Toledano, Mexican labour leader, charged on Feb. 1 that shipments of arms and munitions were being clandestinely introduced into Costa Rica in preparation for a revolution. Lt. Gen. George H. Brett, commander of the Caribbean defense forces, denied that U.S. units were participating in a reported naval patrol to prevent such arms smuggling. A gun battle on Feb. 7 at San José was said to have resulted in the death of 1 person and injury of 42. Other disorders took place, especially in the capital, and the situation continued tense until the election.

As was anticipated, Picado was declared the winner, the final count being reported as 78,341 for Picado to 42,646 for Cortés Castro; 14 supporters of Picado and 9 of Cortés were elected to the congress. The opposition made many charges of pressure and intimidation by the government in favour of Picado. Three days after the election Pres. Calderón Guardia released all those who had been imprisoned for "political agitation" during the campaign. (R. H. FN.)

The Picado Administration.—When Teodoro Picado Michalski assumed office on May 8, 1944, he made the following declaration of foreign policy before the congress:

Let us take this opportunity to reiterate our faith in the victory of the democracies; and pay homage again to their leaders as well as their armies, and in general, their people, who suffer unheard of privations and make untold sacrifices so that a regime of barbarity and oppression does not enthrone itself in the world.

The government adhered to its principle of consulting the other American countries in the matter of the recognition of governments which had risen by force; this was in agreement with the recommendations of the Emergency Committee for Political Defense of the Hemisphere as set up in Montevideo, Uruguay. The same procedure was followed with regard to the recognition of the Italian government headed by Ivanoe Bonomi.

Of special importance to Costa Rica was the end of the demarcation of its borders with Panamá on Sept. 18, 1944, based on the treaty of May 1, 1941; the government of Chile had acted as mediator. Costa Rica re-entered the International Labour organization and was represented at the Montreal conference in 1944.

The resolutions of the Conference of Chapultepec (Mexico) on the problems of war and peace, held in Feb. 1945, were accepted in accordance with constitutional practice. Julio Acosta, a former president of Costa Rica, and other distinguished delegates took part in this conference, as well as in the consequent assembly of the United Nations at San Francisco.

Costa Rica subscribed to the International Monetary fund and the Bank for Reconstruction and Development created in 1944 and was represented at the United Nations conference in London.

In agreement with a resolution adopted at the Conference of the Ministers and Directors of Education of the American Republics in Panamá in 1943 the government signed a convention with the Inter-American Educational Foundation, Inc., to create a better understanding between Costa Rica and the United States through an exchange of educative ideas and methods.

The administration of Pres. Picado, a former minister of public education, paid special attention to problems of education. Legislation was improved in this respect-teachers' salaries were increased, rural schools were encouraged, state and private secondary schools adopted better curricula, an institute was founded in the province of Guanacaste, the National Institute of Physical Geog-

raphy was reorganized on a firmer basis, the system of scholarships was greatly increased and the work of cultural missions in rural schools was organized.

All possible attention was paid to public health. In this task the Co-operative Inter-American Public Health service of the United States provided valuable assistance.

The government likewise occupied itself with the planning of agricultural production so that the economic life of the country would no longer depend exclusively on certain products, and an equilibrium in production could be obtained. A reform of customs regulations was adopted; a close survey was made of the activities of the Costa Rican Commission on Inter-American Development, the Coffee Control institute and the Cane and Beet Sugar commission.

A notable characteristic of Picado's administration was its attempt to consolidate democratic institutions, guarantee republican life and fully respect civil liberties. In his desire to perfect the system of popular vote the president entrusted members of the supreme court of justice with the formulation of an advanced plan in this respect; and an electoral code was issued later on to guarantee freedom of expression. A constitutional reform was also adopted to fix the basis of civil service in Costa Rica.

Cotton

Both the production and consumption of cotton were at a record level in 1937. The world's crop was estimated at 98,625,000 bales after a steady increase from about 20,000,000 bales in 1923. The increase was principally in the United States, China, U.S.S.R., Egypt and Brazil. The world's crop dropped off after 1937 to an average of about 27,000,000 bales in 1938-44 and 24,500,000 bales in 1945. After 1940, estimates were without data from China and the U.S.S.R. and could be higher. Consumption was running below the declining production. During World War II, the high level of consumption in the U.S. about offset the smaller consumption in other countries. World consumption was estimated at 31,000,000 bales in 1937 and 24,000,000 bales in 1945. Countries devastated by World War II had reduced mill consumption and lacked exchange to buy raw cotton or fuel for the mills. Stocks were increasing abroad wherever shipping was available, although world stocks of all kinds were estimated to be lower in 1946 than a year earlier. Mill consumption as a whole was estimated to be 4,000,000 to 5,000,000 bales below the prewar average. The U.S. arrangement whereby payment for raw cotton was accepted in the form of finished goods helped meet the shortage of exchange in some countries.

The production of the world's cotton crop was changed by the wartime need for more food as well as by the reduction of cotton manufacture, particularly in Europe. In 1937 production was as follows: U.S. about 19,000,000 bales; India 4,700,000 bales; China 3,500,000 bales; U.S.S.R. 3,700,000 bales; Egypt 2,200,000 bales; Brazil 2,000,000 bales; and Peru, Mexico, Argentina, Uganda and the Sudan each less than 375,000 bales. By 1944, out of a total

world crop about 12,000,000 bales smaller, the reported production of the principal countries was: U.S. 12,200,000 bales; India 2,955,000 bales; China and U.S.S.R. unreported; Egypt 960,000 bales; Brazil 1,400,000 bales; and the other countries a smaller total. The only increases in the decade were in Mexico and Argentina. The world cotton trade as a whole was estimated to be about 5,000,000 bales less in the 1945-46 season than in the prewar period 1935-39. The British announced early in 1946 that the Liverpool Cotton exchange would remain closed as it had been during World War II, and that all imports would continue to be handled by the government. The Indian Central Cotton committee recommended that acreage be held at the reduced level of about 60% of the prewar acreage in order to foster food production. This action would return a crop of about 2,800,000 bales, compared with more than 4,000,000 bales produced in the period 1935-39.

The International Cotton Advisory committee met in Washington, D.C., in May 1946, with 27 cotton-producing and -consuming countries represented. While an international cotton agreement was not made, the resolutions recommended that an executive committee establish central offices to keep the world cotton situation under continuous review by collection of statistics and reports, exchange of information, co-operation with the United Nations Food and Agriculture organization, and by calling meetings of the advisory committee whenever necessary. The F.A.O. set up a fibre unit to begin the study of methods of improving the efficiency of production and distribution of cotton in all of the United Nations. While the F.A.O. was concerned first with food production, its charter covered all of agriculture and the importance of cotton brought it first attention.

United States.—The U.S. cotton crop underwent several remarkable developments during the decade 1937-46. A constantly shrinking acreage was accompanied by almost steady increases in yields which maintained total production at a fairly stable level followed by a decline almost to the lowest level of 50 years. A comparatively low price for a large crop in 1937 was followed by price increases to

Mechanical cotton picker, designed to do the work of 50 to 80 labourers, being demonstrated in southern U.S. during 1945

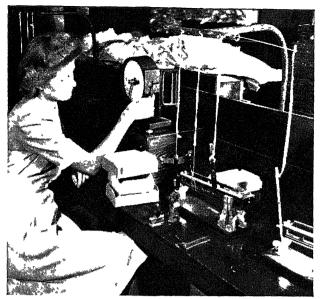

a high level during World War II which resulted in a total value to producers more than double that at the beginning of the decade. These unusual changes were the result of favourable weather for production together with the influence of government actions and the stimulus of war demand.

An all-time high record production was harvested in 1937 when the crop was estimated at 18,946,000 bales of 500 lb. gross weight. Previous to that year total production had reached 17,000,000 bales only in 1926 and 1931. The highest production in the period of World War I was 16,112,000 bales in 1914, followed by crops averaging about 11,400,000 bales. After 1937, production declined to an average of 11,700,000 bales in 1941–43, and to the very small crop of 9,015,000 bales in 1945, the smallest after 1921. Except for the year 1921, when boll-weevil damage brought the crop down to 7,945,000 bales, the 1945 crop was the smallest after 1896.

The acreage planted to cotton in the U.S. increased steadily for a long time to about 36,000,000 ac. in 1918. A decline in 1921 was due to heavy damage by boll weevils which reduced these crops more than 20% from a full yield. Additional cotton areas in the western part of the cotton belt brought a total increase in acreage during the period 1921–26. After 1926 there was a gradual decline in acreage to the low point of 17,688,000 ac. in 1945, and 18,179,000 ac. in 1946. The acreage in 1945 was the smallest harvested after 1884; the largest acreage, nearly 46,000,000, had been planted in 1925. The cotton belt farmers shifted much of their area to food and feed crops, oil seeds and truck.

The trend of yields of cotton per acre remained at about the same level from 1900 to 1914, at around 180 lb. per acre. Then followed a decline from 1914 to 1923 caused by boll-weevil damage and the shifting of cotton-growing to lower yielding areas. A low point was reached in 1921, when the average yield was only 132.5 lb. per acre. Beginning in 1937, new high record yields were harvested, as follows: 1937, 269.9 lb. per ac.; 1942, 272.4 lb.; 1944, 293.3 lb.; 1945, 253.6 lb.; 1946, 230.7 lb. It is noteworthy that these yields, averaging 231 lb. in 1934-43, were almost 100 lb. per ac. above the low output of 1921. The increases were due to the fact that more of the crop was grown on higher-yielding soils; as acreage was reduced the poorer lands were abandoned first. Weather and boll-weevil damage were about the same after 1938 as in the previous decade. Losses from these causes were notably small in 1937. Another factor was fertilizer, which was used on about 37% of the area planted in pre-World War II years, while in 1941-43, 45% of the crop was fertilized. The rate of application also increased from 273 lb. in 1935-39 to 297 lb. in 1941-43. It was estimated that a ton of fertilizer increased cotton production 1.7 bales. Better yields also were secured from improved seed, and the increased use of legumes as green manure. A summary of the factors causing better yields attributed the gain of 40 lb. per acre to: fertilizers 15 lb.; use of better land 9 lb.; favourable weather 3 lb.; less disease damage 1 lb.; better seeds and general culture 12 lb. The amount of commercial fertilizer used per acre increased from 280 lb. in 1937 to about 325 lb. in 1946. The percentage of the crop fertilized also increased from 36.7% in 1937 to 47.9% in 1946. The total tonnage of fertilizer used was about 1,500,000 during the decade-below the 2,200,000 tons used in 1928-29, when the total acreage of cotton was twice as large. Greater boll-weevil damage in 1941-43 reduced yields about 12 lb., leaving a net gain of 28 lb. per ac. Improved soil conservation practices introduced

Breaking strength of cotton fibres being tested at a U.S. department of agriculture laboratory, Stoneville, Miss., in 1943

after 1936 also contributed to the better cotton crops.

The shift in cotton production to the western part of the cotton belt began about 1915. In the eastern coastal plains the growing of more peanuts, vegetables and feed crops decreased cotton acreage. During the decade 1937-46 the proportion of the production in the delta region increased most rapidly. The coastal plain share declined more than any other region, the Piedmont only slightly. In the west the Texas blacklands produced less, as did the Ozark hills and Oklahoma prairies. In the irrigated areas the acreage of cotton increased until 1937 to about 1,125,-000 ac., then declined to about 750,000 in 1941-43, because of the growing demand for vegetables and alfalfa. The acreage of American-Egyptian cotton was encouraged by the government in 1942, and about 165,000 ac. was planted. But when it became apparent that this cotton was not so urgently needed in 1944, the acreage was reduced to about 14,000 ac. and in 1946 to only 2,700 ac.

The development of new machines for cotton culture and harvesting proceeded slowly during the decade 1937–46. The tractor was introduced for plowing and cultivation, but the general-purpose cotton picker remained in the testing stage and did not come into widespread use. A new type of flame thrower to destroy weeds was tested. The agricultural experiment stations and farm implement manufacturers continued tests during World War II, and many new machines were promised for postwar manufacture. These experiments indicated that machines could

*December estimate.

reduce the man labour to less than one-fifth the amount required by the one-row mule plow and hand picking. The introduction of machinery proceeded much more rapidly in the level delta areas than in the hill country and was expected to increase the advantages of cotton culture in these areas. The use of the aeroplane for dusting cotton for boll-weevil control continued to improve in the level areas. The estimated reduction from a full yield by boll-weevil damage ranged from 5.3% in 1937 to a high of 15.4% in 1941; it then declined to 3.9% in 1944, and rose again to 6.5% in 1946. Losses from plant diseases and insects other than boll-weevil accounted for losses of from 3% to 5% during the decade.

The record of cotton prices to producers during the decade was one of steady rise after 1937, when the average was estimated by the U.S. department of agriculture at 8.41 cents per lb., to 37.69 cents in Oct. 1946. This price exceeded the previous record in 1919, when the average to producers for the year was 35.3 cents per lb.

The government resumed making loans in 1937. In March 1938 the Agricultural Adjustment administration held a referendum of growers, who voted 92.1% in favour of restricting acreage for benefit payments and loans. This was repeated in 1939, when 85% of the growers favoured the plan. By the end of 1938, the government held a loan stock of 10,400,000 bales from the crops of 1934-37 and 1938. The crop was restricted through 1940 and 1941. In 1942 and 1943 the government urged the planting of peanuts, soybeans and feed crops in place of cotton and less short-staple cotton. The U.S. had on hand almost a twoyear's supply of short-staple cotton in 1942-43. By 1945 the government was suggesting only 20,000,000 ac. for 1946 with loans at 921/2% of parity on upland cotton as of Aug. 1946. Stocks had been reduced to the smallest since 1937.

The carry-over stock of cotton as of Aug. 1 began to be large in 1938. Up to 1937 these stocks had declined in amount each year, from 9,678,000 bales in 1932 to 4,499,000 bales in 1937. In 1938 the carry-over was 11,533,000 bales; in 1939, 13,033,000 bales and from 1940 to 1946, an average of about 11,000,000 bales. These stocks were about equal to the annual crops and larger than total consumption of U.S. cotton in both domestic and foreign mills. Domestic consumption in 1937 was 5,616,000 bales, increasing to 10,973,000 bales in 1941, the peak of cotton manufacture, followed by a decline to 9,456,000 bales in 1944. Without government price supports, the large stocks would have greatly depressed prices.

The total consumption of cotton was estimated to be 2,855,000,000 lb. in 1937, 5,492,000,000 lb. in 1942, the highest quantity of any year in the decade, and 4,749,000,000 lb. in 1944. On a per capita basis the consumption was: 21.9 lb. in 1937; 40.2 lb. in 1942 and 34 lb. in 1944.

In 1939 about 16.4% of the carry-over consisted of low quality short-staple cotton amounting to 2,100,000 bales. By the end of 1944, about 21.5% consisted of this short-staple cotton because of the end of German and Japanese demand for this low-quality stock. Prices advanced for the long cotton compared with the short-staple and price differentials widened.

Exports of cotton were 5,595,000 bales in 1937 and declined to 1,112,000 bales in 1940 but increased to 2,006,000 bales in 1944 and to 3,250,000 bales in 1945. France became the largest buyer. The first postwar shipments to Japan began in March 1946, under U.S. supervision to sell the textiles provided in payment for the raw cotton. The

destination of shipments and amounts exported in 1945 was as follows: France 347,569 bales; Canada 125,162 bales; United Kingdom 121,671 bales; Spain 73,883 bales; Poland 63,903 bales; Yugoslavia 47,541 bales; Czechoslovakia 37,248 bales; Switzerland 14,347 bales; and all other countries 92,000 bales.

Cottonseed production varied with the size of the cotton crop, but its price and value were affected by the strong demand for vegetable oils. The average price of cottonseed rose from \$19.50 per ton in 1937 to \$52.70 in 1944 and then declined slightly in 1945-46. The output of oil held fairly constant after 1937 at around 1,300,000,000 lb., and the price more than doubled, from 6.6 cents per lb. in 1937 to 13.7 cents per lb. in 1946. The demand for the meal for feed caused its price to more than double during the decade. The amount of the cottonseed left on farms declined as the price advanced, and less seed was exchanged for meal by the farmers. The U.S., once an exporter of cottonseed oil, shipped little or none during the war years. The principal exporters were Brazil, Egypt and British-controlled areas in East Africa. (See also CHEM-(J. C. Ms.)

Manufacture.—The decade 1937–46 arrested certain deflationary trends in the economy of cotton manufacture in the world and the U.S., but produced other circumstances to aggravate and accelerate those trends, when competitive factors once again had rein. World War II placed cotton manufacture in a sort of vacuum, just as it did to so many branches of industry.

The most important influences tending toward liquidation of segments of the cotton-manufacturing industry in the first part of the decade were: (1) competition from synthetics and other materials; (2) technological progress on several fronts; and (3) geographical dislocation of the industry both within a country and in the world as a whole.

Wartime research produced results which, while improving cotton's performance, gave a long-term net advantage to synthetics, both in the versatility of the fibres themselves and in the technique of processing them. In addition, nonindustrial nations out of the war zone entered cotton manufacture or improved their position in that field.

The problem facing the industry at the end of the decade could be summarized as follows: cotton manufacturers in general had to decide whether they could adjust themselves to the broader role of textile manufacturers without primary emphasis on the type of fibre processed, or face the possibility of eventual liquidation. Cotton manufacturers in a country like the U.S., with high wage levels and standards of living, had to decide whether they could yield their place in production of cheap staple goods to newly industrialized countries and develop instead the specialized and styled types of products with wider profit margins. If they could not make these adjustments, they might follow the down-hill road taken by silk manufacturers after World War I.

A clear picture of the deflationary trends which were at work in the industry prior to World War II may be secured by a comparison of the decade 1937-46 with the preceding decade. The excellent statistics maintained by the Association of Cotton Textile Merchants of New York made possible such a case study for the U.S.

At the start of the first of the two decades—that is, in the beginning of the year 1927—spindles in place totalled 37.364.730, or nearly the peak for the country. Each year

during the ensuing decade this total declined, until at the beginning of 1937 it was 27,573,770, a drop of about 10,000,000 spindles. The first years of the next decade, 1937–46, continued the peak rate of decline, but this was arrested in 1940 as the result of the defense program; and in the last war year, 1945, there was an actual increase of 700,450 spindles in place, the first increase in 20 years. At the start of 1946, the total was 23,806,392 spindles.

These figures on equipment in place contrasted with those on production of cotton goods. In 1927, the output in the U.S. was 7,936,942,000 sq.yd.; in 1937, it was 9,445,-914,000 sq.yd.; and in 1945, production totalled 9,779,238,-000 sq.yd. In other words, despite a decline of 10,000,000 spindles (or about 25%) in the first of the two decades, output of goods increased about 15%; while in the next decade, a decline of about \$600,000 spindles was again accompanied by an increase in production.

In fact, in the peak year 1942, production of cotton goods was 12,204,611,000 sq.yd., an increase of nearly 50% over 1927, while equipment in place in 1942 was one-third less than in 1927.

The reasons for this paradox were, primarily, technological improvement and increase in hours run per spindle in place. On the latter point, it is revealing to note that in 1937, hours run per spindle in place were 3,962, going up to a war peak of 5,793 in 1942. This fact must be emphasized: World War I changed a large part of the industry from a one-shift to a two-shift basis, while World War II introduced a third shift. If the latter was to become a part of the industry's routine, potential over-production would again be a threat.

The supply of synthetic fibres was controllable by man whereas cotton was still subject to the whims of nature. Similarly, the characteristics of synthetic fibres, and therefore their performance, were limited in versatility only by the limitations of man's ingenuity, and the latter had certainly not stopped working.

However, cotton manufacturers did not accept the implications of this advance in synthetics, and of the competition from paper and other products, complacently. Important research and promotion activities resulted in new cotton products, new finishes and new methods of merchandising. But it must be re-emphasized that the long-term odds were against those manufacturers who tied their future exclusively to cotton as a raw material. Cotton has a certain structural rigidity which limits the changes man can make in it.

The new and completely synthetic fibres, on the other hand, started with no such handicap.

Cotton would continue to supply the bulk of the world's textile needs for some time to come. That much was certain. However, it was equally certain that it had no assured monopoly on that position. Its priority, which was reinforced by wartime shortages during the "ten eventful years," would be challenged again in the decade ahead. Coventry

City, county and parliamentary borough of Warwickshire, England, Coventry is 94 mi. northwest of London. Pop. (estimated) (1939) 225,000; (1946) 235,000.

Much happened in Coventry between the years 1937–46. During World War II, its factories were busy turning out products for all the three services and, according to Winston Churchill, more equipment was being produced per yard of space in Coventry than in any other industrial place in the country. In addition to the existing factories, which in peacetime manufactured motor cars, engineering products and electrical equipment, and sent them to all parts of the world as well as providing for the home market, the government erected six shadow factories for the manufacture of aero-engines.

This resulted in a large influx of workers from all parts of the country and created heavy billeting problems, until the government sponsored the erection of hostels, some of which were later converted into workers' dwellings, lodgings for married couples and training places for future teachers.

None will forget the terrible German air attacks on the city on Nov. 14-15, 1940, and April 8-10, 1941, when several hundred people were killed and many thousands injured. There was much destruction and damage of property, including the complete destruction of the great Coventry and Warwickshire hospital and partial destruction of the cathedral.

In all raids on Coventry, the total number of persons killed was 1,236.

Coventry was one of the first "blitzed" cities to plan its future. By the new plan it was intended that there should be higher buildings and more open spaces. The object was to avoid congestion on both streets and pavements. The scheme was for "neighbourhood units" grouping together similar activities. Historic buildings which had not been completely destroyed, such as the cathedral and St. Mary's hall, would be preserved and worked into the plan.

From the cathedral across the old Broadgate there would be a vista westward to the new shopping centre, markets and offices; to the south and east of the cathedral there would be civic buildings, such as police and law courts, town hall, library and museum and institute for adult education. The existing council house would remain.

Craigavon, James Craig, 1st Viscount

Viscount Craigavon (1871-1940), Irish statesman, was born in Craigavon, County Down, Ireland, Jan. 8, 1871. After service in the Boer War, 1899-1902, he was elected to parliament in 1906. In 1919 he became parliamentary secretary to the ministry of pensions, and the following year financial secretary to the admiralty. He became first prime minister of Northern Ireland in 1920, when the

new Government of Ireland act went into effect. Created viscount in 1927, he continued as prime minister until his death, at Glencraig near Belfast, on Nov. 24, 1940.

Crerar, Henry Duncan Graham

Crerar (1888—), Canadian army officer, was born April 28, 1888, in Hamilton, Ont. He was educated at Upper Canada college at Toronto and the Royal Military college, Kingston. Commissioned a lieutenant (1910), he served in France during World War I, attaining the rank of lieutenant colonel. He was a general staff officer attached to the British war office, 1925, later becoming director of military operations and intelligence in Canada's department of national defense.

Promoted to brigadier general and sent overseas at the outbreak of World War II, he was subsequently named a lieutenant general but voluntarily stepped down to major general in order to take command of a Canadian division in Britain. Gen. Crerar, who became a corps commander on April 6, 1942, led the 1st Canadian army corps fighting with the British 8th army in Italy and on March 21, 1944, he was made commander of the 1st Canadian army in England. Several Dutch and Polish units as well as two Scottish divisions were incorporated in Crerar's army command.

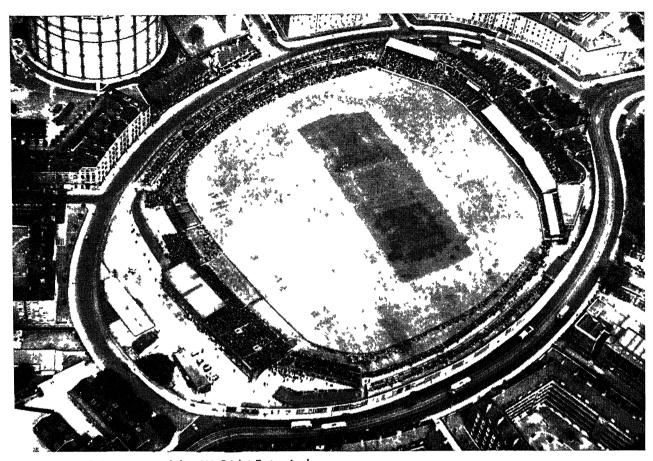

The Canadian 1st participated in the invasion of western Europe in the summer of 1944 and fought alongside the British 2nd army in the Falaise-Argentan sector. After Patton's break-through at St. Lo, Crerar's troops pierced the German right flank and crossed the Seine, retaking several coastal ports in northern France.

On Nov. 20, 1944, it was announced that Crerar had been raised to the rank of a full general. On March 22, 1945, his forces in conjunction with the British 2nd opened a drive between Arnhem and Duesseldorf. They marched northward into the Netherlands and Germany. Crerar's 1st then cut off German escape routes in the Netherlands. As the war ended Canadian and British forces had swept northward to Bremen and Hamburg.

Cricket

Despite the banking clouds of political anxiety in Europe, the sun shone steadily on cricket in the years immediately preceding the outbreak of World War II. The English team which, under G. O. Allen's captaincy, visited Australia in the winter of 1936-37, though it lost the rubber after winning the first two tests, completely restored the happy atmosphere of the game which had been jeopardized by the "body-line" controversy of the previous tour. Unlucky in illness and injury and somewhat unreliable in batting, though W. R. Hammond and M. Leyland did well, they could not in the long run hold out against the dominance of D. G. Bradman's batting and the persistence of W. J. O'Reilly and L. Fleetwood-Smith with the ball.

The season of 1937 was marked by the 150th anniversary of the foundation of the Marylebone Cricket club, which was celebrated in London by a memorable week's cricket at Lord's and a dinner presided over by the duke of Gloucester. Other highlights of the summer were pro-

Kennington Oval, Surrey, scene of the 1938 Cricket Test series between England and Australia, Aug. 20–24. England won the last match by the most decisive margin since the first international series in 1876

vided by a visit of a New Zealand team which played England to a draw in two out of the three test matches, and by the first women's matches between England and Australia in which the mother country was successful and the standard of technique impressive, with Miss M. Maclagan altogether outstanding as an all-round player.

The Australian team that visited England in 1938 retained the "Ashes," but they owed far too much to two men, Bradman and O'Reilly, to be ranked with some of the great combinations of the past. Despite the burden of captaincy which he sustained admirably, Bradman had a marvellous season, scoring 13 hundreds, one of them the decisive factor in his side's victory in the hard fought and low scoring game at Lord's. O'Reilly toiled with superb accuracy and courage, but the support he received was thin. In the drawn games at Nottingham and Lord's, in their victory at the Oval (Manchester was washed out), the English side proved itself possibly as strong in batting as any in history: E. Paynter's 216 in the first was countered by an innings of 232 of astonishing brilliance by S. J. Mc-Cabe, as was Hammond's 240 at Lord's by W. A. Brown's 206 not out (he had then defied England's bowling in two consecutive tests for 12 hours and had been out only once): some fast bowling by E. L. McCormick got England into trouble for a time from which D. Compton, who had made a century in his first test innings at Nottingham, retrieved them with a masterly 76 not out. The Oval match was at once a portent and a tragedy: England's total of 902 for 7 wickets, L. Hutton's 364 in 131/2 hours of faultless batting, his second wicket stand of 382 with Leyland (187) and sixth wicket stand of 215 with J. Hardstaff (169 not out),

were all records, but from the moment when Bradman twisted his ankle and was carried off the field the match was dead, and except for Brown, who batted right through their first innings, the Australian batsmen showed little stomach for an inevitably lost fight.

In the winter of 1938, England under Hammond's captaincy visited South Africa. For the first time in that country all the tests were played on turf wickets, and these proved so favourable to run-getting that only one of the five matches was finished, when England won the third at Durban by an innings. With South Africa still able to draw the rubber, the fifth match was to be played to a finish, but produced such an orgy of runs and at so slow a pace that it had in the end to be abandoned if the English team were to catch their boat home. Scoring 530 in their first innings, South Africa ultimately set England 696 to win, and when time foreclosed the Marathon with players and spectators alike almost too tired to think, England had reached 654 for five wickets, and it was to be hoped the last nail had been driven into the coffin of timeless cricket. Throughout the tour the English batting was powerful. Hammond averaged 87, Paynter made three centuries in the tests with 243 in the third as a record for the series, W. J. Edrich redeemed a lean run by 219 in the final innings and Hutton was consistency itself. For South Africa their captain, A. Melville, and P. G. van der Byl did well; but the bowlers on both sides had a hard task, even Hedley Verity's 19 wickets costing him 29 each. Financially the tour was a great help to South African cricket.

In the summer of 1939, a West Indian team visited England. Though they lost the only one of the three test matches brought to a conclusion when England beat them at Lord's, they played excellent cricket. In G. Headley they had a great batsman who, with 106 and 107, made

history by being the first man to make two centuries in a test match at Lord's. Leary N. Constantine and C. B. Clarke did well in attack and the former, perhaps the greatest entertainer that the game had known, hit so devastatingly for 79 in the Oval test as to reduce the English bowlers to utter impotency. R. S. Grant proved a popular and excellent captain; Hutton scored 196 in the Lord's game and 165 not out at the Oval.

The county championship in England during the years 1937-39 was dominated by Yorkshire with a well balanced and highly disciplined side under an astute and determined captain in A. B. Sellers; its bowling, with Verity and W. E. Bowes the protagonists, was much the strongest in the country, and it was always supported by an aggressive and well-placed field. Middlesex in each year was runnerup, and Gloucestershire in 1939 enjoyed a triumph in twice beating the champions and finishing third in the table. G. W. Goddard was perhaps the best bowler in England in the latter half of the season. In the representative matches at Lord's, the Gentlemen enjoyed a triumph in 1938 when they beat the Players for only the second time after 1914, but in the two other years they were outclassed. Oxford had a strong side in 1937 and won the university match easily, but Cambridge came near to upsetting all form next year when only rain robbed them of victory, and in 1939 they fought a most gallant rear guard action to get to within 45 of the 430 runs set them in the last innings. In this year too Harrow gained their first victory over Eton after 1908.

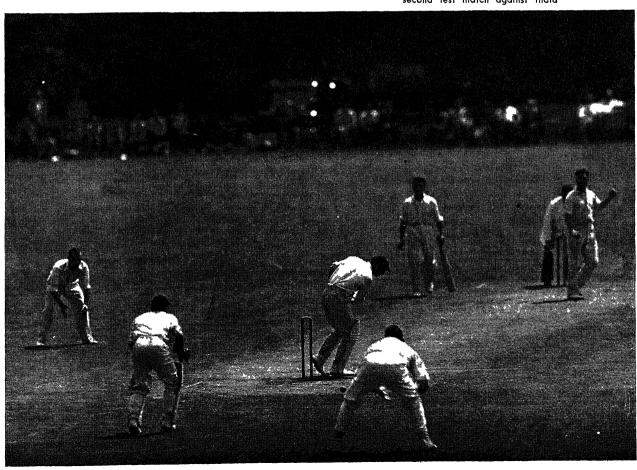

Other features falling within the years 1937-40 were tours of English teams in India, Canada and Argentina, a new record by Bradman who in the winter of 1939-40 made 1,062 in Sheffield shield matches with an average of

132, and an adjustment of the leg-before-wicket law in favour of the bowler (1937).

The onset of war put a summary end to first-class cricket in England, but the game survived vigorously in the schools, in the leagues and in the activities of the British empire and London counties' elevens, the former very amateur, the latter largely professional; their matches raised large sums for war charities. Air raids did heavy damage to the Oval, Old Trafford and Sheffield grounds, but the M.C.C. and county clubs continued to enjoy the loyal financial support of their members. In 1941, thanks largely to the energy and optimism of Sir Pelham Warner, who was acting as secretary at Lord's, there were four oneday matches between the army and royal air force at Lord's, and this policy was steadily developed. In 1943, huge crowds saw England beat the dominions by eight runs, while in that year and in 1944 the enthusiasm and skill of the royal Australian air force side further whetted the public appetite.

In 1945 the M.C.C. and the service authorities organized five "victory tests" between England and Australia (not to be included in the regular series), which evoked cricket of high class and tremendous public interest; each side won two games, while the third, which broke all attendance records at Lord's, was drawn. Features of the cricket were the fast bowling and the splendid driving of the Australian, K. R. Miller, the all-round play of D. R. Christofani and the fine batting of Hammond and Hutton. The

Final test trial at Canterbury, on July 12, 1946. Twelve men from among those playing were chosen to represent England in the second test match against India

season ended with a game between England and the dominions in which the latter won by 45 runs, and Hammond and Miller gave an unforgettable exhibition of hitting. A representative committee appointed by the M.C.C. during the war to consider the future of cricket pronounced against any alteration in the laws of the game in favour of three-day matches and above all urged enterprise and energy in its control by the captains.

In 1946, the game was resumed on prewar lines with great enthusiasm. In spite of wretched weather, attendances and membership were encouraging, and there was much cricket played. An eleven from India, under the Nawab of Pataudi, did well, considering the adverse weather, to play England to a draw in two out of the three tests, though they lost the Lord's game easily enough. In V. M. Merchant they had a great batsman, in L. Amarnath, and V. Mankad a pair of bowlers better than any that England could produce, and their fielding was excellent. The Lord's game was dominated by an innings of 205 not out by J. Hardstaff, and Alec V. Bedser of Surrey took 11 wickets in each of the first 2 tests. Merchant's 128 was the feature of the rain-ruined Oval match. Once again Yorkshire and Middlesex won first and second place in the championship; each side owed much to the leadership and cricket of their captains, Sellers and R. W. V. Robins. Hammond, Hutton, C. Washbrook and D. Compton were the great batsmen of the year, but the bowling was not up to prewar standards. At the end of the season an M.C.C. team under Hammond left to try to recover the "Ashes" from Australia. At the close of 1946, Australia had won the first two test matches, the first at Brisbane on Nov. 29-Dec. 4 by an innings and 332 runs, and the second at Sydney on Dec. 13-19 by an innings and 33 runs.

Test matches: England v. Australia English tour in Australia, 1936-37

First.-Brisbane, Dec. 4-9, 1936. England, 358 and 256; Aus-

tralia, 234 and 58.

Second.—Sydney, Dec. 18-23, 1936. England won by an innings and 22 runs. England, 426 for 6 wickets declared; Australia,

Third.—Melbourne, Jan. 1-6, 1937. Australia won by 365 runs. Australia, 200 for 9 wickets declared and 564; England, 76 for 9 declared and 323.

Fourth.-Adelaide, Jan. 29-Feb. 3, 1937. Australia won by 148

runs. Australia, 288 and 433; England, 330 and 243.
Fifth.—Melbourne, Feb. 26-March 3, 1937. Australia won by an innings and 200 runs. Australia, 604; England, 239 and 165.

First.-Trent Budge, June 9-14. Drawn. England 658 for 8 wickets declared, and did not bat; Australia, 411 and 427 for 6 wickets declared.

Second.—Lord's, June 24-28. Drawn. England, 494 and 242 for 8 wickets declared; Australia, 422 and 204 for 6 wickets. Third.-Old Trafford, July 8-12. No play, rain.

Fourth.—Leeds, July 22-25. Australia won by 5 wickets. England, 223 and 123; Australia, 242 and 107 for 5 wickets. Fifth.—Oval, Aug. 20-24. England won by innings and 579 runs. England, 903 for 7 wickets declared; Australia, 201 and 123 (2 absent hurt each innings).

Crime

Crime in the United States showed several major changes in the decade 1937-46, and while postwar influences were fulfilling all forecasts as to their probable effect upon crime frequency, there was nothing to indicate that the country as a whole was headed for much higher levels of criminality. Absence of the problems incident to national prohibition, such as featured the previous postwar crime increase in the 1920s, contributed much towards a moderation of the crime frequency changes following World War II. There was, however, the usual rediscovery of juvenile delinquency as a great national problem, even though the means for determining the actual frequency of such crimes still were not available.

The best index of the number and type of criminal acts committed in the United States continued to be provided by the Uniform Crime Reports, collected and published by the Federal Bureau of Investigation in co-operation with the International Association of Chiefs of Police and more than 5,000 state and local police forces.

Among the 412 cities with more than 25,000 population, all but 2 were submitting regular returns by 1946 of "offenses known to the police," compiled by police agencies according to uniform rules and crime classifications. In 1937 there were 19 cities in this population bracket that did not participate. About 95% of the 666 cities and towns from 10,000 to 25,000 population also were filing such reports, as compared with 91% in 1937. The 1,533 smaller places reporting in 1937 increased to more than 2,000 in 1946.

Total population included in the crime reporting area was 73,000,000, as compared with 66,000,000 in 1937. Rural districts were still far less completely represented than urban areas. Nevertheless, the samples for rural areas were sufficiently numerous and representative to permit general measurements of trends in rural crime, while the reporting area for urban places was so nearly complete that only the abiding defects of all social statistics served to qualify the meaning of the crime reports received from them.

But however substantial the bases for recording the number of crimes committed, the means still were not at hand for computing or even roughly estimating the amount of juvenile crime and delinquency. Reasons for this condition arose from the fact that only detected crimes could be identified as of juvenile origin. Reports on the extent of delinquency therefore rested entirely upon the number of cases in which juveniles were prosecuted; and this of course varied with law enforcement and other policies, sometimes without regard for the actual amount of juvenile participation in crime occurrences.

Hence in appraising the crime developments of the decade it is of primary importance to distinguish between the data derived from reports of "offenses known to the police," and those stemming from the number of persons arrested, charged or fingerprinted.

Changes in Crime and Criminality, 1937–46.—The 1937–46 decade was marked by some highly varied shifts in the amount of certain crimes in urban areas. In general the trend from 1936 through 1944 was downward. This was especially pronounced in robbery and auto theft, with negligent manslaughter (chiefly in the operation of motor vehicles) and murders also showing some decline. But burglaries and larcenies edged up slightly, aggravated assaults (i.e., with a deadly instrument) were almost one-third higher and rape showed an increase of 75%.

The end of World War II brought an immediate change in the crime situation, with all categories of reportable offenses showing more or less marked increases during 1945 and 1946. Some of the largest increases occurred with respect to types of crimes that had been most sharply declining during the major part of the decade. Thus robbery and auto theft, which had led all the rest in the retreat from higher levels from 1937 to 1944, now showed the highest percentage of increase. In 1945 alone, the upturn for robbery was 23.6%, and for auto theft 18.7%. But burglaries, which had changed direction easily during the fore part of the decade, with a very slight upward tendency, now rose by 17% in a single year. Negligent manslaughters were not far behind (16.2%) and were followed by murders (10.1%), aggravated assaults (8.7%) and larcenies (8.6%). Rape, which had shown the largest and most consistent increase from 1937 to 1944, now significantly had the smallest gain-only 5.7%.

Thus the general effect during the immediate postwar period was one of return to earlier crime levels and earlier crime trends. In reviewing such criminal data one cannot avoid the conclusion that during the war years and war's aftermath crime frequency was largely controlled by the presence or absence of those age groups tending to commit a disproportionate share of criminal acts, and which also were inducted into the military service in the largest numbers. As these youthful components of the general population were moved out of the United States and into the theatres of war, most categories of crimes tended to decline. When redeployment changed the direction of such shifts, the crime index rose with amazing fidelity.

Rural increases in crimes generally were accomplished at a slower rate than in the cities, although the relatively infrequent crimes of murder, rape, aggravated assault and robbery actually rose more rapidly in rural areas than in urban.

Shifts in the rates for rural crimes are summarized in Table I. The total population of the reporting areas therein represented varies with each year between 30,000.000 and 35,000,000 inhabitants.

Table 1.—Rural Crimes: Rates per 100,000 Inhabitants, 1943-45 Inclusive

	1943	1944	1945
Murder and non-negligent manslaughter	4.11	3.96	4.49
Manslaughter by negligence	2.99	3.01	3.46
Rape	8.82	8.69	9.73
Robbery	11.50	11.60	14.80
Aggravated assault	22.80	22.70	26.40
Burglary	91.40	94.80	107.60
Larceny	151.50	155.40	156.30
Auto theft	44.10	52.50	59.50

As in the case of the cities, these figures show mixed relationships for the years 1943-44, but with the close of the war in 1945 the upswing of reported crimes in rural areas was too positive to be missed.

The net effect of these various shifts was that the general crime level in 1945, for urban and rural areas combined, was only about 12% higher than in 1937. While there was some evidence of a further upward tendency in prospect before the full effects of postwar factors were registered, there was nothing to indicate that the nation was

confronted with a new criminal era of unexplained ferocity.

Stated in raw figures, the estimated grand total of all reportable offenses included in the nation-wide crime reporting system was 1,565,541 in 1945, or an average of 1 such offense in each 20 seconds. Included in this total, however, were many crimes of slight magnitude, and others which had been thwarted in their commission and therefore constituted attempts at crime, rather than completed offenses. That every 61/2 minutes someone was raped, or assaulted with a deadly instrument or slain was a more challenging and a more startling description of conditions. On the other hand, the estimated daily toll of 662 stolen cars was slight indeed when compared with the tens of millions of such vehicles left unattended day and night on city streets and rural highways. In fact, national levels for auto thefts were only six or seven times greater than the number of such crimes in Chicago alone in the early 1930s. Hence if some ground had been lost by crime control at the war's end, the line had not given way everywhere by any means, and there were some points at which substantial gains were discernible.

The mixed character of crime trends during the 1937-45 period is shown in simplified form in Table II, wherein

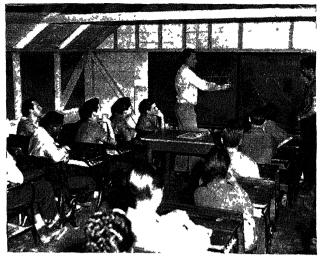

Table II.—Estimated Total Number of Reportable Offenses in the United States: 1937, 1941, 1945

	1 <i>937</i>	1941	1945
Murder and non-negligent manslaughter	7,859	7,562	6,847
Manslaughter by negligence	5,705	4,582	4,387
Rape	8,518	9,257	11,537
Robbery	59,786	49,832	54,279
Aggravated assault	45,478	48,385	59,807
Burglary	292,870	302,475	321,672
Larceny	780,031	919,120	865,521
Auto theft	215,569	190,059	241,491
Totals	1.415.816	1.531.272	1,565,541

it will be noted that while most of the offenses had reached fairly high levels in the 1945 upsurge, the murder and manslaughter curves were still tending definitely downward, while the total of robberies, which rose sharply in 1945, still did not reach, or even closely approach, the 1937 level for this crime. In short, the big bulge in the grand total of reportable offenses was caused by a marked rise in burglaries and auto thefts, particularly the latter. There was a high probability that many of the crimes against property were motivated by the relative scarcity of many articles during and immediately following World War II. The great and sudden rise of auto theft in 1945, which quite closely coincided with the removal of gasoline rationing, seemed to be especially significant.

Certainly there was no evidence of personal hardship or dire economic need, as a major contributing factor in this postwar upswing. On the contrary, the available data were such as to lead to the conclusion that personal indulgence was of far greater importance in crime motivation during the postwar period. While the moralist might condemn such influences, the long-range observer of criminal trends, reconciled to the inevitability of crime under any and all conditions, was heartened by the thought that when the industrial machine again produced luxury goods in large quantities, the urge to secure them through theft rather than purchase would be materially weakened.

In one respect, however, there was substantial increase not likely to be followed soon by a recession. It consisted in the fact that the average dollar loss for crimes against property rose steadily throughout the ten-year period. Contrasts shown in Table III reflect not only increased dollar values of certain stolen articles (as for example motor cars), but also the greater amount of money and other wealth

Delinquent boys attending class at an experimental mountain camp sponsored by the city of Los Angeles. The boys studied forestry and governed their own community under the guidance of trained psychologists

that was open to attack under an inflated wartime economy than was available during the prewar depression years.

Table III.—Average Dollar Value of Property Stolen; by Type of Crime; 1937, 1945

																								1937	1945
Robbery .																									\$146
Burglary .	•	•	•	•	•	٠	•	٠	٠	٠	٠	•	٠	٠	٠	٠	٠	•	٠	•	٠	٠		59	118
Larceny .	٠	•	•	٠	٠	•	٠	•	٠	•	٠	٠	٠	٠	•	٠	٠	٠	٠	•	٠	٠	٠	29	.54
Auto theft	٠	•	•	٠	٠	٠	٠	٠	٠	٠	•	٠	٠	٠	٠	٠	٠	٠	٠	٠	٠	٠	•	3,33	605

Total 1945 losses caused by property offenses averaged about \$1.81 per capita in cities of more than 25,000 population; in 1937 the average was only \$1.15 per capita, though here again the effects of monetary inflation must be held partly responsible for the rise. Recoveries in 1937 averaged 64.6%. By 1944 they had risen to 71.3% and in 1945 totalled 68.8%. Net losses were substantially reduced thereby.

The loss-burden falling upon various types of property is shown in Table IV. These percentage distributions showed little change from year to year during the decade. The heavy preponderance of losses for stolen cars is readily understood, but the relative importance of the "miscellaneous" category requires a word of explanation. In general it includes such high value articles as typewriters, business machines, firearms, automobile accessories, tools, machinery, furniture and fittings, plumbing, liquor and tobacco.

Further analysis of robberies, burglaries and general larcenies committed in U.S. cities tended to emphasize the fact that these crimes were rather heterogeneous in their nature, even though their definition by statute might be in a long-established common terminology. Thus Table V shows how certain types of these crimes fluctuated during the critical war years, and particularly how some rose sharply despite a general downward trend (for example, bank robberies and major larcenies) while others fell when the general trend was upward (as in the case of bicycle thefts). Notable, too, was the rapid change in the direction

of certain of these crime trends. Some appeared to be closely related to wartime changes in the U.S. scene itself. Thus the extraordinary drop in the number of oil station robberies in 1942 and 1943 was perhaps related to the reduction in the number of such business ventures caused by gasoline rationing, thereby reducing the number of robbery exposures. After two almost vertical declines in the early war years, robberies of the special type remained at a low level in 1944, and then rose to a point close to the old levels when gasoline rationing was discontinued in 1945.

Table V.—Annual Percentage Change in Frequency of Certain Offenses Classified by Time and Place and Other Characteristics; 1942–45

	1942	1943	1944	1945

Similar rapid changes in the number of bank robberies were partly due to the small number of such crimes, with consequent wide swings in percentage of rise or fall.

Of all persons arrested and fingerprinted during 1945, 57% were taken into custody outside the state of their birth. While this stood in striking contrast with the 42.5% similarly recorded for 1937, it may fairly be questioned whether the increase was anything more than a reflection of the wide dispersion of war workers and their families which reached a climax in 1945. It seemed to be a reasonable assumption that home ties made for law observance, and their severance for law infractions, but only specific rates could establish the relationship. Since the difficulties inherent in securing the data for such rates were probably insurmountable, the question promised to remain unanswered.

The proportion of persons arrested and fingerprinted, who were found to have a record of previous arrest or conviction, also increased notably during the decade. In 1937 those with previous criminal records constituted only 42.4% of the total whereas 51.9% were so classified in 1945. Here again, however, extreme caution had to be exercised in drawing conclusions that recidivism was increasing. If such comparisons held any validity, then the increase was very great indeed during the 25 years following World War I; because the early 1920s saw scarcely more than 25% of such identifications. The very strong probability, however, was that there had been no large net increase in recidivism, and perhaps none at all, with the striking changes marked by the foregoing figures representing merely the vast improvement in identification resources

particularly through the formal establishment of a nation-wide clearinghouse for identification records in the Federal Bureau of Investigation in 1930. This great national facility by 1946 had expanded to a point where it included the criminal record of all, or nearly all, the criminal characters passing through the official channels of police, prosecutors, courts, jailers, prison wardens and probation and parole authorities. Hence there was reason to believe that the net rise in the proportion of previous criminal records merely reflected the vast improvement in identification reporting. Measured by such standards, the specific rate for recidivism was two-thirds more common among males than among females.

Arrests of males under 21 years of age were 7.3% less numerous in 1945 than in the prewar year 1941; but if specific rates were applied to those in this youthful age bracket who were actually within the United States in these two respective years, it would be found that the arrest rate for young males was much higher in 1945. Of female offenders during these war years, it may be said that even the crude totals of arrests showed an increase of almost 110%—a fact that would surprise no one who had followed the activities of "victory girls" and their ilk. Still there were, even for such as these, certain firm indexes of a return to more normal levels, particularly in the fact that in the last of the war years female arrests decreased for all ages up to and through 20 years. In short, female delinquencies were beginning to recede at their source.

The end of the decade found the United States taking stock of its crimes and criminals and seeking to determine the extent and significance of both.

It appeared that for the country as a whole, the 8 reportable offenses listed above exceeded 1,500,000 per annum. The most numerous single crime category was larceny, which accounted for more than one-half of the total. About 95% of all reportable offenses were committed against property (larceny, burglary, auto theft and robbery) while the four reportable crimes against the person (murder, manslaughter, aggravated assault and rape) provided the total of the rather modest remainder.

Among geographic divisions, the greatest and smallest postwar increases were as shown in Table VI.

Table VI.—Postwar Changes in Geographic Distribution of Crime

Offenses	Greatest Increase	Greatest Decrease or Smallest Increase
	Mountain +26.1%	New England -5.3%
Manslaughter by negligence Rape Robbery Aggravated assault .	Pacific +42.7% Mountain +27.1% West North Central +54.2% New England +28.9%	South Atlantic -4.5% West North Central -6.3% South Atlantic +9.0% West South Central +1.8%
Burglary; breaking or entering Larceny Auto theft	West South Central +24.6% West South Central +13.7% West North Central +30.1%	South Atlantic +12.3% South Atlantic +1.0% South Atlantic +8.9%

Of possible significance was the fact that the areas west of the Mississippi, which had seen some extraordinary population increases during war industry migration, also showed the largest increases in most crime categories. On the other hand, the South Atlantic states, from which large numbers of Negroes had been attracted by the high wages paid by war industries of the north and west, enjoyed a prominent place in reducing the amount of crime or moderating its postwar increase.

Up to a point shortly before World War II, the number of crimes in relation to population generally varied directly with the size of cities. In other words, the largest cities not only had the most crimes, but the highest crime rates, and this relationship held right down through the various population groups of cities. With the dislocations

of war, however, one major change occurred. Cities of more than 250,000 lost first place in all crime rates except rape and robbery, while cities from 100,000 to 250,000 population showed the highest rates for murder and manslaughter, aggravated assault, burglary, larceny and auto theft. The new relationship held with such amazing consistency during the four war years 1942-45 inclusive, as to raise a question whether the change might have been warconnected. One possibility was that the shift of population induced by the rise of war industries more greatly affected cities of the second magnitude, thus not only producing a certain amount of distortion in the crime rates, but also actually burdening such second class centres with a disproportionately large floating population. As elsewhere noted, the latter seemed more predisposed to criminal acts than the more static population groups.

Other relationships between certain classes of the population and the amount of crime were indicated by the age distributions among persons arrested and fingerprinted. In 1945, for example, arrests of males under 21 years of age were 7.3% less than in 1941, the last prewar year. During this same four-year period, however, arrests of females in the same age group more than doubled. Also apparent was a shift in the peak age for arrests in the three years 1937–39. The ages at which the maximum number of persons were arrested were 22, 21 and 19 years respectively, whereas in 1944 the peak ages were 17 and 18 years, and in 1945 age 17 had moved to a lead of about 5% over age 18.

Wider age brackets reflected similar changes. In 1937, 18% of all males and females arrested were under 21 years of age. By 1945, this group constituted 21% of the total. On the other hand, the age group 21–29 constituted 33.6% of all arrests in 1937, whereas by 1945 it had fallen to 28.4%. Since the absent generation in the military service was largely drawn from this age group, the decline recorded at the end of the period was not at all surprising.

A big feature, of course, was the marked rise in arrests of females under 21 years of age. Drunkenness was the most numerous of the charges brought against females, with sex offenses, vagrancy, disorderly conduct and auto theft following in that order. Together these offenses constituted about two-thirds of the total, and it will be noted that the active criminal element was either absent or a secondary consideration as to all of them.

Considerable emphasis was placed upon these shifts by both skilled and unskilled observers of the criminal scene in the United States, and some gloomy conclusions were drawn as to their meaning. For with the peak age of criminal activity at such youthful levels it was argued that the future of the U.S. commonwealth was indeed clouded. Such dark forebodings would probably not be realized, however, since many of the offenses entering into such tabulations were of a kind long associated with youth and its excesses, while an increasing public anxiety for the rising generation tended to increase the number of arrests for these typically juvenile offenses.

Moreover, there were already evidences in 1946 that with the passing of the extraordinary freedoms and fancies of the war years arrests of females in the age bracket from 18 to 22 were about to reverse the upward trend of the years 1937–45.

Still it would be folly to ignore the possible significance of such comparisons as the following: 35.6% of all persons arrested in 1945 were less than 25 years of age; but these young persons constituted 58.6% of those charged

with robbery, 65.4% of those charged with burglary, 49.6% of those charged with larceny and 80.3% of those charged with auto theft. The net result was that about one-third of the persons arrested constituted over one-half of those charged with the foregoing crimes against property. The ratio for each of these offenses was slightly higher in 1945 than in 1937, and in this special sense there was therefore more youthful crime at the end of the period than at its beginning. To conclude, however, that the increase, while modest, was also permanent, was to commit the same logical errors repeated by each succeeding generation. The plain fact was that youths are more prone to certain crimes than are oldsters. But youthful crime rates, while they occasionally rise, also recede. In the backwash of world conflict, social disorganization and currency inflation, youth's offenses bulked larger than usual, but with a return to more normal social and economic conditions a decline in youthful crime and delinquency was confidently anticipated.

The social and economic status of the Negro changed so greatly during the decade that comparative arrest data concerning the white and Negro races held special interest. In 1937, 383,306 whites were arrested and fingerprinted. In 1945, this figure had risen to 390,315. On the other hand, 100,662 Negroes were arrested and fingerprinted in 1937, and 145,571 in 1945. This contrast, great as it was, became even more striking when arrests among the two races were presented as specific rates. Thus, of each 100,000 Negroes over 15 years of age, 1,412 were arrested and fingerprinted in 1937. The corresponding rate for whites was 495. By 1945 the ratio for arrested Negroes had risen to 1,613, whereas that for whites remained unchanged.

Foreign-born whites, on the other hand, continued to show a low ratio of arrests, at a level less than half that for native whites, and even improved their relative position somewhat as the war period approached. Reliable and comparable data relating to crime and criminality among native whites of foreign parentage were not available, though special studies showed that their specific rates were inordinately high. For the purposes of these comparisons the native sons and daughters of the foreign-born were included with other native whites, thereby unfavourably affecting the crime record of the latter as a class.

The conclusions drawn from these major changes varied greatly. To some, the 14.3% increase in the specific rate of Negro arrests during the 1937–45 period was evidence of continuing social injustices; others contended that the Negro was abusing his new freedoms, while still others, with an eye on the migration from remote sections of the deep south to the teeming industrial centres of the north and west, sought to explain the higher arrest rates in terms of such displacements and readjustments. Whatever the true explanation might be, there could be no avoiding the importance of this development, and the postwar trend of Negro arrest rates was anxiously examined for the light it might throw upon an abiding problem.

Significant of the changes occurring between 1937 and 1945 was the relative frequency with which persons charged with various crimes were identified as having previous criminal records. Narcotic drug addicts consistently led all the rest in degree of such recidivism, but there were major changes as to certain other crimes. Especially notable were persons charged with drunkenness. In 1937 this group held 6th place with 46.4% of recidivism; by 1945 they had risen to 2nd place with 63.2%.

Similarly, violators of liquor laws moved from 14th place (38.8%) in 1937 to 8th place in 1945 (51.4%), while gamblers rose from 21st place in 1937 (27.6%) to 11th place in 1945 (48.7%). Not merely the rate of recidivism but the number of persons charged with gambling almost doubled during this period. Thus were the social and economic effects of transition from peacetime depression to wartime boom reflected not only in large increases in numbers of arrests for drunkenness, liquor law violations and gambling, but the proportion of repeaters in these "easy-money" offenses also increased.

On the other hand, two types of offenders showed marked declines in frequency with which previous records were identified. In 1937, persons charged with prostitution and commercialized vice were the 5th most frequent in point of recidivism (49.0%); by 1945 this category had dropped to 21st place (42.4%). Since the number of persons arrested for this offense had meantime doubled, it appeared that wartime observations on the non-professional sex delinquencies of "victory girls" were well established in fact. The sometimes related charge of vagrancy not only declined markedly in numbers (by about 30%) but also showed a very slight decline in degree of recidivism. In the latter respect it held 2nd place in 1937 (58.2%) but had dropped to 6th place by 1945 (56.9%).

Crime in Britain.—In 1936, Great Britain was congratulating itself that crime among the higher age groups was declining and that its future control of lawlessness rested on its attaining a solution of the problem of the young lawbreaker. At that time there were about 100 murders each year. From a quarter to a half of the murderers committed suicide. Police efficiency was such that there were arrests in all the other cases except three or four a year, and it was usually patent that the police suspected the criminal in these instances but were unable to secure enough evidence to charge. The murderer was not, therefore, a police problem, though he reflected a social problem more vividly, expressed by the growth of the number of suicides to 5,223 in 1935.

The proportion of criminals in 1936 was represented by 370 out of every 100,000 men and boys being found guilty of some crime, big or little. The incidence among females was only an eighth of this. Of all indictable cases, almost three-quarters were stealing in one form and another. "Smash-and-grab" raids on shops were the most disturbing of those crimes that came to instant public notice. There were also widespread thefts of bicycles, cars and from automatic machines and meters. Though modern houses with many windows and low elevation gave easy chances to burglars, there was little increase in either burglary or housebreaking.

Police authorities speeded up the mobility of police largely in response to the increase in traffic offenses. It became a byword to point out that the police were not so much engaged in tracking down criminals as in keeping citizens in order. The police, however, introduced radio cars to catch the real criminals and sought the close cooperation of the public through the telephone. To "dial 999"—the call in London for Scotland Yard—was a popular innovation. The calls grew to 5,000 a month in London in 1945.

Before World War II the metropolitan police established the police college at Hendon in order to train officers for the force and to increase its administrative efficiency. It ran for five years before the war interrupted its work, and supplied higher officers to many British police forces. In 1938 the government, aware of the inadequacy of past legislation for dealing with the habitual criminal, introduced a comprehensive Criminal Justice bill which proposed to abolish imprisonment for young offenders, to abolish flogging as a punishment except for serious offenses in prison and to set up compulsory public hostels for the corrective training of young people, but the war did not allow this bill to go beyond its second reading.

The war also interrupted the yearly publication of the official Criminal Statistics for England and Wales. During the war itself, Britain was surprisingly law-abiding. By 1940, the prison population had fallen from 13,000 before the war to 5,000. By 1943, crime had reached its lowest rate in modern experience in Britain. In that year the number of robberies with violence during the blackout in the West End area of London was only 35.

Though rationing gave rise to black market (q.v.) operations, there was scarcely any highly-organized black market crime.

The turn came in the autumn of 1945; when the semblance of a "crime wave" occurred. It was variously attributed to deserters from the forces, the black market, a general lapsing into lawlessness at the end of the war and a shortage of trained police. The crime statistics of 1945, compared with 1939, showed a considerable increase in serious crime: penal servitude sentences were 541 in 1939, 741 in 1945; higher court sentences to imprisonment apart from penal servitude were 3,486 in 1939, 6,397 in 1945. In London during the first 9 months of 1945 there were 12,000 serious and petty crimes and for the same period of 1946, 11,000. (The comparative level before 1939 was 9,000.)

There were several big jewel robberies in 1945 and 1946, and particular mention must be made of the theft of the duchess of Windsor's jewels. In Oct. 1946 Ednam Lodge, Sunningdale, where the duke and duchess were staying during a short visit to Britain, was entered, and jewellery valued at between £20,000 and £25,000 was stolen from the duchess's boudoir.

The intruder escaped the eyes of special detectives and apparently entered by climbing a rainpipe to an open window.

The end of the war saw a fresh impetus among penal reformers for a firmer attempt to deal with the habitual criminal and the juvenile delinquent on medical and psychiatric lines. Psychiatry played little part in Britain's handling of its criminal problem and there was an absence of scientific data. It was recognized, however, that juvenile delinquency was the root problem, that police with high mobility could catch the criminal, and that considerable changes in the court treatment of him should be introduced in order to permit psychiatric examination of prisoners prior to reformative imprisonment. Cripps, Sir (Richard) Stafford

Sir Stafford Cripps (1889—), British statesman and lawyer, was born April 24, 1889, the youngest son of Charles, 1st Baron of Parmoor. He was educated at Winchester and University college, London, and was called to the bar in 1913. He was appointed solicitor general in Ramsay Macdonald's government in 1930 and the following year he entered parliament as Labourite member for East Bristol. He resigned when the national government was formed in 1931 and became one of the opposition leaders.

In June 1940, Churchill named him ambassador to Moscow-Sir Stafford had long advocated British-Soviet rapprochement. Recalled from Moscow in Jan. 1942, he became lord privy seal in the Churchill cabinet the following month. In March he was sent to India with the British "freedom proposals," which Congress party leaders rejected as inadequate; Sir Stafford, on the other hand, held the Congress chiefs responsible for the breakdown of negotiations. In Nov. 1942, he was named minister for aircraft production. Following the Labour party victory in the national elections in the summer of 1945, he was appointed president of the Board of Trade, and on Feb. 19, 1946, Prime Minister Attlee named him to a three-man mission to New Delhi to discuss measures for granting India self-government. After three months of negotiations, during which Hindu, Moslem and British government leaders failed to reach substantial agreement, the mission announced suspension of negotiations for an interim government, on June 26, 1946.

Crowley, Leo Thomas

Crowley (1890?-), U.S. government official, was born in Milton Junction, Wis. Educated at the University of Wisconsin, Madison, Wis., he worked as a salesman for a paper company at the age of 20, becoming president of the organization at 23. He was regional administrator for the Farm Credit administration at St. Paul, Minn., and was chairman of the Federal Deposit Insurance corporation in Washington, D.C., 1934-39. Although he wanted to leave to assume an executive post with a utilities firm, he heeded Pres. Roosevelt's request to continue with the FDIC, again becoming chairman in 1942. In March of that year he also became Alien Property Custodian. After Pres. Roosevelt removed Jesse Jones and Henry Wallace from control of agencies dealing with foreign economic operations, he created in 1943 a new super-agency, the Office of Economic Warfare, and appointed Crowley administrator of this department in Sept. 1943. Because of the press of his other work, Crowley resigned March 24, 1944, as alien property custodian.

Crowley disclosed on May 12, 1945, that lend-lease to the soviet union had been suspended with the end of the war in Europe, but six weeks later (June 25), he revealed that the government had decided to continue lend-lease aid on a reduced scale to supply soviet forces in the far east. On

Sept. 27, 1945, Pres. Truman accepted Crowley's resignation as chairman of the FDIC and the FEA; the president also abolished the latter agency.

Cryolite

Although small amounts of cryolite are used in glass, enamels, abrasives and insecticides, its chief use is in the electrolytic bath for the reduction of aluminum. Ivigtut, in Greenland, remained the only source of the natural mineral; synthetic cryolite had been made on a limited scale in Europe for a number of years, but it was not until World War II threatened a possible restriction of the natural mineral that the synthetic substitute received much attention in the United States. Three plants were built for the production of artificial cryolite, but as an adequate supply of natural cryolite was maintained, only one plant was operated.

Prewar imports averaging 15,000 tons a year, including possibly 10% to 15% of synthetic cryolite, were expanded by war demand for aluminum to a peak of 72,312 tons in 1942, declining to 17,562 tons in 1944 and recovering to 20,106 tons in 1945.

Cryolite was put under complete allocation and use control by the War Production board in Sept. 1942, but adequate supplies and stocks, coupled with a heavy reduction in aluminum output, permitted the removal of all restrictions in Oct. 1944.

Csáky, Stephen

Count Csáky (1897-1941), Hungarian statesman and diplomat, was born in Segesvar, Hungary, and spent nearly half his life in the Hungarian foreign service. He embarked upon a diplomatic career in 1921, when he was appointed secretary at the Hungarian embassy in Rome. Three years later he was transferred to the Bucharest embassy, and subsequently was chargé d'affaires at Madrid and Lisbon. In 1934 he was appointed minister to Spain, and in 1938 he became foreign minister of Hungary. Csáky, an ardent revisionist, sought the return of territories wrested from Hungary after World War I, and shaped his foreign policy to that end. Convinced that the axis powers were destined to dominate Europe, he voiced vigorous approval of their policies and in return was rewarded in Aug. 1940, when Germany and Italy compelled Rumania to cede half of Transylvania to Hungary. In Nov. 1940 he signed the Rome-Berlin-Tokyo pact and shortly before his death he concluded a treaty of "perpetual friendship" with Yugoslavia. He died in Budapest, Jan. 27, 1941.

Cuba

A West Indian republic, Cuba includes the island of the same name, the Isle of Pines, and other minor islands and keys. The total area was variously stated by authorities to be 44,164 and 44,218 sq.mi.; the official Cuban census of 1943 stated that the exact extent was not known. The main island of Cuba is the largest of the four islands comprising the Greater Antilles. Pop. (1943 census), 4,778,-583. Population density for the whole republic, by the 1943 census, was 108.07 per sq.mi. The population was officially estimated in 1944 to include 75% white (of which approximately one-third was mulatto), 24% Negro and 1% Mongoloid (mostly Chinese). The capital and chief port is Havana (officially, Habana) with a pop. (1943 census) of 676,376 (including rural municipios). Greater Havana includes about 800,000 people and represents a cosmopolitan mélange including Spaniards, West Indians, Central Americans and Chinese. Other important cities (with 1943 census pop. unless otherwise indicated) are Santiago de Cuba (1946 est., 152,000), Marianao (a Havana suburb, 120,163), Camagüey (1946 est., 87,009), Matanzas (54,844), Cienfuegos (52,910), Guantánamo (site of a U.S. naval base, 42,423), Cárdenas (37,059), Holguín (35,-865), Manzanillo (36,295), Ciego de Avila (29,130), Santa Clara (27,925), Pinar del Río (1946 est., 63,461), Regla (23,037), Güines (22,669), Guanabacoa (30,287), and Placetas (19,693).

Presidents during the decade 1937–46 were Dr. Federico Laredo Bru (1936–Oct. 10, 1940); Maj. Gen. Fulgencio Batista y Zaldivar (Oct. 10, 1940–Oct. 10, 1944); Dr. Ramón Grau San Martín, after Oct. 10, 1944.

The Power of Col. Batista.—The tempo of Cuban political life levelled off considerably beginning with 1937, after a very disturbed period dating from the ousting of Pres. Gerardo Machado in Aug. 1933. Between that event and the beginning of 1937, several presidents had been in power for short periods, practically all of them at the sufferance of Col. Fulgencio Batista, chief of the constitutional army and leader of the so-called "sergeants' revolt" in Sept. 1933. The latest of these presidents had been Mariano Miguel Gómez, the first elected president in several years, who held office only from May to Dec. 1936; when he refused to approve a Batista-inspired law which placed rural education under control of the army he was impeached, at Batista's virtual direction, and removed from office. The vice-president, Dr. Federico Laredo Bru, then assumed office and completed the term, proving amenable and acceptable to Col. Batista. The year 1937 was thus featured by more open military domination of the government, after the attempt at civilian supremacy under Gómez. The year was also characterized by increased sentiment against foreign business and an extensive and ambitious "three-year plan" for the nationalization of industry. The first months of 1937 saw the elimination of Gómez partisans from official positions, with important changes in the presidency of the chamber of representatives and in the diplomatic representation at Washington.

The government made continued efforts to improve the status of labour and industry at the expense of foreign enterprise. A previous law had required that a minimum of 50% of the pay roll in each establishment must go to Cuban nationals. The congress in May 1937 enacted legislation raising the minimum to 60% in spite of bitter protests by foreign concerns that the new law made it difficult to obtain adequately trained highly technical personnel. U.S. business firms also levied sharp criticism against the Cuban government because of the signing of a

commercial treaty with Great Britain on Feb. 19, by the terms of which British nationals were granted special exemptions from labour laws and most-favoured-nation status, except as against the United States. Cuba, by the terms of the treaty, gained most-favoured-nation status in British markets, except as against the British Empire. The Cuban government further reflected a nationalistic labour policy by the deportation, in February and March, of several thousand Haitian, Jamaican and other West Indian labourers. The Cuban national credit was greatly enhanced by a decision of the supreme court on June 2 upholding the validity of \$60,000,000 in loans made by the regime of Gen. Gerardo Machado prior to his ousting in 1933. The loans had been contracted primarily for the financing of the great Central highway and the \$18,000,000 national capitol, and had been placed chiefly in the United States. After the ousting of Machado, the issues had been repudiated on the grounds of unconstitutionality, but the supreme court held them to be legal obligations. Financial interests and the Cuban government tentatively agreed on a plan in Dec. 1937 for the issuance of new bonds to replace the old ones.

Col. Batista in July 1937 announced an ambitious program of social and economic reorganization, the so-called three-year plan. This program embodied in one form or another most of the reforms that had been advocated after Cuba became independent 35 years before. With announcement of the plan, Batista and the army emerged openly as the main power in Cuba. The army, which Batista had enlarged considerably even above the increased size maintained by Pres. Machado, had previously obtained control of some schools, had built roads and hospitals and had intervened in congressional politics, especially in the case of the impeachment of Pres. Gómez; the three-year plan was a culmination of this varied activity. It included a 20-point legislative program designed to regiment almost every phase of national life. Among its proposals were governmental reorganization and regulation of the sugar and tobacco industries (the chief agricultural enterprises in the island), reform of banking and currency and of the tax system, increasingly nationalistic labour legislation, reforestation and development of water supply, distribution of state-owned lands, establishment of consumers' and marketing co-operatives, regulation of mining and oil production, reform of the judiciary, creation of a merchant marine, a vast health and education program and "nationalization" of property rights. The general public, in the opinion that the plan was too grandiose to be financed or executed by the government, was largely apathetic. Great confusion and bewilderment prevailed in business circles, however, upon announcement of the plan. The congress was plunged into turmoil, and within a few weeks the alarm felt by business interests had resulted in the shipment of more than \$30,000,000 abroad. In spite of the confused reaction, the government did, however, make considerable progress on certain phases of the plan before the end of 1937. A law enacted in August under government pressure attempted to introduce co-ordination of the vital sugar industry by granting sugar growers a fiveyear debt moratorium and providing for agricultural credits. When the congress reconvened on Nov. 1, 1937, after a six-weeks recess, Pres. Laredo Bru recommended rapid action on banking reorganization, and also suggested further tightening of labour legislation in order to give greater protection to the working classes. An act passed in December provided for distribution of state-owned lands to tenant farmers.

The problem of providing machinery for the elections

Fulgencio Batista (right) being sworn in as president of Cuba Oct. 10, 1940, at the presidential palace in Havana

of March 1938, for the renewal of half the seats in the chamber of representatives and for members of a proposed constituent assembly, was of perhaps greater concern to the congress than that of implementing the controversial three-year plan. Congress by Dec. 1937 passed an emergency electoral code in spite of vigorous opposition from minority groups in both houses. Another vexing problem before the congress was the question of amnesties for political prisoners and exiles. Students of the politically conscious University of Havana rioted in the senate chamber on Nov. 24 when the upper house adjourned without considering a political amnesty bill which the chamber of representatives had passed in a previous session. Former Pres. Machado was arrested in New York City in the meantime at the request of the Cuban government, which asked his extradition in order that he might be tried for the many crimes charged against him. While proceedings were pending against Machado in the United States, Col. Batista expressed himself as not opposed to a general amnesty; the senate hence took up the pending amnesty bill and passed it, with broadening amendments, on Dec. 20. The bill as finally approved was so sweeping as to embrace all political offenders, including some persons under the death sentence; it likewise covered many criminal offenses. In view of the broad terms of the act, the government dropped its charges against Machado, who had been in exile since 1933. When the act became effective on Christmas Day, 1937, 90 prisoners were released; additional releases followed.

Batista's political strength was manifested in the congressional elections on Mar. 4, 1938, in which 81 representatives and 1 senator were chosen. The 450 candidates nominated by 7 parties were all avowed supporters of Batista and the three-year plan, which had by that time become indelibly linked to him; opposing parties held aloof from the election. A brief cabinet crisis occurred in August, as a consequence of which all members of Laredo Bru's cabinet resigned so that new appointments might be made along ostensibly nonpolitical lines. On Feb. 4, 1938, Laredo Bru sent to the congress a recommendation for the liquidation of the Cuban public works obligations, which had been in default since 1933 along with other items of Machado indebtedness. The congress on Feb. 14 passed a bill authorizing an \$80,000,000 bond issue with

which to retire the outstanding public works bonds. The effort of the government to settle its defaulted and repudiated debts was a preliminary to the proposed establishment of its own bank of issue and an independent currency. The first distribution of government-owned lands to tenant farmers was made in March 1938, with 50 ac. allotted to each of 250 farmers. Those receiving the lands were required to occupy and cultivate them for at least six years. The farms could not be encumbered or sold, and were transferable only by inheritance. The exposure in March of an alleged conspiracy against the government indicated some popular unrest. Four men were killed when soldiers surprised a meeting of plotters; seven persons were later convicted of conspiracy and received prison sentences of three years each.

Upon the opening of the congress in April 1938, Col. Batista began actively to urge the adoption of laws called for by his three-year plan, but on May 4 he suddenly and unexpectedly announced the suspension of the muchpublicized plan until the long-agitated constituent assembly could be convened to provide the republic with a new constitution. He declared in his dramatic statement that he was sacrificing his plans for the social and economic reconstruction of Cuba in the face of the general demand from all parties for a free and sovereign constituent assembly. Observers considered that this sudden withdrawal of the three-year plan was a masterly political manoeuvre in that it threw all responsibility for the halting of the reforms on the shoulders of the political opposition. Another of the important events of 1938 was the launching of a \$6,000,000 public works program as a means of relieving unemployment, the funds to be obtained by a 10% reduction in government expenditures. The plan called for the repatriation of an estimated 50,000 West Indian labourers and the tightening of immigration laws, the adoption

Cubans demonstrating against the axis during the 1942 May day celebration in Havana

of wage regulation and further control of relations between employers and workers.

Laredo Bru, as a part of the administration's policy of cultivating the good will of the United States, signed on July 1 a congressional bill making July 4 a Cuban official holiday, to be celebrated as a demonstration of friendship for the United States. A further indication of a desire to collaborate with the United States came in Col. Batista's announcement in Nov. 1938 of willingness to co-operate in providing a haven for refugees from Germany; this development was a consequence of the Evian refugee conference some months earlier and the effort of the U.S. government to find homes for European displaced persons. Batista went to Washington in November, in the course of which trip, his first outside of Cuba, he joined Pres. Roosevelt in Armistice Day ceremonies at Arlington cemetery and later conferred with him at the White House. The attention Batista received in the United States brought him a revival of what had appeared to some observers to be a waning popularity in Cuba, caused by the island's economic distress. His popularity was further increased by the announcement made at Washington of the reduction of the U.S. tariff on sugar in consideration of an oral agreement on Cuba's part to throw open its markets to U.S. agricultural and manufactured goods, especially Louisiana rice. The U.S. Export-Import bank at the same time announced a loan of \$50,000,000 to Cuba to be used in advancing the country's public works program, especially projects of military and naval value to both countries.

Temporary Eclipse.—Batista's power and popularity underwent a temporary diminution in 1939 because of growing dissatisfaction with the policies of the regime, augmented by the badly depressed economic situation. The elections held Nov. 15 for the choice of members of the constituent assembly marked the worst defeat of Batista's political career. The government parties elected 35 of the 76 delegates, while the opposition elected 41. Batista gained prestige from one feature of the election, however, by winning general praise, even from his opponents, for the honesty and fairness with which the election was conducted. The status of the assembly from the legal standpoint was obscure. Government spokesmen insisted that it had power only to draft a new constitution, while the opposition claimed that it represented the sovereign will of the people and should be the supreme governmental as well as constituent power in the nation during the period of its functioning.

The imminent presidential election of 1940 was clarified in one respect early in Dec. 1939 when Col. Batista resigned his post as minister of war and formally announced his candidacy for the presidency; uncertainty had previously existed as to the part Batista would play in the election. Batista was nominated by six parties—the Liberal, Nationalist Union, National Democratic, Democratic Republican, National Revolutionary and Revolutionary Communist—which united for the purpose as the Social Democratic coalition.

Cuba established the first income tax in its history in a new tax law passed in 1939, which increased a number of other taxes. Charges of profiteering by raising the prices of prime necessities were filed against a number of Spanish, Chinese and Cuban merchants; in order to forestall any recurrence of such attempts, Laredo Bru signed a decree Sept. 9, setting maximum prices for certain essential foodstuffs.

Cuban developments in the field of foreign affairs were dominated in 1939 by the approaching and then the actual war. When the German steamship "St. Louis" arrived in Cuban waters in May and attempted to discharge 907 Iewish refugees from Germany, the vessel was refused permission to land its passengers on the ground that their papers were not in order. Laredo Bru ordered the ship to leave immediately, but fear of suicides among the despairing passengers caused the president subsequently to grant conditional permission to land the refugees on the Isle of Pines, where they might be kept in a temporary concentration camp. The reversal of decision came too late, however, as the ship had already begun the return trip to Germany, having found no other port at which it could discharge its passengers. Laredo Bru issued a proclamation upon the outbreak of the war in September declaring that Cuba would maintain strict neutrality. The government asserted itself favourable to any plan for the collective neutrality of the Western Hemisphere, and Cuba took a prominent part in the first inter-American foreign ministers' conference held at Panama in Sept.-Oct. 1939. The president later asked the congress to grant him special emergency powers to cope with the problems resulting from the outbreak of the war in Europe.

The constituent assembly formally opened its sessions on Feb. 9, 1940, under the presidency of Dr. Ramón Grau San Martín, provisional president of Cuba for five months in 1933-34. Under frequent charges of dilatoriness as the months passed, it proceeded to consideration of a draft constitution submitted to it. The document, embodying 318 articles and long transitory provisions, was officially adopted on June 8. The new constitution was drafted in great detail; it was some six or seven times the length of the U.S. constitution and was much the longest basic law of any Latin American state. (See below.)

Batista President.—The presidential election of 1940 developed into a clear-cut contest when opposition groups nominated Dr. Grau San Martín as their presidential candidate. The bloc supporting him included his own party, the Revolutionary Cuban (more widely known as the Auténticos), the A.B.C. and the Republican Action. The election was held July 14, 1940, and was accompanied by small but spectacular disorders. Col. Batista won easily, although charges of fraud were freely made, and formal investigation of alleged election irregularities was necessary before his election could be finally certified. Legal, battles over congressional and other election results were so common and complicated that the congress was unable to obtain a quorum on its constitutional date of assembly on Sept. 15. Some elections were not decided until late October. The new president was inaugurated Oct. 10. His greatest political problem was to give adequate recognition to the varied and seemingly irreconcilable groups which had supported him in the election. His cabinet, for this reason, included 14 members, 4 of them without portfolio. Difficult economic problems, especially financial, confronted Pres. Batista, because of the unbalance caused by World War II and by efforts to protect the national

An act of alleged "appeasement" took place ten days after the presidential elections. This was the legalization by the government of the Falange Española, a pro-fascist organization closely linked with Franco Spain. The Falange had been outlawed in Cuba during the Spanish Civil War in order to preclude disorders and controversy between its members and adherents of the Spanish republic; the problem of Falange activity was especially serious in Cuba because of the large numbers of Spaniards, representing both factions, present in the republic. The Falange was given legal recognition in Cuba after it had amended its internal organization to conform to constitu-

tional requirements. Such recognition aroused vigorous public disapproval, however. Another pro-axis group, the Cuban nazi party, was dissolved in September by order of the governor of Havana province. Cuban sympathies continued to be predominantly in favour of Great Britain in the struggle against Germany, and in Nov. 1940 it was formally advocated in the congress that a gift of 300,000 bags of sugar be made to British civilians. The Cuban government, under both Laredo Bru and Batista, gave virtually unqualified support to U.S. policy as regarded the war. The second Inter-American foreign ministers' conference was held at Havana in July 1940, following the fall of France. Its main topic of discussion, the "provisional administration" of European possessions in Middle America in the case that nazi Germany should attempt to assume possession of French, Dutch and perhaps British colonies, was of peculiar interest to Cuba because of the closeness of some of those possessions to its own territory. The Cuban government subsequently facilitated development of defenses. As in the United States, compulsory military service was authorized, and extensive increases in the air force were approved.

The first serious challenge to Batista's authority as president was successfully met early in 1941. Long-standing friction had existed between Batista and high-ranking military and police officers, especially Col. José Pedraza, chief of staff of the army, Col. Angel A. González, chief of staff of the navy, and Col. Bernardo García, Havana chief of police. Batista's discharge of García on Feb. 1 precipitated a crisis in which Pedraza virtually demanded Pres. Batista's resignation under threat of setting up a military dictatorship. Batista thereupon manoeuvred himself quickly and smoothly into full and direct control of the country's armed forces, arrested Pedraza, González and García, and, on Feb. 4, exiled them to Miami, Fla. He had in the meantime suspended constitutional guarantees for 15 days, but 2 days later, with the short-lived crisis virtually over, they were restored. Pres. Batista exploited this threat as proof that civilian authority must be supreme over the military.

A less spectacular but more serious threat to Batista's authority was the continuing congressional criticism and obstruction. The first clear-cut indication was the refusal by the congress to pass the 1941 budget, thus necessitating extension of the 1940 budget. The administration was also severely criticized in the congress for its alleged failure to take adequate measures against pro-fascist elements in Cuba. The Spanish consul general, Genaro Riestra, who had earlier been expelled from Mexico on charges of disseminating axis propaganda, was the centre of this controversy. Riestra was reputed to be the head of the Cuban branch of the Spanish Falange. He subsequently was declared persona non grata and was asked to leave the country, as was the Spanish commercial attaché. A local leader of the Falange, Francisco Alvarez García, as well as two other members, were taken into custody and charged with antidemocratic activities but were subsequently acquitted because of insufficient evidence. Popular sentiment in Cuba, following the lead of the United States, was strongly sympathetic with the Allies, and the government generally reacted in the same direction. Pres. Batista in Jan. 1941 issued a decree designed to curb totalitarian propaganda; the Falange on Feb. 13 was ordered to close its soup kitchens and welfare agencies; three days, later, all German and Italian consular officials were ordered to leave the country before Aug. 25. The bombing,

on Aug. 18, of several Spanish-owned shops, with serious injury to 12 persons, was a concrete indication of strong anti-fascist feeling.

Obstructionist tactics employed by opposition congressmen prevented consideration, before the end of the regular session of the congress on May 27, of a number of measures the administration deemed urgent. Batista therefore called a special session of the congress for July 14 to consider tax reforms made more important by the serious budget deficit and to authorize negotiation of a \$25,000,000 loan from the U.S. Export-Import bank. Batista in the meantime determined upon a reorganization and enlargement of his cabinet to try to offset congressional opposition resulting from patronage disputes. The new cabinet had 11 old and 7 new members, but its creation failed to quiet the opposition; a brawl on the senate floor on Aug. 4 involved some 20 persons. In spite of the continuing political crisis, however, the special session approved a general increase of 20% in all taxes before its adjournment. The next regular session, opening Sept. 17, voted to consider approval of the proposed Export-Import bank loan, and a law authorizing negotiations to that end received presidential approval on Nov. 21. Proceeds of the loan were allocated to highway construction and repair and to an agricultural program aimed at diversification and improvement of irrigation facilities.

The rising cost of living resulted in serious labour problems in 1941. The opening of the grinding season for sugar early in the year was endangered by a strike threat. Sugar planters desired a lower wage scale, but the labourers insisted that the scale established in 1940 should be extended. This first controversy was solved by Pres. Batista, who pegged wages at the previous level but provided for a downward scaling of wages should sugar prices decline. Strikes spread to other industries in Cuba, and 700 employees of wholesale food and liquor companies walked out in October when their demands for increased wages were refused. The entire problem of wages came to a head in November when labourers refused to work in the sugar mills unless they were granted wage increases. Batista again intervened, decreeing a blanket wage increase of from 10% to 25%.

Prompt War Declaration.—Cuban relations with the United States continued close throughout 1941. The two governments in November concluded a lend-lease agreement. Following the Japanese attack on Pearl Harbor, Cuba declared war on Japan on Dec. 9 and on Germany and Italy on Dec. 11.

Cuba's attitude toward Spain remained unfavourable, and the Spanish embassy was forbidden the use of code in its cable and radio messages because of the belief that this might facilitate axis activities. The government forbade all foodstuffs shipments to Spain and also the provisioning of Spanish ships in Cuban ports. Count Carlos de Bailen, a former Spanish representative to Panama who had been ousted from that republic because of pro-fascist utterances, was arrested in Cuba and later deported. A nazi spy was captured and sentenced to death in September. Cuba broke relations with the Vichy French government on Nov. 10, 1942, and by executive decree, froze French goods and funds. The U.S.S.R., however, was granted recognition on Oct. 11; Maxim Litvinov, Soviet ambassador to the United States, was later also accredited to Cuba. Batista in December made an official visit to Washington; conversations concerning the sale of Cuba's 1943 sugar crop, and priorities for irrigation and refrigeration machinery badly needed for Cuba's agricultural development, presumably formed an important part of his program there.

As part of Cuban co-operation in hemisphere defense, U.S. air forces were allowed the use of Cuban fields. The Cuban government in June 1942 began control of the movement of U.S. currency, difficult because so much circulated in Cuba. In September, Cuba and the United States signed a military agreement further integrating their war effort. Cuba signed a mutual defense pact with Mexico on Oct 3 by which joint use of facilities was pledged to combat axis submarines in the Caribbean and the Gulf of Mexico. Despite Cuba's active defense program, U.S. Ambassador Spruille Braden stated his belief that remote spots on Cuba's extensive coastline were being used as secret submarine bases. The Cuban army was greatly strengthened during the year, at first on a volunteer basis and later by compulsory military service; 400,000 Cubans between the ages of 18 and 50 began registration Aug. 1. The government increased defense appropriations and sent some air and naval officers to the United States for training. It established news and mail censorship in April, created a Cuban maritime commission in July, and ordered a census of all vessels more than 20 ft. in length in

No serious upheavals, meanwhile, occurred in Cuban domestic affairs. The congressional elections in March 1942 returned a comfortable majority for the administration's Democratic party. Pres. Batista undertook a reshuffling of his cabinet in June and in August; it remained largely Democratic, although somewhat wider representation was given to opposition parties in the constitution of the so-called "national unity" cabinet in August. One woman, Dr. María Gómez Carbonell, was appointed to the cabinet in June, the first woman to hold such a position. Opposition groups generally supported Pres. Batista's foreign policies but at times criticized his methods. Col. José Pedraza, exiled in Feb. 1941, was allowed to return in July.

An order dated Jan. 21, 1942, granted sweeping economic powers to the president. It gave him authority to regulate all mineral, agricultural and industrial production, control imports and exports, arbitrate labour disputes, fix prices and quotas and expropriate property of all kinds where necessary for the national defense. A shortage of circulating media existed early in 1942, and currency had to be imported from the United States. The government also made extensive loans for various purposes, and a special session of the congress in June considered the founding of a Cuban central bank to aid in fiscal operations. The serious shipping shortage affected Cuba severely, although air services provided by Pan American Airways increased during the year. Scarcities resulted in almost every aspect of Cuban life-in transportation, building materials and industrial supplies, consumer goods and foodstuffs; meat exportation was entirely stopped in April. The tourist trade, normally valued at \$12,000,000 annually, almost vanished. The government created various commissions to cope with economic problems, but it appeared during the summer that price stabilization and rationing were poorly enforced. Unemployment and rising costs of living caused much concern. Sugar plantation wages were raised 50% in the spring and government employees had theirs increased by 10% to 20%. A law passed in April forbade eviction of tenants from farms. The government also set a minimum price to protect tobacco growers. Cuban sugar was in great demand but was affected by lack of cargo space. The United States contracted to take

One of the reasons for the considerable concern felt in Cuba in the winter of 1942-43 over sugar prospects was the uncertainty as to whether the United States would await delivery of the 1,500,000 tons still held in Cuban warehouses before making payment. This doubt was removed by an agreement in Dec. 1942 by which Cuba was given 95% of the value of the unshipped sugar. Another problem was that not only would the United States have the stored sugar to draw on in 1943, but the same sugar would also substantially reduce available storage space. The two governments finally came to an agreement in Feb. 1943 to the effect that the United States was to absorb 2,700,000 short tons of the estimated 3,225,000 tons representing 1943 production; the amount taken by the United States was well under that of 1942. Improvement of shipping conditions early in 1943 made it seem likely, when Cuban representatives went to Washington for early negotiations over 1944 production, that most of the 1943 crop would be moved by the end of that year. An agreement in August pledged the United States to buy 4,000,000 short tons at 2.65 cents per lb., the figure for the previous years, although Cuba had desired a price increase because of higher wage levels and living costs. It was agreed, though, that a proportion of any price increase for sugar in the United States should be passed on to Cuba. Cuba had less success in trying to dispose of 100,000,000 gal. of molasses, as offered prices were lower than she was willing to accept, but it was expected by late in 1943 that most of the molasses could be converted into gin for new markets opened by the developing United States liquor shortage.

Cuban parties began preparations in 1943 for the presidential elections the following year. Batista, who was constitutionally ineligible anyway, announced early in the year that he would not be a candidate. The A.B.C. and Communist parties, formerly opposed to Batista, were given cabinet places in a reorganization in March. Some weakening of the government coalition developed in May when Vice-Pres. Gustavo Cuervo Rubio resigned to head a newly formed party. The leading presidential candidates appeared to be the Batista-favoured former prime minister, Carlos Saladrigas and Grau San Martín, Auténtico leader.

Diplomatic relations with Spain, somewhat strained in 1942, improved by midsummer of 1943 with agreement on a convention aimed at release of frozen credits dating back to the Spanish civil war and promising restoration of needed Cuban markets, especially for tobacco. Cuba concluded a new military and naval pact with the United States on Feb. 1 by which previous co-operation was strengthened. A treaty of amity with China was congressionally approved in January. Pres. Calderón Guardia of Costa Rica made a friendly official visit to Cuba in March. The new military training program began in 1943, and it was expected that 8,000 inductees would enter the army every 4 months. Shortage of officers led Batista early in 1943 to recall 48 former officers exiled since 1933. War conditions still affected Cuban economy in spite of bettered shipping. The government in July set price ceilings on various food items and on utility charges. In June it had created a board of economic warfare; a postwar planning group was established in August. A national food congress met in Havana in September, and Cubans interested in diversified agriculture continued to advocate erection of refrigerator warehouses and dehydration plants. The widespread shortage of fuels and of rubber and manufactured articles affected transportation and the volume of retail sales seriously.

Election of Grau San Martin.-The first five months of 1944 were occupied primarily with the crystallizing presidential campaign. Dr. Carlos Saladrigas y Zayas emerged as the favoured candidate, supported by a Socialist-Democratic coalition composed of the Liberal, Democratic, A.B.C., and Popular Socialist (formerly Communist) parties. Grau San Martín was supported by the Authentic-Republican alliance, including the Auténticos and the newly formed Republican party. Both coalitions endorsed the Cuban war policy, and the campaign hence revolved largely around personalities. The election on June 1 proved to be very orderly and free, in line with Batista's often repeated but frequently disbelieved promises. Grau San Martín was elected by a substantial majority, to the surprise of many observers in and outside Cuba. Rumours of a Saladrigas coup were current for a few days, but Batista soon declared his acceptance of the results and by that action and his conduct of the elections gained great prestige. Grau's followers won mayoralty contests in Havana and Marianao, but the Socialist-Democratic coalition carried most of the provincial and congressional elections. Grau visited both the United States and Mexico prior to his inauguration on Oct. 10, 1944; his reception by Pres. Roosevelt was very cordial, although pressure from the United States had helped force him out of the presidency in Jan. 1934. Grau, whose campaign had emphasized public honesty, made a sworn statement of his personal fortune prior to his inauguration, with the expectation of doing the same thing on retirement.

Pres. Grau's ambitious program included a complete reorganization of the fiscal system, improvement of education, encouragement of health, sanitation and highway projects and continued agricultural diversification. Cuba was hit in mid-October by the most severe hurricane in some 20 years. Advance warnings held down the loss of life but crop damage, especially near Havana, was heavy. The congress appropriated 5,000,000 pesos for relief and private sources contributed 600,000 additional.

The sugar crop for 1944, most of which was under contract to the United States, was one of the heaviest on record. The U.S. in January announced an agreement to purchase 800,000 short tons of invert molasses; arrangements were later made to buy 65,000,000 gallons of blackstrap molasses and 12,500,000 gallons of industrial alcohol, thus largely absorbing the 1944 crop. Negotiations with the United States over the 1945 sugar crop began in Washington in Aug. 1944, after some dispute in Cuba over the attempt of Cuban labour to obtain representation on the delegation. Arguing higher production costs, Cuba contended for a price up to 3.55 cents per lb. and a long-term contract, but the negotiations were stalemated for several months. Cuban labour unrest was considerable in 1944 because of the sharp inflation which price control machinery had been unable to check. The president decreed wage increases in several industries early in the year under a law which allowed him to raise wages on a cost-of-living basis. He set minimum wages for both urban and rural workers, effective in May, and also increased the army pay. A contributory retirement fund for sugar workers was likewise created. Batista in August decreed a general wage increase of 10% to 20% and at the same time froze all prices at the current level. Some labour agitation continued under Grau San Martín despite a determined effort to make price controls effective. Food shortages, especially in meat and dairy products, continued in 1944 and a tem-

porary beef subsidy, up to one cent a lb., proved necessary to obtain meat for Havana during the summer.

The decision of the strong Popular Socialist party (formerly the Communists) in Feb. 1945 to continue to back President Grau allowed the administration to retain a senate majority. Some loss of Republican party support was seen in December in the resignation of Minister of State Cuervo Rubio. Several plots were reported at various times, the most serious being one led in March by the former chief of staff, José Pedraza. Several political assassinations occurred during the year, and the government was severely criticized in some quarters for failure to maintain order. Batista remained away from Cuba on a leisurely trip through the other American republics, but his public statements on various occasions indicated that he was not through with Cuban politics. One statement, in August, that there was no possibility of agreement between himself and Grau, suggested that he would join the opposition when and if he should return to Cuba; on the other hand, rumours of a proposed criminal investigation of Batista administration acts were frequently heard in 1945. Reports of possible cabinet changes were frequent through the year but the only major reorganization, affecting four posts, came in October.

Sugar sales negotiations were of concern throughout the year. The contract covering the 1945 crop, incompleted at the end of 1944, was signed only at the end of March 1945. Meanwhile, shipments had in January been authorized in advance. The United States in March agreed to buy the bulk of the crop at 3.10 cents per lb.; the contract also involved substantial purchases of blackstrap and industrial alcohol and a guarantee to protect Cuba against price increases on basic foodstuffs shipped from the United States. Negotiations for sale of the 1946 crop, which started soon afterward, were quickly stalemated over inability to agree on purchase of the 1947 and 1948 crops.

Sentiment in Cuba, led by student groups and Communists, developed strongly in 1945 for a diplomatic break with Franco Spain. Both houses of the congress endorsed the idea in October, but the government refused to take the step, probably because few other American republics had done so. When Manuel Aznar, new Spanish ambassador to the United States, arrived at Havana in July en route to Washington, students stoned the Spanish embassy. Popular sentiment favoured recognition of the Spanish government-in-exile in Mexico City. Cuban commercial relations with Spain were bettered by a decree of April 23 releasing frozen Spanish credits. Cuba took a prominent part in the Mexico City Inter-American conference and the United Nations San Francisco conference in 1945, and ratified the U.N. charter in October. Grau announced in December that the Cuban contribution to U.N.R.R.A. would include 20,000 tons of sugar, \$1,000,000 in cash and certain technical aid.

Much labour unrest prevailed in 1945, due partly to inflation and to continuing shortages of goods; government price control proved largely ineffective. Strikes occurred in the sugar industry and in transportation and in most cases the government authorized wage increases. A July decree restricting employment of foreign technicians was of concern to foreign corporations. A serious drought early in 1945 added to the general hardship.

Sen. Miguel Suárez Fernández, an Auténtico, was elected president of the senate on Dec. 12, 1945, thus giving control of the senate to Grau's forces. Juan Marinello, formerly a prominent Communist leader, was chosen vice-president.

In the municipal elections June 2, 1946, Dr. Manuel Fernández Supervielle, the coalition candidate, was chosen alcalde (mayor) of Havana; Auténticos won numerous legislative and municipal seats. An attempted revolt at Camp Columbia, near Havana, on May 17, was easily suppressed. Most dissatisfaction during the year came from the excessive cost of living and from high taxes; Havana merchants on Mar. 7, 1946, demonstrated before the presidential palace demanding tax relief.

Cuba on Dec. 12, 1945, rejected the Uruguayan proposal for collective intervention as an inter-American policy. Political relations with the United States continued close. On Jan. 3, 1946, the United States returned control of the naval air base at San Julián to Cuba and other wartime bases were surrendered May 20, the anniversary of Cuban independence.

Cuba and the United States on July 22, 1946, signed a two-year sugar contract after negotiations of ten months. It provided for U.S. purchase of the 1946 crop, less retained quotas, at 3.675 cents per lb., with provision for price increases if Cuban food prices or the cost-of-living index increased; the 1947 crop was to be purchased at a price equal to the highest 1946 price; specified amounts of black-strap and industrial alcohol were to be purchased; and the United States guaranteed that no legislation harmful to the sugar industry would be adopted. (See also West Indies.)

(R. H. Fn.)

The New Constitution of 1940.—Cuba was administered under provisional statutes and by a Council of State from 1934 to April 1936, which was replaced by a congress of senators and representatives elected by the people. The constitution of 1901, ratified by a popular referendum during the United States occupation, had been replaced by another in 1928, compiled and imposed by the "cooperativist" oligarchy with the aim of curbing the powers of the elected representatives of the people. The people rose against it, and after five years of bloody street-fighting, the government of General Gerardo Machado was overthrown, congress was dissolved and a provisional government established; the latter abolished this constitution in Aug. 1933.

In Nov. 1939, 11 political parties, ranging from the extreme left to the far right, elected 79 delegates who discussed and agreed on the progressive Carta Fundamental (Fundamental charter) to form the new basis of government in Cuba, probably one of the most advanced in the Western Hemisphere. The constitution was put into effect on Oct. 10, 1940, by Pres. Batista, as the orders for transition by the Constituent Assembly required. The charter declared the complete sovereignty of the people of Cuba, free from the Platt amendment contained in the constitutions of 1901 and 1928, under which the United States of America had the right to political and military intervention in the internal affairs of the Republic. The Platt amendment had been disavowed by the revolution of Sept. 4, 1933, led by Batista, sergeant of the army at that time, and was abolished officially in 1934 by an accord between Presidents Roosevelt and Mendieta, of the United States and Cuba respectively. The new constitution abolished presidential re-election, removed the death penalty and made primary education obligatory and free. The National university became autonomous; official education had no religious influence. The right of employers, workers and other employees to form unions was recognized; the right to strike was given to workers and the right of lockouts to employers, and it was made obligatory for professional men to join their appropriate organizations. All citizens, unless physically or mentally unable,

were equally obliged to vote in the universal secret elections. Cuba, a lay state, continued to protect the practice of all religions, despite the vast majority of Catholics.

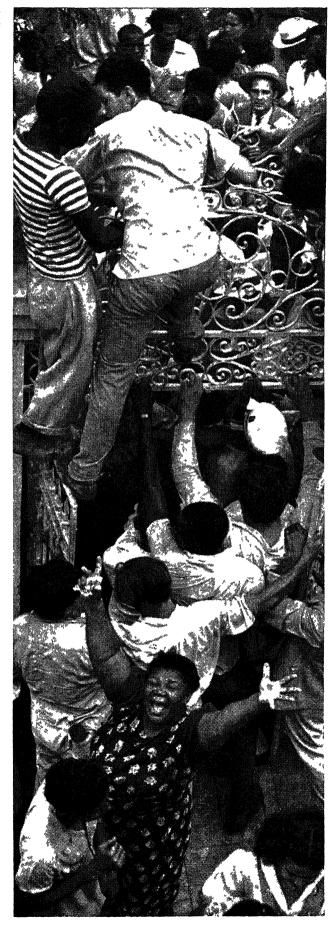

The Government became semi-parliamentarian, with three branches: executive, legislative and judicial. The first consisted of a president and a vice-president elected for four years. The president of the republic was to be assisted by a council of ministers—12 full ministers and up to 5 without portfolio whose number was to be fixed by law—headed by a prime minister freely appointed by the president, who as chief executive became supreme commander of all land, sea and air forces. The members of the cabinet were made responsible to congress for their actions, and congress could bring about a cabinet crisis by expressing lack of confidence in the cabinet or any member thereof, but it could not exercise this power twice within a period of six months.

The legislative branch was made up of the chamber of representatives and the senate. Congress was given the authority to sit in judgment of any president of the republic, cabinet minister, or governor accused by the chamber of representatives of breach of the constitutional limitation of his authority. The senate was to consist of 54 senators, or 9 from each province. The chamber was made up of 1 representative for every 35,000 inhabitants according to the census of the population, with one-half the membership renewed every 2 years. Congress was to meet twice every year regularly, and the two houses must remain in session not less than 60 days on both occasions; but the session of the senate and chamber combined should not last for more than 140 days. Both the president of the republic and congress itself acquired the right to agree to special sessions. Every citizen was to have the right to submit proposals for a legislative measure to congress, but the two houses were obliged to consider such a proposal only if the petition carried 10,000 signatures.

The power of the judiciary was vested in the Tribunal Supremo, the Tribunal Superior Electoral, and the other tribunals and judges established by the law. The judiciary profession was to be entered through competitive examinations, and advancement was to be made gradual through a system of step-by-step promotions. However, judges of the Tribunal Supremo, the Tribunal Superior Electoral, and the Tribunal de Garantias Constitucionales y Sociales were to be chosen by extraordinary selection without any decisive influence of the executive. The Consejo Superior de Defensa Social was empowered to carry out the decrees and measures of security relating to the deprivation and limitation of individual liberty, as well as to control all establishments and institutions necessary for the prevention of crime. The Tribunal para Menores as well as the Tribunal de Garantias Constitucionales y Sociales, were not yet functioning in 1946.

The constitution recognized municipal autonomy and respected the administration of the municipalities as established in the constitution of 1901. The municipalities might divide to form new ones or include themselves in others, always with the approval of both houses of congress. The mayor and his aldermen were to be elected directly by the people. The municipalities were divided into city and rural boroughs. Every municipality could establish its own charter after the election of a commission of 15 members to compile it.

The provincial government was made up of the muni-

cipalities of each province; it comprised a governor elected for four years and the council of mayors of the province. This replaced the system of provincial councils in effect since the beginning of the republic.

The constitution of the republic could not be changed without a request from more than 100,000 electors or by initiative of congress; but in either case it was necessary that congress approve the reform by a three-quarter majority vote, and that it be ratified by two-thirds of the total number of electors in each province.

Re-election of the president was prohibited and "he who has occupied the presidency of the Republic once cannot hold it again for eight years after having ceased to

be in office."

Cunningham, Sir Alan Gordon

Sir Alan Cunningham (1887-), British army officer and colonial official, was born May 1, 1887, a brother of Viscount Cunningham of Hyndhope (see below). A student of the Royal Military academy, Woolwich, he was commissioned in 1906 and served both in the field and as a general staff officer in World War I. In World War II, Sir Alan commanded British forces that conquered Italian Somaliland and liberated Addis Ababa in April 1941. Subsequently, he was appointed commander of the British 8th army and launched a surprise attack, Nov. 18, 1941, against Rommel's forces in Libya. The drive was quickly halted by the axis armies. Eight days later (Nov. 26), Sir Alan, who was reported suffering from overstrain, was granted sick leave and replaced by Maj. Gen. Neil Methuen Ritchie.

Returning to England, he was commandant of the Staff college at Camberley in 1942 and general officer in command of British forces in Northern Ireland, 1943–44. His appointment as British High Commissioner and commander in chief for Palestine and High Commissioner for Trans-Jordan, was announced Nov. 8, 1945. Soon confronted with terrorism, instigated by Palestinian Zionists in protest against Britain's restrictions on Jewish immigration, he decreed the death penalty for persons violating defense regulations.

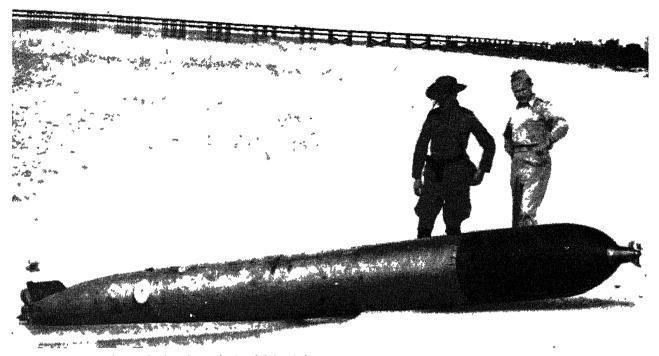

Cunningham of Hyndhope, Viscount

Viscount Cunningham (Andrew Browne Cunningham)), British naval officer, was born in Bishop's Waltham, Hampshire, England. He entered the Royal Navy at the age of 15, soon rising to the rank of a commissioned officer. Commander of a destroyer during World War I, he conducted daring raids against German shipping in the Mediterranean. A rear admiral from 1933 to 1936, he was appointed vice admiral in command of a battle cruiser squadron in 1937. He also was lord commissioner of the admiralty and deputy chief of the navy staff, 1938-39, and was named commander in chief of the Mediterranean fleet in 1939. In April 1940, Sir Andrew commanded the British naval squadron that entered Narvik fjord and sank seven German destroyers. Later, he returned to the Mediterranean, where he resumed command of the Mediterranean fleet (for a brief period during this time he headed a British naval delegation to Washington). The fleet under his command played an important part in the Allied victories in North Africa in 1942. He was promoted to the rank of admiral of the fleet, Jan. 1943. He succeeded Admiral Sir Dudley Pound as first sea lord and naval chief of staff in October.

He attended the Tehran and Yalta conferences, was made a baron in 1945 and a viscount, Jan. 1, 1946. He retired Feb. 28, 1946.

Curação

Curaçao is an island off the Venezuelan coast, near the mouth of Lake Maracaibo. The same name is applied to the six West Indian islands which form the Nether-

German torpedo on the beach of Aruba in the Dutch West Indies after it had missed its target during a nazi submarine attack on the harbour of this important petroleum centre Feb. 16, 1942. Shortly after the photograph was taken the torpedo exploded, killing four men

lands colony of Curaçao; that colony, along with Surinam or Dutch Guiana, constitutes the only new world possessions (officially called "overseas territories") of the Netherlands. The three islands in the Leeward group (sometimes referred to as the ABC islands), about 40 mi. north of the Venezuelan coast, include Curação (210 sq.mi.; est. pop. in 1944, 78,587), Bonaire (95 sq.mi.; pop., 1944 cst., 5,798); and Aruba (69 sq.mi.; pop., 1944 est., 39,318). The three small islands in the Windward group, about 500 mi. northeast, with their areas and 1944 estimates of population, include the southern part of St. Martin (17 sq.mi.; pop., 1,877; the remainder of St. Martin belongs to France); St. Eustatius (7 sq.mi.; pop., 1,092); and Saba (5 sq.mi.; pop., 1,194). The total population was thus 127,866. Total population as estimated in 1938 was 101,021 (including 62,798 on Curação and 28,155 on Aruba). The estimate of population in 1941 was 109,592 (Curação, 68,217; Aruba, 31,522; Bonaire, 5,556; St. Martin, 1,938; Saba, 1,213; St. Eustatius, 1,146). Negroes predominate in the population of all of the islands, accounting for 80% on Curação, 85% on Aruba, 90% on St. Eustatius, 95% on Bonaire and St. Martin, and 65% on Saba. Other principal components of the population were (1943 est.) 7,511 English, 5,156 Dutch and 4,213 Venezuelans; some 50 nationalities were said to be represented altogether. Many of the small shopkeepers were Poles, Rumanians, British West Indians and Syrians; Chinese operated restaurants, laundries and truck gardens, while many of the labourers were Portuguese. European Netherlanders usually were employed by the government and by the oil industry or other private concerns. The only important town is the colonial capital, Willemstad (pop. est. 1943, 33,062; 1938, 30,453; 1939, 31,264) on Santa Anna bay in Curação. Dutch is the official language, but many of the inhabitants speak a patois known as Papiamento, composed of Spanish, Dutch, English, Portuguese,

Carib, and native African words. Roman Catholicism is the dominant religion.

The territorial administration is headed by a governor, appointed by the crown and assisted by an appointive advisory council. A second council, the *Staten*, is composed of 15 members, of whom five are appointed by the governor and 10 elected, serving for four-year terms. Voters number only 5% of the population. The island of Curaçao is divided into three districts: Willemstad, Eastern Curaçao and Western Curaçao. The outlying islands are administered by underlying officials called *gezaghebbers*. Governors during the decade 1937–46: G. J. J. Wouters, until July 16, 1942; Dr. Pieter A. Kasteel, after that date.

GERMAN conquest of the Netherlands in May 1940 and the subsequent collapse of France seriously affected Curação, which previously had felt World War II relatively little. Canadian and French troops were landed in Curação and Aruba in the summer of 1940 to protect the colony's oil-refining industry, refineries on those two islands (operated by Royal Dutch Shell and Standard Oil of New Jersey and their subsidiaries) being considered among the largest in the world. The French troops were later withdrawn, but other United Nations forces continued to occupy the key islands throughout the war. Output of the refineries was considerably curtailed under wartime conditions, with adverse effects upon employment and other business. The colony benefited, however, from the transfer of the Royal Dutch Shell company's home office to Willemstad and from the arrival of numerous refugees who took up residence. The islands maintained unquestioned loyalty to the Netherlands government-inexile. Proposals made at the Second Foreign Ministers' conference at Havana, Cuba, in July 1940 that a scheme of "provisional administration" be planned for the American possessions of European powers in the event that nazi Germany should attempt to establish control over them met with sharp disapproval in Curação so far as the

possible application of the plan to that colony was concerned.

Curação continued to be dominated throughout 1941 by wartime activity, and the increasing demand for its products led to expansion of the already extensive refining facilities. Building construction was especially active; one of the more notable projects was a 600-ft. ship drydock. Defenses, including air-raid shelters, were steadily extended as handling of petroleum for war needs made Willemstad one of the busiest war ports in the world. Curação and Aruba were both subjected to direct axis attacks early in 1942; even more stringent defense precautions were maintained thereafter. The entire colony increasingly felt the pinch of the shipping shortage as a result of submarine warfare in the Caribbean and of diversion of ships to other war needs. Shipping shortages continued in 1943, and the colony hence suffered a scarcity of some items, especially of consumer goods. A 50% increase in price levels occurred during the year. Maximum prices were set on essentials early in the year, and the government issued food cards in March 1943 in anticipation of later food rationing. Because of the rise in living costs, government and refinery employees were given a 30% wage increase on Aug. 31, retroactive to July 1, 1943. The petroleum refining industry continued to expand its facilities. Demand for labour in that industry (with considerably higher wages paid) resulted in the premature ending of the harvesting of aloes in Sept. 1943, with only three-fourths of the crop gathered. Phosphate mining also came to a standstill, chiefly because supplies on hand had been built up to a sufficient size to meet demands for some time to come. Venezuelan military observers went to Curação in March, under agreement with the colonial government. Direct radio-telephone communication with the United States began operation for the first time on Dec. 20, 1943.

Pronouncements made by Netherlands officials in May 1944 indicated that the empire would be reorganized following the war to provide for a considerable degree of decentralization and local self-government. Inhabitants of Curação thereupon looked forward to a greater amount of autonomy, although details as to how the plan would be worked out were not then announced. Princess Juliana of the Netherlands visited Curação and Aruba late in February and early March 1944. Officials of Curação continued their close co-operation with the war effort; 1944 was marked especially by closer relations with officials of the United States and Venezuela. Gov. Pieter Kasteel on April 3, 1945, received U.S. Senators James M. Mead, James M. Tunnell and Homer Ferguson, present in the West Indies on an inspection trip. Commodore L. W. Busbey, Jr., succeeded Rear Adm. Frank E. Beatty as commander of the Allied naval forces, stationed in Curação on May 16. Curação's interest in the possibility of a greater degree of autonomy revived at the end of the war. Economic conditions, insofar as they were affected by shipping, gradually improved in 1945. One of the Aruba refineries, the world's largest, completed in 1945 the processing of the 1,000,000,000th barrel of oil since its opening in Jan. 1929. The Aruba refineries began experiments with hydroponics in order to reduce the need for imported foodstuffs.

Dutch officials representing the territory of Curaçao participated with British, U.S., and French officials representing the respective Caribbean colonies of those powers in a conference in the Virgin Islands (of the United States) beginning Feb. 21, 1946. The conference dealt

with common problems affecting the territories and colonies in Middle America, including those of financial assistance for agriculture, industry and trade, employment and living standards, the extension of a minimum wagerate system, enforcement of employment standards and others. A Caribbean customs union was tentatively proposed, but the plan did not meet with approval. The former Anglo-American Caribbean commission, organized by joint agreement between Great Britain and the United States on March 9, 1942, was broadened in 1945 to include representatives and colonial interests of the Netherlands and France.

Curling

Once again Canada held close to its two and one-half to one ratio in the annual pursuit of the Gordon International medal, leading trophy of curling. The United States won only two of the yearly bonspiels after 1937, capturing the event in 1939 and 1946. Interest in curling increased considerably during the decade 1937–46, although World War II hindered competition from 1942 to 1945.

Of the various curling trophies contested each year, the Munson shield ended one of the longest stays in one place when the Royal Montreal (Canada) team won it in 1940. Previously Utica, N.Y., regarded as the mecca of U.S. curling, had held the Munson shield for eight years. The Utica Curling club salvaged the Mitchell medal in 1940, while the Saranac Lake Curling club won the Patterson medal and Schenectady, N.Y., won the Douglas medal.

The Schenectady Curling club won both the Gordon Grand National and Richard S. Emmet medals in 1941, while Ardsley, N.Y., won the Allen medal. Schenectady

captured its fourth straight Gordon Grand National medal in 1942, marking the sixth time Bevis P. Coulson skipped a rink to the Gordon title. The New York Caledonians won the Richard S. Emmet and Fred Allen Memorial medals.

Skipped by novelist Ben Ames Williams, the Country club of Brookline, Mass., annexed both the Mitchell and Allen medals in 1943. It marked the first time in 12 years that a rink had won both medals. In 1944, the Schenectady Curling club duplicated Brookline's double conquest in the Mitchell and Allen competition, and added the Gordon medal for a three-way sweep. Ardsley captured most of what was left in the way of U.S. laurels, winning both the Emmet and Douglas medals.

Once again the Mitchell and Allen medals went to the same team in 1945, Utica accomplishing the sweep with victories over Ardsley in both finals. Utica also won the Emmet medal, but lost the Gordon medal final to the New York Caledonians. The Toronto Granites won the Douglas medal.

The Caledonians repeated as Gordon medal winner in 1946, while Utica scored another double by taking the Griffith and Emmet medal competition. Brookline won the Douglas medal.

Currie, Lauchlin

Currie (1902-), U.S. economist and government official, was born Oct. 8, 1902, in West Dublin, Nova Scotia, becoming a naturalized U.S. citizen in 1934. A graduate of the London School of Economics, 1925, he received his Ph.D. degree from Harvard in 1931. He joined the Harvard faculty, serving as instructor from 1927 to 1934. Subsequently, he was professor of international economics at the Fletcher Graduate School of Law and Diplomacy at West Medford, Mass., 1933-34. In 1934 he became senior analyst for the U.S. treasury and later was associated with the Federal Reserve board. Appointed in 1939 as administrative assistant and counsel on economic affairs to Pres. Roosevelt, Currie made two trips to China, one in 1941 to study Chungking's lend-lease needs and another in July 1942 for consultations with Generalissimo Chiang Kai-shek on speeding U.S. war supplies to China's armies. Currie was appointed as one of the deputy administrators to the Foreign Economic Administration on Oct. 26, 1943. In Jan. 1945 Currie went to Switzerland to negotiate a new trade agreement with the Berne government designed to cut down Swiss trade and transit movements to the reich. Currie, who returned to Washington on Mar. 19, 1945, reported that he considered the mission "obtained complete success in all our objectives."

With the abolition of the FEA in Sept. 1945, he left the government service.

In early 1946 Currie, who had become president of the American Council for Italian-American affairs, made an inspection tour of Italy to study the progress of reconstruction for the council.

Cycling

Cycling, an international sport, produced an abundance of activity despite the restrictions placed upon it during the years of World War II.

With 1,130,736 bicycles manufactured in the United States alone in 1937, the revival of the sport, which had risen to heights at the turn of the century and then receded in popularity, was on a grand scale. Foreign riders, in particular, captured the public eye in 1937. The 31st Tour de France race was won by Roger Lapeble of France, who covered the 2,775-mi. circle around that country in 26 days. Italy's entrants were second and Germany's third. In England, the team of Piet van Kempen of the Netherlands and Henri Buysse of Belgium won London's six-day race. The Isle of Man bicycle race was captured by J. Fancourt, who covered two laps of the difficult course in 3:28:43.6 for an average speed of nearly 22 mi. an hour.

Only two champions were able to retain their titles during 1938. Jan van der Vyver of the Netherlands kept his crown as the amateur sprint champion of the world, and Mickey Francoise of Montclair, N.J., for the third time in succession prevailed over the amateur sprinters of the U.S. The sensation of the year in the sport was the unexpected downfall of Josef Scherens of Belgium as the world professional sprint champion. Arie Van Vliet of the Netherlands succeeded him. Van Vliet thus brought to an end one of the greatest streaks in the annals of the sport. Scherens, previous to 1938, had won the professional sprint title six years in a row.

The professional motor-paced championship of the world was won by Eric Metz of Germany, who succeeded his compatriot, Walter Lohman, 1937 crown-wearer. To Marcel Kent of Belgium went the world professional road title, and to H. Knecht of Switzerland went the world amateur road laurels. Albert Sellinger of Newark, N.J., became the U.S. national professional sprint champion, dethroning Mathias Engel of Germany. The National professional motor-paced crown was won by Tino Reboli, also of Newark, who dislodged the Belgian veteran, Gerard Debaets. The great German team of Gustav Kilian and Heinz Vopel continued to dominate six-day competition. The Belgian pair of A. Buysse and A. Billiet won the Wembley six-day bike race in London. They covered 1,950 mi. and four laps and gained 1,348 points.

Arie Van Vliet of the Netherlands was the only world champion to retain his title in cycling during 1939. He kept his world professional sprint championship by default after he and Josef Scherens of Belgium had reached the final of the competition at Milan, Italy. In the heat to decide the championship, Scherens was injured and thus the title stayed with Van Vliet automatically.

This was the year which saw war subsequently reduce cycling to a mere record sheet. War activities compelled the abandonment of many cycling events, among them those designed to produce the professional motor-paced and professional road champions. Thus the above-mentioned sprint crown was the only world professional championship held during 1939. The world amateur sprint honours went to Jan Derkens of the Netherlands, who succeeded his countryman, Jan van der Vyver. George Shipment of Brooklyn took the national professional sprint crown, and Tino Reboli, Newark, retained the national professional motor-paced championship. The national amateur sprint laurels were won by Howard Rupprecht of Maplewood, N.J. Robert Stauffacher of San Francisco

took the national A.A.U. senior crown, and Eddie Carfagnino became the National Cycling association senior champion.

In 1940 the U.S. still clung to a few events in the sport, principally the six-day classic. At Buffalo, Heinz Vopel of Germany and Cecil Yates of Chicago won the six-day international bicycle race, amassing a total of 170 points after 2,025 mi. of riding. When a similar event was held in Columbus, O., Gustav Kilian and Henry O'Brien were the top pair of riders. Vopel also paired with Cesare Moretti to win the 18-mi. international motor-paced race in 40 min. and 20 sec. The National Olympic bicycle racing championship was captured by Ed Carfagnino.

With virtually all important cycling events cancelled for the duration of World War II and most leading riders engaged in the armed services of their respective countries, the American Bicycling league selected, in 1941, an All-American standing as follows:

Name	City	Points
George Hurlburt, Jr.	Buffalo	275
Furman Kugler	Somerville, N.J.	195
Jerry Kandler	Milwaukee	190
Iggy Gronkowski, Jr.	Buffalo	115
George Wolf	San Francisco	98 85 84
Johnny Weber	Milwaukee	85
James Dolle	Irvington, Ind.	84
Isamer Fiyuyama	Honolulu	79
George Edge	Philadelphia	
Harry Naismyth	Somerville, N.J.	74 67 65 64
Bruce Burgess	Irvington, Ind.	65
Francis M. Cabe	Honolulu	64

A summary of the 1941 records, which stood throughout the war, follows:

The N.C.A. sprint championship was won by Tom Saetta of Brooklyn, while Mike DeFilipo of Newark won the paced title. The A.B.L. senior road championship was won by Marvin Thompson of Chicago, and the junior title went to Andrew Bernadsky of San Francisco. The girls' champion was Jean Michels of Chicago.

The track championships of the A.B.L. were won by Bob Stauffacher of San Francisco, who triumphed in the senior class, and Chuck Edwards of Chicago, winner among the juniors. Stauffacher also captured the Century Road club's senior title.

The only international event that year was a race over the Inter-American highway from Tegucigalpa, Honduras, to Guatemala City. A Guatemala team won, with Fraterno Vila the individual star.

In 1943, although recognized competition was still absent from the world sports scene, an encouraging announcement came from Cy Panitch, president of the Bicycle Club of America, who asserted that membership had risen 25% in one year. Furman Kugler, second ranking rider in the U.S., won the New Jersey state cycling championship, in one of the rare title events, with a total of 16 points, having finished first in the 5-mi. and 10-mi. races sponsored by the Amateur Bicycle league of America.

Following V-J day, announcements came quickly of the restoration of the leading cycling events. Announcements of return to activity were made known by the American Bicycling league, the National Cycling association and other ruling organizations in the sport throughout the United States, Great Britain and Canada. Cyprus

The island of Cyprus is situated in the easternmost basin of the Mediterranean, with Asia Minor to the north and Syria to the east, at distances of 60 and 41 mi. respectively. Area: 3,572 sq.mi.; pop. (1931 census) 376,529; (est. 1943) 395,124. Chief towns: Nicosia (cap. 23,507); Larnaca (11,715); Limassol (15,066); Famagusta (8,771). Languages: Greek and Turkish, the Greek-speaking element comprising about 80% of the total population. Religion: Mohammedan as to some 16% of the population, the remainder being, for the most part, Christians of the autocephalous Church of Cyprus, a branch of the Orthodox Eastern Church. Governors (with dates of assumption of office): Sir Richmond Palmer (Dec. 21, 1933); Sir William Battershill (Aug. 10, 1939); Sir Charles Woolley (Nov. 25, 1941); Lord Winster (Oct. 5, 1946).

* * *

Cyprus, like Malta (q.v.) had passed through a period of some difficulty during the years that preceded the decade 1937-46. Serious disturbances had occurred in the island in 1931. They arose out of what was known as the "Enosis" movement, which was based on a demand put forward by the Greek-speaking inhabitants for union with the kingdom of Greece. The disturbances made it necessary to assert British authority in a manner that would prevent further outbreaks. The legislative council was abolished at the end of the year and power to legislate was vested in the governor alone. These conditions still prevailed when World War II broke out in Sept. 1939 and remained unchanged, so far as the central government was concerned, until the end of the decade, though steps were taken during the war to restore some measure of local selfgovernment in municipal and rural districts. It was announced in the British parliament in Oct. 1946 that a consultative assembly was to be called together in Cyprus to consider the framing of proposals for constitutional reform, including the re-establishment of a central legisla-

There were military developments in the colony even before World War II. Proposals for raising a regular infantry battalion in Cyprus were not proceeded with, but the question of forming Cypriot units of the royal engineers, royal army service corps, and other services were under active examination in the early part of 1939. On the outbreak of the war some 500 Cypriots were at once enlisted in R.A.S.C. mule transport companies. These 500 men arrived in France in Jan. 1940 and were actually the first British colonial troops to take the field against the Germans. Subsequently, Cypriot transport units saw service in the middle east, in Greece and in Italy, where five pack transport companies served with distinction at Cassino in May 1944.

Cyprus remained immune from axis attack (apart from a limited number of air raids) throughout the war, but it was in the danger zone for some two and a half years after the spread of hostilities to the Mediterranean, and active preparations had to be made for its defense. British troops in considerable numbers were stationed in the island throughout this period. When Cyprus was first assigned to Great Britain in 1878 it was described by a British minister of the day as "a place of arms in the Levant, where our ships can lie in bad weather and troops and stores can be held ready for action." That was, in fact, very much the role that the island discharged during World War II.

Following a visit paid to the colony by Sir Ralph Oakden in 1935, various irrigation projects were planned and brought into operation. In 1936 a grant of £30,000 was made from the Colonial Development fund for an intensive exploration of underground water resources. The investigation started in the following year. During the war Cyprus derived substantial benefit under the Colonial Development and Welfare Act of 1940. A grant of £200,000 was made in 1941 for afforestation and forest road construction. In 1943 further grants were made, amounting in all to about the same sum, for the promotion of irrigation schemes. Additional grants for local irrigation projects, involving a total expenditure of £248,250, were approved under the act during the year 1944–45. The forest produce of Cyprus made a substantial contribution to military requirements during the war.

Labour trouble manifested itself in Cyprus at different periods throughout the decade. A number of strikes occurred during the early part of the war, and a somewhat critical situation arose in 1940 when a strike of the mechanics and electricians in the public works department led to the threat of a general stoppage of work if the strikers' demands were not met. Matters were adjusted, and no general strike in fact took place. Further stoppages, following for the most part upon the demand for increased wages to meet rising costs of living, took place in 1943 and 1944. A strike at a local factory in Limassol in April 1944 was accompanied by bomb outrages in the town, but there were no casualties. In the following month a local commission of inquiry made a number of recommendations for the improvement of conditions of employment, both for skilled and for unskilled workers. The trade union movement made great progress in the island during the war years; it received every official encouragement.

Czechoslovakia

†£495.

*1945.

An independent republic in central Europe, Czechoslovakia was established in 1918, dismembered in 1938–39 by Germany and restored in 1945 to its pre-Munich frontiers with the exception of Subcarpathian Ruthenia, ceded to the U.S.S.R. (Moscow treaty, June 29, 1945). Area (before the dismemberment): 54,236 sq.mi.; (after restoration): 49,321 sq.mi.; pop. (census Dec. 1, 1930): 14,729,536; (est. Dec. 1, 1937): 15,167,800; (est. Dec 30, 1946): 12,003,000, the decline in population being explained mainly by the departure of the Germans and the cession of Subcarpa-

thian Ruthenia (pop. 1938 est. c. 725,000, of whom 65% Ruthenians, mainly Greek Catholics). Chief towns (first figure 1930 census, second figure June 30, 1946, est.): Prague or Praha (cap., 848,823; 923,946); Brno (264,925; 268,873); Moravská Ostrava (125,347; 175,639); Bratislava (123,852; 138,966); Plzen (114,704; 122,753). According to the 1930 census the population of Czechoslovakia comprised the following nationalities: Czechs and Slovaks (66.2%); Germans (22.5%); Hungarians (4.9%); Ruthenians (3.9%); Jews (1.4%); Poles (0.7%); others (0.4%). President: Dr. Eduard Beneš, elected on Dec. 18, 1935, after the resignation of Thomas G. Masaryk, resigned on Oct. 5, 1938, and left the country; Dr. Emil Hácha was elected president on Nov. 30, 1938, and retained his post after the creation by Germany of the protectorate of Bohemia-Moravia; his tenure of office ended when an anti-German rising broke out in Prague on May 5, 1945 (he died on June 27, 1945, while awaiting trial). On May 19, 1939, in Chicago, Dr. Beneš assumed the leadership of the Czechoslovak National committee recognized by France on Nov. 17, 1939, and by Great Britain on Dec. 20, 1939, as "qualified to represent the Czecho-Slovak peoples"; on July 21, 1940, Great Britain recognized the national committee as the provisional Czechoslovak government and Dr. Beneš reassumed the function of president of the Czechoslovak republic; on July 18, 1941, he was fully recognized in this capacity by Great Britain and the U.S.S.R. and on July 30, 1941, by the U.S.; since he had been elected in 1935 for seven years, on Dec. 4, 1942, the Czechoslovak government in London declared Dr. Benes' office prolonged until a new president should be elected by a national assembly in Prague. Returned to the capital on May 16, 1945, Dr. Benes was confirmed in office by the provisional national assembly on Oct. 28, 1945, and unanimously re-elected for

seven years by the constituent assembly on June 19, 1946. Prime ministers: Dr. Milan Hodza (Nov. 5, 1935–Sept. 22, 1938); Gen. Jan Syrovy (Sept. 22, 1938–Dec. 1, 1938); Rudolf Beran (Dec. 1, 1938–March 18, 1939).

By the Munich agreement of Sept. 29, 1938, Czechoslovakia was forced to cede to Germany an area of 11,071 sq.mi. with c. 3,653,300 inhabitants; on Oct. 1, 1938, by a direct agreement with Poland, Czechoslovakia ceded to the former a part of Cieszyn or Teschen Silesia (349 sq.mi., 227,000 inhabitants, including, according to Pol-

ish statistics, 156,600 Poles); by the Vienna award on Nov. 2, 1938, Germany and Italy forced Czechoslovakia (or rather Slovakia and Subcarpathian Ruthenia) to cede to Hungary an area of 4,566 sq.mi. with a population of c. 1,027,500. After these territorial changes Czechoslovakia had 38,258 sq.mi. and 10,260,000 inhabitants, of whom 6,750,000 were Czechs, 2,200,000 Slovaks, 640,000 Ruthenians, 470,000 Germans and 200,000 Hungarians. Under German pressure the remaining Czecho-Slovakia (spelled with a hyphen) took the form of a federal republic with an autonomous Slovak government in Bratislava (prime minister: Father Josef Tiso, appointed by the Prague government on Oct. 6,

1938) and an autonomous Ruthenian government in Chust (prime minister: Father Augustin Vološyn, appointed by the Prague government on Oct. 9, 1938). On March 15, 1939, however, the German army occupied Prague and the following day Germany created the protectorate of Bohemia-Moravia; Slovakia and Subcarpathian Ruthenia (now Carpatho-Ukraine) proclaimed on March 14 their independence. The latter existed only one day because Germany authorized its occupation and annexation by Hungary.

On March 18, 1939, Chancellor Adolf Hitler appointed Baron Konstantin von Neurath reich protector of Bohemia-Moravia; Dr. Hácha remained president, but Beran resigned as prime minister and was replaced by Gen. Alois Eliás. Arriving in Prague on Sept. 27, 1941, as deputy reich protector, Reinhard Heydrich arrested General Eliás (who was executed in June 1942) and on Jan. 19, 1942, appointed instead Jaroslav Krejci. Shot on May 27, 1942, by three Czech parachutists sent from London, Heydrich was succeeded by Kurt Daluege; Neurath, still nominally reich protector, was replaced on Aug. 20, 1943, by Wilhelm Frick. In Jan. 1945 Krej i resigned and was replaced by Rudolf Bienert. (See also SLOVAKIA.)

Shadow of the Reich.-By 1937 when Czechoslovakia lost her first president (who had already been succeeded in office by Dr. Beneš in 1935), the German danger for the republic had increased. It was the year in which Hitler's Germany had already completed its total breakaway from the policy of international co-operation. It was the year in which the aggressiveness of the separatist movement rose. Abroad, Konrad Henlein, leader of the pro-nazi Sudeten-Germans, leader of a minority working hard to secure justice within the framework of the republic, but at home, in company with Karl Hermann Frank, he initiated a radical campaign, declared the life of the German minority tantamount to "Babylonian captivity," and, coining the catch phrase of "self-determination for the German population in the Republic," declared war on the policy of the activist German parties and that of the Czechoslovak gov-

The close link between Henlein's aggressiveness and the policy of the German reich was publicly proclaimed in the first months of 1938. In his capacity as chancellor of the German reich, Hitler stood up in the reichstag on Feb. 20 and made known that "he would not tolerate the oppression of 10,000,000 Germans in two neighbouring States." First on his program was Austria. Events after that developed rapidly in Czechoslovakia. Henlein's party, strengthened by the joining up of German farmers and tradesmen, met only a month after the fall of Austria in Karlovy Vary, where it proclaimed the demands of the "Sudeten" Germans, which meant the breaking up of the Czech lands and the subordination of Czechoslovak policy to Germany's commands. There were few among the Czechoslovaks who did not know the aims of Henlein's policy and who was behind Henlein.

The months up to the autumn of 1938 were taken up with negotiations between the Czechoslovak government and the Henlein party, whose ever-rising demands proved the lack of good will for an agreement with the Czechoslovak majority. The mission of Lord Walter Runciman, whom the Czechoslovak government received in August so as to give proof of the magnanimity of its policy toward the minorities, could gain only the conviction of this lack of good will on the part of the Germans. It was a matter for regret that the mission did not know how to form the right conclusions on the basis of that conviction.

Tragedy of Munich.—After the British prime minister, Neville Chamberlain, had gone to Berchtesgaden and Godesberg for consultations with Hitler, on Sept. 29, the prime ministers of France and Great Britain met with Mussolini and Hitler at Munich and arrived at the agreement whereby they dictated to Czechoslovakia that it must give up an extensive border territory, the Sudetenland, to Germany and whereby, indeed, the entire Czechoslovak nation was being handed over to Hitler's naziism. The cession of half the Czech part of the Teschen area to Poland and of the frontier regions of Slovakia with Subcarpathian Ruthenia to the Magyars was a further chapter in that tragedy.

The second Czechoslovak republic, created by the Munich agreement of four powers, was no longer an independent and sovereign state. It was a sham state at the mercy of Germany, which took over all the former fortifications of the republic and its splendid armaments, secured all the railways, ordered the building of strategic highways and forced the new government, men picked to Hitler's liking, to grant to the rest of the Germans inside the Czech lands a privileged status.

The Czech nation, which accepted the second republic only with the bitterest of feelings, did not hide its opposition to the Germanophile regime. Despite this fact, the allegation that the rest of the German population were an object for oppresssion and maltreatment by the Czechs within the second republic, and that this was the justification for German armies to invade the Czech lands and occupy them, was a lie to further Hitler's policy. He made play of the disintegration of the republic, for events in Slovakia clearly developed under the influence and pressure of the reich's nazi policy, which put to its own use the anti-republic feeling of a number of autonomistic desperadoes in order to bring about the secession of Slovakia and to place it as an "independent" state under Hitler's protection. The events of March 15, 1939, together with the whole Berlin comedy which saw the wretched representative of the second republic suing for Hitler's protection, was simply the culmination of a development which began at Munich. The mutilated republic, whose frontiers were never guaranteed despite the promises of the powers at Munich, could not maintain itself by its own strength and fell into Hitler's lap at the moment he thought the situation ripe for further aggressive moves on the European chessboard.

The "Protectorate."-Instead of a second Czechoslovak republic there was then, in the heart of Europe, the protectorate of Bohemia and Moravia, set up by the Hitler decree of March 16, 1939. The protectorate was "autonomous" but had at its head a chief who was allowed to perform his duties only if he enjoyed the confidence of the fuehrer; it had a government approved by the reich protector. Its sovereignty could be claimed only "in accord with the political, economic and military interests of the Reich"; its foreign interests were looked after by that reich itself; it was subject to the customs sovereignty of the reich; the reichsmark was the legal tender; the military power of the reich and its secret police were installed and the administration of any one of its sectors could at any time be taken over by the reich authorities represented by the office of the reich protector-such was the framework of the new order of things in the historic lands of Bohemia.

After March 16, 1939, the Czechoslovak nation ceased to live politically. President Emil Hácha, who had the confidence of the fuehrer, tried to replace the remnants of the political parties still vegetating in the second republic by a "National Solidarity" (Národní sourucenství), but that

was merely a fragile façade composed of men amenable to German wishes, appointed to leading posts in that institution for duties to be performed only as directed by the reich and only for as long as it suited the Germans. There was of course no parliament, no regional authority; communal administrations had German members and commissioners foisted on them by nomination; the press was regimented and subordinated to Wolfram von Wolmar, the nazi press chief; the public offices were gradually Germanized; economic life was reorganized on German lines and adapted to German needs and social institutions were placed under German direction and control, in the same way as labour organizations. The anti-Jewish measures of the reich were likewise forced on Czech life. The gestapo censorship and the German press board were active. Schools were reorganized on the German system, and youth education was entrusted to German servants of the Kuratorium. The German greeting was obligatory in public life and at the offices, the swastika flag fluttered from public buildings and private houses on every conceivable occasion; several dozens of nazi "game beaters" headed by Emanuel Moravec, minister in the protectorate government, did all they could to drum and drill into the Czech people feelings of fealty to the German reich, and to make of the Czech lands a model province of the reich and a suitable ground from which could be launched further onslaughts of nazism on the eastern and southeastern areas of Europe.

The Czechoslovak nation, which accepted the second republic with the greatest self-abnegation in the autumn of 1938, could never be reconciled with the dispensation of March 1939. The relentless and self-sacrificing struggle which filled six whole years of the modern history of the Czechoslovak nation developed on two fronts; each demanded its own methods but they were from the start in lively moral and political contact and accord.

The first of these two fronts was the home front. Its army was the whole Czechoslovak nation which had to live under the German nazi yoke, physically shut off from the world outside and exposed to all the means of nazi terrorist rule. The beginning of the resistance struggle within the country may be traced to the last few months of the preprotectorate era when the necessity was realized for helping the Czech people, and particularly officers and soldiers, to escape across the frontiers so that they could become a nucleus of a future Czechoslovak army abroad. The stream of these voluntary Czechoslovak exiles, organized by soldiers, grew stronger after the nazi occupation of the Czech lands, reached maximum strength in the autumn weeks after the outbreak of World War II in Sept. 1939 and could not be dammed even when the war with Poland was successfully concluded by Germany. To the nation that stayed behind at home and that during the first few months of the occupation was already subjected to the rigours of the gestapo regime, there remained few means of resistance. It started forming itself into secret groups, family circles and close conclaves but never stayed dormant. It used means of every description, including an illegal press, to keep the national spirit from flagging: only three months after the occupation, it brought out the first issue of V Boj (Into Battle). There were no bans strong enough to prevent Czech people from getting in touch with their friends abroad. Czechs did not lose heart even after the rapid successes of the Germans in the first phase of World War II. They gave expression to their anti-German feelings on the Czechoslovak Day of Independence, Oct. 28, 1939, by demonstrating in the streets of Prague, which, on that day, were to be sprinkled with Czech blood for the

first time. Not long after this, on the occasion of the funeral of Jan Opletal, a medical student who had been wounded on Independence day, the students staged an anti-German street demonstration which supplied the occupying force with its reason for severe reprisals. These included the closing down of all Czech universities on Nov. 17, 1939, the execution of 9 student functionaries of student clubs, the placing of 1,500 students in German concentration camps and the proclamation of martial law in Prague, Beroun, Hořovice and Kladno. On Dec. 12 it dissolved the Prague municipal authority, arresting in the middle of the following year the former mayor of Prague, Dr. Otokar Klapka; on Aug. 6, 1940, it suppressed the National Solidarity in the Prague district and at the beginning of November it dissolved all Boy Scout organizations. In the spring of 1941 it sealed down all the Sokol gymnastic centres. None of these measures, however, could change the determination of the Czech men and women or stop the work of the resistance movement at home. That is why the occupying power decided in the autumn of 1941 on a more drastic step. On Sept. 27, 1941, Hitler sent to Prague Heinrich Himmler's lieutenant, Reinhard Heydrich, Gestapo chief, who assumed the function of deputy reich protector. He introduced himself by ordering the arrest and execution of the prime minister of the protectorate government, Gen. Alois Eliás, the shooting of Dr. Klapka and, with him, of scores of Czech patriots-generals, Sokol leaders, intellectuals, clerks and intrepid leaders of the Czech resistance movement from all the strata of the nation. With the ever-rising reign of terror, which claimed for its victims on Oct. 1, 1941, the entire Sokol community that had been by then totally disbanded as an organization, there went hand in hand greater efforts than ever to win the Czech people for the German cause. Thus, Heydrich and Frank on Jan 19, 1942, carried out a reshuffle of the protectorate government by making Jaroslav Krejči its head and Moravec its minister of education and culture. Walter Bertsch, a German, was placed in charge of the compulsory enrolment of Czechs for work in the reich, holding an official position in the protectorate ministry of labour and social protection.

On May 27, 1942, an attempt was made on Heydrich's life, causing his death on June 4. Kurt Daluege, his successor, and Frank replied to the assassination by staging terrible reprisals. On June 10 they ordered Lidice, a Czech mining village, to be razed, meting out the same fate to a small hamlet, Ležáky, on June 24. Between these two dates and for a long time afterwards there was not a day on which nazi execution squads did not kill dozens of the nation's best people.

By the latter part of 1943, the situation at the fronts had begun to change. The occupying power in the protectorate, represented from August 20, 1943, by the new protector, Wilhelm Frick, and Karl Frank, newly created minister of state, needed Czech workers for the reich and proclaimed a total labour mobilization. The response was sabotage and the forming of partisan bands which began to gather in the Bezkydy hills country and the wooded districts of Bohemia. Attempts to frighten the Czechs with the "Bolshevik bogey" met with no success.

At the beginning of April 1944 it was reported that soviet armies, including Czechoslovak army units, had reached the frontier of Subcarpathian Ruthenia. The time had at last come for the Czechoslovak resistance forces, till then working underground, to come out into the ópen and join forces with the resistance movement abroad.

Czechoslovak Government Abroad.-Czechoslovak resistance abroad, meanwhile, had passed through similar ascending stages of development after the spring of 1939. Its first public manifestation was a protest sent to President Roosevelt by the president of the first republic, Dr. Benes, who was at that time a professor lecturing at the University of Chicago, immediately after the German entry into the Czech lands, declaring that the Czechs and the Slovaks would never accept the unbearable suppression of their sacred rights, and that they would never cease fighting for them, appealing to the government of the United States to withhold its recognition from the occupation. That protest, which was also sent to the heads of the British and French governments, to the commissar for foreign affairs, Maxim Maximovitch Litvinov, and the council of the League of Nations, proved an incentive for a rising of Czechoslovak people all over the globe as well as for the assembling and preparation of Czechoslovak military forces. In France, the way was cleared in April 1939 for Czechoslovak officers and men to join the French army, while in Poland a Czechoslovak military group was constituted in Cracow. It was only after the outbreak of the German-Polish war that military and diplomatic action enabled Czechoslovakia to be aligned with the powers who were at war with nazi Germany. On Sept. 3, 1939, the president of the Polish republic issued a decree concerning the formation of a Czech and Slovak legion, which shared in the fighting against the Germans on Polish soil. On Oct. 2, 1939, an agreement was signed concerning the reconstitution of the Czechoslovak army in France. In the diplomatic field, Czechoslovakia ranged itself alongside the Allies by the telegrams which President Benes sent to Neville Chamberlain, Edouard Daladier and Gen. Felicjan Slawoj-Skladkowski. They contained the declaration that Czechoslovakia was at war with the military forces of Germany and that it would stand shoulder to shoulder with the Allies until final victory was achieved and its homeland free once more. Czechoslovakia set up its political organization abroad in the first place by the formation of a Czechoslovak national committee in Paris. The committee was recognized by the British government on Dec. 20, 1939, as representative of the Czechoslovak people and qualified to arrange on the soil of the United Kingdom all that was necessary for the reconstitution of the Czechoslovak army in France. That reconstituted army, composed of volunteers residing abroad and, in particular, of officers and men who had contrived to slip out of Czechoslovakia, had already passed its war tests on the French battlefields.

After the conclusion of the Franco-German armistice, all the Czechoslovak armed forces were transported to Great Britain, which became their host and organizer, giving at the same time shelter and aid to the provisional Czechoslovak government, which, at the beginning of 1940, was set up in London. Dr. Beneš notified the British foreign secretary on July 9 of the constitution of a provisional Czechoslovak state administration composed of the president, a government headed by Dr. Jan Srámek and a state council. Recognition of the Czechoslovak provisional government on the part of the British government was accorded as early as July 21, 1940. The president and the 12 members of his government, in which Jan G. Masaryk became minister of foreign affairs and Gen. Sergej Ingr minister of national defense, had to concern themselves mainly with four categories of tasks. These were: (1) to look after the steadily growing Czechoslovak army and to direct its employment side by side with the Allied countries; (2) to take care of the interests of the Czechoslovak nation and the Czechoslovak republic by the building up and development of diplomatic and political relations with Allied countries; (3) to keep in contact with the Czech and Slovak people waging a desperate war against the German occupants under the hardest imaginable conditions; (4) to prepare systematically for the new political and economic life of the nation and state after the German defeat and the liberation of the Czech lands and of Slovakia.

As early as July 18, 1941, the government of the soviet union gave its consent to the formation of Czechoslovak military units on soviet soil, and on Dec. 12, 1943, during the visit of Pres. Dr. Benes to Moscow, a pact of friendship and postwar collaboration was concluded with the U.S.S.R. On July 30, 1941, President Roosevelt informed President Benes of the decision on the part of the United States government to appoint an envoy extraordinary to the Czechoslovak government in London; Anthony Eden, the British foreign secretary, in his letter to Jan Masaryk on Aug. 5, 1942, announced that the British government deemed itself absolved of any obligations under the Munich agreement which the Germans themselves had destroyed; the Munich agreements were also rejected by the French national committee in a letter from Gen. Charles de Gaulle to Prime Minister Šrámek, dated Sept. 29, 1942. On Sept. 22, 1944, in a joint declaration, the Czechoslovak government and the provisional French government reaffirmed their traditional policy of friendship and alliance with each other, and the Italian government, ruling after the downfall of the fascist regime, proclaimed as invalid, on Sept. 26, 1944, both the Munich agreement and the Vienna award of Galeazzo Ciano and Joachim von Ribbentrop, by which a part of Slovakia had been torn away from the republic.

Liberation.—On Oct. 18, 1944, the soviet army, with Czechoslovak formations in its ranks, penetrated for the first time into the territory of the republic through Užok

Eduard Beneš (foreground), being welcomed during a visit to the city of Pilsen (Plzeň). He ended a seven year exile when he reentered Czechoslovakia on April 3, 1945, to head a provisional

Czechoslovakia: Statistical Data

and Jasina. Subsequently it advanced with gathering speed across Subcarpathian Ruthenia into Slovakia, Moravia, and, finally, into Bohemia. From the west, meanwhile, U.S. and British armies penetrated through Germany to the Czechoslovak border and into western Bohemia. In the wake of the armies followed Czechoslovak civilian administrators. In the middle of Feb. 1945 President Beneš announced his departure for Moscow and from there to Košice, where he arrived on April 3. There a new Czechoslovak government was formed, combining the western and eastern parts of the Czechoslovak resistance movement and formulating the principles of government for a new Czechoslovakia. On May 5, 1945, Prague rose in arms against the German occupants, finding them prepared for a desperate, destructive last stand. Authority in Prague was taken in hand by the revolutionary national council, whose fight ended victoriously with the assistance of the

Red army. Prague welcomed on May 10, 1945, the members of the government headed by Prime Minister Zdeněk Fierlinger, and on May 16 prepared a tumultuous reception for President Beneš. (J. G. Mk.)

Czechoslovakia After Liberation.—The new Czechoslovakia had to cede its eastern province of Carpatho-Ukraine to the U.S.S.R.; minority rights were abolished and the German minority, the Sudeten Germans, numbering more than 3,000,000, were forcibly removed from the country and expelled into Germany; a new relationship between the Czechs and the Slovaks was sought which granted Slovakia a larger autonomy; the Communist party became the strongest single party in the new state and Czechoslovakia's foreign policy which formerly had been oriented toward France was now aligned with that of the U.S.S.R. On Oct. 24, 1945, all large industrial corporations and all natural resources, public utilities, transport, commercial banks and insurance companies became state property.

On Oct. 28, 1945, the Czechoslovak provisional national assembly met. It consisted of 300 members, 200 Czechs and 100 Slovaks, appointed by the four authorized parties, the Communists, the Social Democrats, the Nationalist Socialists (Dr. Beneš's party), and the Catholic Peoples' party. No other parties were allowed in Czechoslovakia.

General elections were held on May 26, 1946. In these the Communists gained 114 seats (21 in Slovakia), the Social Democrats 39 seats (2 in Slovakia), the Nationalist Socialist 55, the Catholic Peoples' party 46, the Slovak Democrats—corresponding to the Catholic Peoples' party—43, and the Slovak Freedom party—corresponding to the

Dafoe, Allan Roy

Dr. Dafoe (1883-1943), Canadian physician, was born May 29, 1883, at Madoc, Ont., the son of a country doctor. He took his degree in medicine at the University of Toronto in 1907 and practised in several Canadian mining towns before settling in Callander, an Ontario lumbering community. On the morning of May 28, 1934, he was called to the farmhouse of Oliva Dionne, a French Canadian farmer, to attend a childbirth. In the space of an hour, Dr. Dafoe delivered five baby girls to Mme. Dionne. Convinced that the infants could not live, he baptized them separately. The children, however, did survive, and then Dr. Dafoe realized that in delivering quintuplets, he had made medical history. He became legal guardian of the five Dionne babies, but resigned in 1999 because of friction with the parents of the children. Thereafter, Dr. Dafoe devoted most of his time to the children in his capacity as a personal physician. He became nearly as famous as his protégées, and his life was fictionalized in motion pictures. He died at North Bay, Ont., June 2, 1943.

Dairy Industry, Bureau of

See AGRICULTURAL RESEARCH ADMINISTRATION.

Dairying

World dairy production was at a high level in 1937 and was stimulated by the outbreak of World War II. Losses of dairy cattle began in Europe as countries were overrun by armies and continued until 1946. Total cattle numbers from the prewar average of 1936–40 declined about 12% in Europe, 7% in Asia and 22% in the U.S.S.R. A large part consisted of dairy animals, since nearly all cows are milked in Europe. On the other hand, there was a big increase in South America, New Zealand and South Africa. The dairy production of Europe recovered slowly in 1946. Denmark alone was able to meet domestic needs and supply small quantities for export. New Zealand and Australia were not able to equal their prewar exports.

In the United States, the dairy industry on farms was starting on an upward cycle in 1937 after a decline that had continued from 1934. Production per cow also began an increase in 1937 which lasted until 1942. For 70 years the period 1934–38 was the only one in which the number of cows had not steadily increased. These factors placed the productive dairy industry in a position to make the remarkable expansion needed in World War II.

The number of milk cows on U.S. farms was estimated by the U.S. department of agriculture at 24,649,000 head on Jan. 1, 1937 and increased steadily to 27,674,000 head in 1945, when a slight drop was recorded to 26,785,000 head on Jan. 1, 1946. In 1939 the number of heifers saved by dairymen for milk cows reached 5,800,000, a number

Number of Milk Cows in the U.S., 1937-46 (On Jan. 1)

									,						
									24,649,000	1942					26,398,000
									24,466,000						27,106,000
									24,600,000						27,655,000
									24,926,000						27,674,000
1741	٠	٠	•	•	•	٠	•	•	25,478,000	1940					26,785,000

much larger than was needed for normal replacements, indicating the plans of dairymen to expand to meet an expected war demand for milk. During 1940 the number of cows increased by more than 300,000 head. In Sept. 1941, the U.S. secretary of agriculture called for a further increase in milk production to provide supplies for lend-lease. Full feeding and extra milking was suggested as means to increase production in addition to enlarging herds by keeping more heifers.

U.S. milk production responded to the increase in the number of cows and to better feeding and care. From a total of about 103,000,000,000 lb. in 1937, the total grew steadily to the record high of 122,066,000,000 lb. in 1942, then declined a little in 1943 and 1944 before climbing to a new record of 123,000,000,000 lb. in 1945. Of these totals, about 2,826,000,000 lb. was estimated to have been produced by cows not on farms as measured by the census.

The uses of milk in the U.S. changed during the war period as the need shifted. Before the war, about 32,000,-000,000 lb. was used as fluid milk or cream; 36,000,000,000 lb. for creamery butter; and 7,000,000,000 lb. for cheese and only about 162,000,000 lb. for dry milk. By 1944, the amount used as whole milk had increased to 44,000,000,-000 lb.; creamery butter had shrunk to 29,900,000,000 lb.; cheese had increased to 10,100,000,000 lb. and dry milk was taking nearly 1,500,000,000 lb. Butter production declined by regulation to allow dry milk and cheese to be made for the U.S. armed forces and lend-lease requirements. Fluid milk consumption grew steadily throughout the decade. Per capita fluid milk and cream consumption increased from an average of 340 lb. during the period 1935-39 to 450 lb. in 1946. At the same time, per capita butter consumption dropped from about 16 lb. to 12 lb. A shift in the method of marketing also took place in that a greater proportion of the milk was sold as whole milk instead of as cream.

The U.S. dairymen faced serious difficulties during the war period because of advanced cost of feed and higher wages and scarcity of labour. High protein feeds advanced steadily during the decade 1937–46, levelling out from 1943–46. The average returns for milk rose from \$1.92 per 100 lb. in 1937 to \$3.02 in 1944 and through 1945 and 1946.

Price support measures were introduced by the U.S. government in 1941 in the form of minimum prices, which remained in effect until the end of 1944. Minimum prices of milk and butterfat were announced under the Steagall act in 1941 providing that prices were to be supported at not less than 85% of parity, later, in 1942, advanced to 90%. In Oct. 1943, dairy production or feed payments were begun to offset increased costs without increasing the retail price to consumers. Ceilings were placed on feed grains. In 13 large cities the government bought and resold fluid milk and paid the loss from increased producers' prices without a corresponding increased price to consumers. The total cost of these subsidies in 1945 was about \$602,000,000,000, of which \$500,000,000 was in the form of production payments direct to dairymen.

The value of U.S. milk cows averaged \$54.30 per head in 1935-39 and advanced steadily to \$126.00 in the spring of 1946. Good heifers were even more advanced in price. The gross farm income from dairy products sold and used on the farm increased from \$1,930,985,000 in 1937 to \$3,526,697,000 in 1944. This compares with a total of \$11,186,000,000 for all livestock and livestock products and a total of \$8,604,000,000 for all crops. Dairying remained the principal agricultural industry in the U.S. (See also BUTTER; CATTLE; CHEESE; EGGS; MILK.) (J. C. MS.)

Daladier, Edouard

Daladier (1884-), French politician, was born June 18, 1884, at Carpentras, son of a poor baker. Scholarships aided his education. After graduation from the Ecole Normale Supérieure in Paris, he taught history. In World War I he was promoted from corporal to captain of infantry. In 1919 he was elected deputy for the department of Vaucluse as a Radical-Socialist; he was continuously reelected until 1940. In 1924 he became minister of colonies and served various governments, assuming the portfolios of war, public education, public works, foreign affairs and national defense. In 1933 as premier of France he formed a ministry which lasted ten months; his second, in 1934, was defeated after a few days over the Stavisky scandal. In April 1938 he formed a third ministry and took part in the Munich conference; his ministry was reorganized Sept. 13, 1939, as a war cabinet, which fell March 20, 1940. After the fall of France he was arrested and tried for war guilt at Riom in 1942; he was imprisoned in France and Germany. In 1945 he testified against Marshal Henri Philippe Pétain, charging plots with nazis dating to 1934. Daladier was elected to the constituent assembly June 2, 1946. Challenged on his war record, he was seated July 19 by a vote of 311 to 132.

Dalton, Hugh

), British politician, was born Aug. Dalton (1887-26, 1887, at Neath, Glamorganshire, Wales, the son of a cleric who had tutored King George V. Educated at Eton, King's college, Cambridge, and the London School of Economics, he passed bar examinations in 1914 but joined the army, serving in France and Italy. After World War I he joined the Labour party and was elected to commons for the Peckham division. He was parliamentary undersecretary of the foreign office, 1929-31, under Prime Minister James Ramsay MacDonald but was defeated in 1931. Returned in 1935, he became minister of economic warfare in Winston Churchill's coalition cabinet of 1940 and president of the board of trade in 1942. On July 27, 1945, he was named chancellor of the exchequer by Prime Minister Clement Attlee. In 1946 he presented a budget estimating receipts at £3,193,000,000 (\$12,772,000,000), less than 3% below those of 1945–46, and expenditures of £3,837,000,000 (\$15,348,000,000), a decrease of 31%. He proposed to repeal the 60% excess profits tax and to raise the earned income allowance from 10 to 121/2%. On Oct. 3, 1946, he was elected chairman of the board of both the World bank and the International Monetary fund, succeeding U.S. Treasury Secy. John W. Snyder.

Damaskinos

Archbishop Damaskinos (1889?—), Greek prelate and statesman, was born Dimetrios Papandreou in 1889 at Dobritza in Thessaly, Greece. He studied law and theology at the University of Athens, served in the Greek army as a

private during the Balkan wars in 1912 and took his holy vows as a priest in the Greek Orthodox Church in 1917. Four years later (1921) he was appointed bishop of Corinth. Later he was raised to the rank of a metropolitan. In 1938 his election as archbishop of Athens and all Greece was voided by Premier Metaxas, who appointed Bishop Chrysanthos of Trebizond to the post. Damaskinos went to reside in a monastery until 1941, when he was recalled by the Holy Synod to replace Bishop Chrysanthos who had refused to swear in the pro-axis premier, George Tsolakoglu. Damaskinos, however, opposed German policy and went so far as to urge orthodox Greeks to conceal Jews to prevent them from falling into nazi hands.

In late 1944 during the civil war between royalists and leftists in Greece, Archbishop Damaskinos was selected, maiffly through the efforts of Winston Churchill, to serve as regent of Greece. In the following 16 months the archbishop appointed no fewer than five premiers in an effort to solve the political crisis, and even formed an interim cabinet himself in Oct. 1945. After the Royalists won the national elections of March 31, 1946, Constantin Tsaldaris became premier and Archbishop Damaskinos offered his resignation. But following an appeal from Ernest Bevin, British foreign secretary, the archbishop decided to remain as regent. Four days after the plebiscite of Sept. 1, which formally returned the monarchy, he resigned as regent (Sept. 5, 1946).

Dams

During the early part of the period 1937–46, an increased undertaking of vast public works programs by governments throughout the world involved the construction of a great many dams for flood control, irrigation, navigation, power and water supply.

In the latter half of the ten-year period, military requirements led to the stopping or slowing down on a number of dams not needed or less essential in production of war materials. Construction on other dams was continued and expedited where they were needed for power and food production or for increased water supply for expanded industrial centres.

Because of the attitude on the part of many national governments that river development should be carried out on a regional basis, dams of tremendous magnitude were built during the period. Multi-purpose developments were undertaken by these national governments, much larger in scope than those ordinarily undertaken by local groups who were not interested or did not find it advantageous to co-operate in constructing the extensive combined developments. The great financial resources and broad interests of the national governments resulted in large reservoirs, requiring large dams, to permit storage of flood waters for the various combined purposes of irrigation, navigation, power, water supply and reducing the damages caused by floods.

The largest dams completed during the period 1937-46 were built in the United States. A description of some of the most notable developments follows.

Grand Coulee.—The Grand Coulee dam on the Columbia river in the U.S., completed in 1942, was the largest masonry structure ever erected by man to that date. Its total of 9,930,000 cu.yd. of concrete was about seven times the size of the great Cheops pyramid in Egypt. The dam was more than 50% larger than Shasta dam of the Central Valley project in California, the second largest masonry structure in the world.

Grand Coulee dam was built at a point where a glacier once dammed up the river, forcing it to find a new course. Later the glacier receded and the river returned to its original bed, 600 ft. below, leaving a dry canyon 50 mi. long and 2 to 5 mi. wide, now known as Grand Coulee. The dam was built in the original river bed, creating a reservoir from which water would be pumped into another reservoir to be formed in the upper end of the now dry Grand Coulee. This second reservoir was to be created by constructing two earth and rock-fill dams across the Grand Coulee. The entire project involved lifting the water a maximum of about 370 ft. to utilize a large portion of the hydroelectric power to be generated at the Grand Coulee dam. From the second reservoir the water was to flow through approximately 250 mi. of main canal, to irrigate the fertile basin of the Columbia river in the area known as the Big Bend. It was anticipated that some 10,ooo families would find new homes on the 1,200,000 ac. irrigated by the great dam.

The dam upon completion was 550 ft. in height, with a base width of 480 ft. at its maximum section. Its total length was 4,173 ft., of which 1,650 ft. was used as a spillway. The spillway was capable of passing a flood of 1,000,000 cu.ft. per second, which would create a fall of water five times the average flow of Niagara falls and three times as high.

The tremendous size of the dam required that it be built in individual vertical blocks about 50 ft. square, rather than as one solid mass. Cooling water was circulated through 2,200 mi. of one-inch tubing, buried in the concrete, to dissipate the heat generated by the hydration of the cement. Assisting materially in flood control and river regulation, Grand Coulee dam had a storage capacity of 9,517,000 ac.-ft.

Ultimately, nine generators were to be housed in each of the two power plants at the dam, with a total capacity of 2,550,000 h.p. expected to produce more than 8,100,000,000 kw.hr. of firm power annually. The energy from six of the generators in the plant on the west side of the river was to be used for pumping. The remainder was to be sold to the market which was expected to develop when the irrigated land came into use.

Shasta.—Completed in 1945, Shasta dam on the Sacramento river in California was the second highest dam in the world at the time of completion, second only to Boulder dam. It was also second only to Grand Coulee dam in size.

The construction of the dam required about seven years. In addition to the more than 6,000,000 cu.yd. of concrete required for the dam itself, several major undertakings were necessary in preparation for the construction. The relocation of 30 mi. of the Southern Pacific railroad involved nearly 5,000,000 cu.yd. of grading. Excavation for the foundation of the dam involved another 4,000,000 cu.yd. A belt-conveyor system was built to transport sand and gravel for the concrete 9½ mi. to the dam site. A 460 ft. high steel tower was built, from the top of which seven cableways radiated to deliver concrete to all parts of the dam. In the spring of 1940 the worst flood of record occurred on the Sacramento river, severely damaging the bridges for the belt conveyor, access road and railroad relocation and delaying the work.

The dam was constructed as part of the Central Valley project, to provide about 4,500,000 ac.-ft. of storage for flood control, irrigation and power. Ultimately 379,000 kw. of power would be developed.

Fort Peck.—The largest dam in the world, Fort Peck, begun in 1934 and requiring six years for completion, was built on the Missouri river in Montana. Constructed for purposes of flood control, navigation improvement and power development, it had a maximum height of 242 ft., a crest length of 9,000 ft. and contained 109,000,000 cu.yd. of hydraulic-placed earth fill. Four large dredges were built at the dam to dredge material from the valley bottom and pump it into place on the dam through large steel pipe lines.

The pipes were 28 in. in diameter, and were five mi. long at certain stages of construction.

On Sept. 22, 1938, with more than 95% of the fill completed, a slide occurred in the upstream face of the dam near the east abutment, involving approximately 5,000,000 cu.yd. of fill. Investigations indicated that the weathered shale and bentonite seams in the foundation were too weak to hold up under the tremendous shearing force exerted by the dam. The damaged portion was entirely removed and rebuilt with a flattened upstream slope, causing a delay of more than a year in the final completion of the structure.

The reservoir created by the dam was to store 19,412,000 ac.-ft. of water, exceeded only by Lake Mead, the storage reservoir created by Boulder dam, with more than 31,141,-755 ac.-ft.; 105,000 kw. of power would be developed.

Tennessee Valley.—One of the most extensive river development programs ever undertaken, that of the Tennessee river, was practically completed during the ten year period 1937–46. Eight large dams and several of moderate size were built during this period, adding more than 15,000,000 ac.-ft. of storage for controlling floods and developing more than 1,400,000 kw. of additional hydroelectric power. The construction of the dams created a continuous 9-ft. deep navigation channel from Knoxville, Tenn., to the river mouth.

Many other large dams were constructed in the U.S. during this period, some of which are listed in the accompanying table.

British Dams.—One of the largest earth-fill dams in the British Isles, Ladybower dam at Bamford, England, was officially dedicated Sept. 25, 1945, by King George VI. The 137 ft. high dam was constructed for the Derwent valley water board to supply Nottingham, Leicester and several other towns of Derbyshire. Its storage capacity was 6,300,000,000 gal.

The Shingmun dam, highest dam in the British empire, was completed early in 1937 at Hong Kong. Earthquake danger, high cost of concrete material and cheap labour dictated the construction of a unique type of hand-laid rock fill. The 285 ft. high dam consisted of an impermeable upstream panel mounted on a heavy thrust block, backed up by the rock fill and having a thin wedge of sand in between to equalize the pressure as the rock fill settles.

The Vaalbank dam of the Vaal-Hartz project, largest irrigation scheme in South Africa, was completed in 1938. The Kalkfontein dam, second largest in South Africa, was completed in 1940. It was built on the Riet river, 113 ft. high, 1,040 ft. long and contained 270,000 cu.yd. of rock fill.

The Emerson barrage, largest of its type in the Punjab, was completed in March 1939; 3,025 ft. long, it contained more than 800,000 cu.yd. of masonry and was to provide irrigation for nearly 1,000,000 acres.

The Pegu-Yomas dam in Burma was completed in 1940, to supply water for the city of Rangoon. It was notable for its reinforced concrete core wall designed to withstand earthquakes.

Egypt, Mexico, France.—On the White Nile in Egypt, the Gebel Aulia dam was completed in April 1937, to provide additional storage of flood waters for irrigation purposes. The dam, a combined rubble masonry gravity section and clay embankment, was 16,404 ft. long and about 45 ft. high, containing 512,400 cu.yd. of rubble masonry and mass concrete and 384,500 cu.yd. of clay fill. The reservoir created by the dam was more than 200 mi. long, varied from 3 to 5 mi. in width and provided more than 100,000,000,000,000 cu.ft. of storage capacity.

Also on the Nile river, 410 mi. below the Aswan dam, the raising of the Assiut barrage was completed in July 1938. This dam, originally built in 1902 at the same time as the Aswan dam, was built to supply water to the 250 mi.

long Ibrahimia canal, largest irrigation canal in Egypt. It was about 2,600 ft. long and was originally about 52 ft. high. Raising the dam about 13 ft. was undertaken to deliver more water to the canal, taking advantage of the additional storage created by the Gebel Aulia dam. Raising the dam involved the placing of about 175,000 cu.yd. of rubble masonry, mass concrete and concrete blocks.

The Mexican National Commission of Irrigation undertook the construction of ten dams for purposes of irrigation and power development.

Of these, three had been completed at the end of the decade 1937-46.

In France, construction of Europe's largest dam, the Genissiat on the Rhone river, was undertaken in 1939. The 330 ft. high structure bore a great resemblance, on a somewhat smaller scale, to the arrangement of Boulder dam in the U.S. The power house at Genissiat was placed across

the river at the base of the dam, instead of parallel to the river along the base of the canyon walls, as at Boulder.

Design and Construction.—There were notable advances during the ten-year period 1937–46 in the science of building dams. With the increase in number of concrete dams of great height and mass, more attention was given to the analysis of the stresses in the concrete, and the control of the quality of the concrete.

In order to reduce the cracking caused by temperature changes in the large masses of concrete with consequent leakage and uncertainty of stress distribution, special cements were developed and cooling water was used more extensively. These measures served to reduce the temperatures generated in the mass concrete by the hydration of the cement during the setting process.

The development and application of the theories of soil mechanics to the design and construction of earth dams was greatly extended during the ten-year period. Methods of analysis of soil characteristics were developed to supplement the judgment of the engineer, upon whom great reliance must be placed for the suitability of the materials and the safety of the dam. The highest earth dams ever built were completed during the decade.

Improvements in construction technique reduced the cost of large dams and speeded up the time required to build these great projects. These improvements made possible construction of dams which under less economical methods of construction could never have been built.

In constructing concrete dams, the use of cableways was common in transporting concrete from the mixing plant to the dam. Belt conveyors were used to transport aggregate materials considerable distances—9½ mi. at the Shasta dam site. In constructing earth dams, methods for transporting and compacting the earth materials reduced the cost to as low as 20 cents per cu.yd. at some dams. Large tractor-trailer units were developed capable of hauling 20 cu.yd. Belt conveyors were also used. The use of sheepsfoot rollers became common practice for compacting the earth in the dam after placement.

The two largest dams in the world, Fort Peck and Kingsley, were built during the ten-year period 1937-46 by what was probably the cheapest method of handling large quantities of earth materials. The earth was dredged from the floor of the valley and pumped through large pipes into a pool on the dam where it settled out to form the embankment.

Dams in World War II.—World War II brought about two developments in relation to dams. First, elaborate measures were taken to guard these structures against sabotage, because of the importance of dams in the production of power, in the supply of water to the population and to industry, and in the protection of the population and industry along river valleys from floods. Second, for the same reasons, military measures were prepared to attempt to destroy some of the dams of axis powers.

On May 17, 1943, the royal air force attacked and severely damaged the Möhne, Sorpe and Eder dams in Germany, releasing at least 75% of the stored water and causing the most severe floods on record in the Ruhr valley and along the Rhine river below Duisburg-Ruhrort. Several 1,500 lb. mines were dropped against the upstream face of the dams from planes flying at altitudes of less than 100 ft. Together, the Möhne and Sorpe dams controlled almost three-fourths of the Ruhr river watershed and about two-thirds of the water storage in the industrial area of the Ruhr. The Eder dam controlled the flow of the Weser

river for navigation and flood protection.

Besides the damage caused by the flooding of industrial plants and the sweeping away of bridges and railway embankments, the loss of this tremendous amount of storage seriously affected some 300 waterworks and pumping stations, extensive canal systems for navigation and many hydroelectric plants, the backbone of this great industrial region of Germany.

An Allied air force also bombed the control gates of a dam on the Pescara river in Italy on May 5, 1944, flooding German positions on the Adriatic coast and cutting off their power supply.

The Dnieprostroi dam on the Dnieper river, greatest hydroelectric development in Russia, was partially destroyed by the Russians in 1941 in an effort to thwart the advance of the German armies and to prevent its use by the Germans. The Germans, however, made partial use of the station until 1943, when they did further damage as they withdrew. Reconstruction was commenced by the Russians in 1944. By early summer of 1946 the dam was fully restored. The dam, a 110 ft. high, 2,500 ft. long curved spillway of gravity section, was originally completed in 1932.

The development was built under the supervision of engineers from the U.S., and the nine turbines and generators were built in the U.S. The original plant had a capacity of 746,000 hp. and developed 3,000,000,000 kw.hr. annually.

The table on p. 71 gives data on some of the more important dams completed during the ten-year period 1937-46. (See also AQUEDUCTS; IRRIGATION; TENNESSEE VALLEY AUTHORITY; WATER POWER.)

Dance

The beginning of the decade 1937-46 found European governments subsidizing dancing in state ballets in Austria, Denmark, Poland, Russia and Lithuania. In Russia, the imperial ballet system was in full sway with its state-owned schools producing excellent dancers, and its famous Bolshoi theatre presenting classical ballets, old and new. However, experiments were going on, but without disturbing the traditional ballet.

In England, the Ballets Russes with Léonide Massine as maître de ballet gave their usual season at the Royal Opera house, Covent Garden. They also presented brilliant revivals of Michel Fokine's Petrouchka and Scheherazade, supervised by Fokine himself. However, English ballet was showing real progress in establishing its own dancers and choreographers. Sadler's Wells company, only five years old, won international acclaim with its ballet, Checkmate, to music by Arthur Bliss and choreography by Ninette de Valois. Its theme was a chess board duel between love and death. In the satiric vein was Wedding Bouquet by Lord Berners and Frederick Ashton with words by Gertrude Stein. The result was spicy fun poking at Edwardian manners and proof that the ballet was being influenced not only by modern ideas, but by local themes.

In France, Serge Lifar held the spotlight in the conventional ballet circles. René Blum was financing a new ballet company with distinguished young dancers, many of them trained in France by famous Russian refugee dancers and teachers. Fokine was choreographing the new ballets

In Germany, the nazi had the dance in school, concert hall and theatre meticulously regimented to fit a prescribed form more or less the work of Rudolph von Laban. Mary Wigman, who was the product of the von Laban school and one of the outstanding dance artists of Germany, was subsidized by the German republic and later taken over by the nazis. However, there arose a political conflict within the dance ranks and Wigman, always the serious artist and never the politician, fell out with the machinators and suffered under this tyranny. She finally left Dresden, her house, school and everything belonging to her, went off by herself and founded a tiny school in Leipzig among the ruins.

Even in the U.S. the dance had had a taste of state subsidy and control in the WPA dance project. With \$155,000 to spend on its dance project, the Dance Theatre was bogged down with politics, inefficiency, internal strife and propaganda. Famous dancers caught in the coils of depression were shunted off the project onto home relief while untrained pretenders took their fling at a dance career at the government's expense. Three undistinguished works were all that resulted before the project exploded with the dynamite of its own political intrigue. WPA funds allocated to a library project, however, bore permanent fruit. Under the leadership of Dorothy Lawton, music librarian of the 58th street Public Library in New York city, an extensive index of dance origins was compiled.

In ballet, the U.S. had become a remunerative place for European companies to spend a season. These companies were thoroughly European even to requiring U.S. artists to change to European names. However, there was a definite trend toward the modern in such ballets as David, Les Presages, Choreartium and Le Jardin Public.

Mikhail Mordkin, singlehanded, built a performing ballet company out of his American pupils and presented a distinguished performance of the entire classic ballet, Giselle, and the première of The Goldfish. It was at these performances that Viola Essen, then a mere child, made her debut as a ballerina, and Lucia Chase, backer of the Mordkin ballet, started her career as a character dancer.

Even more important in the growth of ballet, the U.S. was experimenting with local companies. Among these, Catherine Littlefield's company in Philadelphia presented such thoroughly U.S. ballets as *Barn Dance* and *Terminal*. This company also invaded Paris and London with its American company and American ballets and was a big success

Ballet Caravan, organized by Lincoln Kirstein to produce the ballets of young U.S. choreographers, was touring the U.S. from coast to coast with such Americana in ballet form as Billy the Kid, Pocahontas, Yankee Clipper and Filling Station.

While the "out of towners" were being shown U.S. ballet, the staid old stalls of the Metropolitan Opera house were still in frenzied controversy over the unorthodox offerings of the American ballet. Since the Russian, George Balanchine, was the principal choreographer, the contribution was far from 100% American. However, it helped in the good work of breaking through the old regime and made way for new ideas and reforms.

In Chicago, Ruth Page was creating and dancing such U.S. satires in dance as *Hear Ye! Hear Ye!* and *The Gold Standard*. She also invaded New York with these lively ballets. On the far west coast, William Christensen built up a San Francisco ballet group, as an extension of his Opera ballet in the San Francisco Opera company.

In the concert field, many of the dancers were still for-

eign artists, but the American Martha Graham had already begun her conquest of the states and Merle Armitage had published a deluxe volume of photographs of this high priestess of modernism. Ted Shawn had been touring with his all-men company for almost four years. He had even gone as far afield as London, England, with his performances. Humphrey-Weidman had their own little Studio Theatre of the Dance in New York. The Graffs had their little Concert Dance hall in Chicago.

The theatrical circles of this period thought of dancing as rhythmic relief only, and felt the public wasn't up to enjoying the art of dancing. The few fine dancers who had left ballet companies and the concert field to venture into the commercial theatre survived on their looks and personality, not on their mastery of the art of movement. The cinema at this time used the dance as an added attraction in musicals and extravaganzas, but no serious attempt had been made to photograph the dance for its own sake or to preserve dance values or sequences. That was yet to come.

Dance organizations throughout the world consisted chiefly of teacher groups who met to exchange dance steps, solve mutual business problems and top off with a bit of sociability. The English societies had gone furthest in setting standard and examination both in ballet and social dance. But both branches of the dance suffered as much from the sterility of overstandardization as they gained in organization and consistency. Educational circles relegated their dance training to the physical education department, where it was taught as gymnastics rather than as art.

De Basil's Companies.—In 1938, Col. W. de Basil's Ballet Russe de Monte Carlo, on its fifth U.S. tour, was suddenly torn asunder by a split that took Massine to Monte Carlo to join Blum's ballet, which was eventually to be known as the Monte Carlo Ballet Russe. De Basil dropped out of the picture temporarily, and the remainder of his company opened in London under the name of Educational ballets. This company subsequently left for Australia, where it left a nucleus which later started a local ballet company in Australia. Col. de Basil, however, joined his company in England again and took this company back to Australia and New Zealand, under the name of De Basil's Original Ballet Russe. Barred from Europe by war, he took his company to the United States for a tour and then left for Cuba. There, one of the few strikes in the history of the dance resulted in the company's being stranded all summer. Reorganized in the fall, it appeared in Canada with the added attractions of Nana Gollner, U.S. ballerina (one of the few Americans who refused to give up her American name although it cost her engagements in the early part of her career). Later, the company left for South America for the duration of the war, and toured there successfully for many seasons, appearing in 23 republics of South and Central America. In 1943, however, the company was practically disbanded again when Col. de Basil made an arrangement with the Theatre de Colon in Buenos Aires, Argentina, to become its dance director and bring with him a selected group from his company. Gollner and Paul Petroff left him at this time to join the Ballet Theatre in the United States. At the close of the decade, however, Col. de Basil jumped into the spotlight again, by joining the Dolin-Markova-Hurok combine, thus making a new company (but known as the Original Ballet Russe) that appeared at the Metropolitan Opera house and toured the United States in 1946. This new company also acquired the Marquis de 74 Cuevas and thereby the rights to some of the successful ballets produced by Ballet International.

Monte Carlo Ballet Russe.—The year 1938 found the Monte Carlo Ballet Russe headed by Massine. After a fall season at Covent Garden, this company toured the U.S. for six months. The following year war drove the company to the U.S. to give the previews planned for the London season. Salvador Dali's surrealist ballet to Richard Wagner's Venusberg music caused the greatest comment.

The following season the company made its first tour of South America. Returning to the United States, it gave outdoor performances at the Lewisohn stadium, Hollywood Bowl and opened at the Metropolitan Opera house, with the surrealist ballet Labyrinth among its premières for the fall of 1941. The following year Massine resigned from the Monte Carlo Ballet Russe to join Ballet Theatre, leaving the company in acute need of a choreographer. This gave Agnes de Mille a chance to present Rodeo, which she had been trying to sell for some time without success. Serge Denham, director of the company, decided to produce it as something new, different and thoroughly U.S. However, the Russian dancers of the company refused to dance in it. Denham, however, carried out his plans with the Americans in the company and a few of other nationalities. Rodeo not only proved a real hit but set a vogue for Americana in ballet form.

The Monte Carlo Ballet Russe in 1944 set a precedent by giving a popular priced season at the New York Civic centre in New York city with special matinees for high school girls and boys. The company continued to maintain its well-trained cast, its high classical standards and its noted esprit de corps. Alexandra Danilova remained the principal ballerina; Igor Youskevitch, first dancer until he was called to war; Frederic Franklin not only danced leading roles but also directed. The policy of the company was to develop leading dancers from its ranks, and it could boast of Maria Tallchief, Nicolas Magallanes, Nathalie Krassovska and Leon Danielian as excellent examples. Ruthanna Boris was a worthy addition to the company in 1943 from the Metropolitan Opera ballet. Doris Duke continued to give the company generous financial assistance.

The glamorous Mia Slavenska left the company to try a fling at a small company of her own. With the U.S. dancer David Thimar and three assisting dancers, she made a cross-country tour, with a program of divertissement and a streamlined ballet of *Belle Starr*, the U.S. lady bandit. It was successful for a couple of seasons. At the close of 1946 she announced the formation of a new company.

The leading choreographer for Ballet Russe de Monte Carlo after Massine left was Balanchine, although other choreographers did special assignments, for instance: Pilar Lopez did The Cuckolds' Fair, a ballet that suffered from the absence of real Spanish dancers; Igor Schwezoff directed the U.S. version of the Red Poppy in 1943; Frankie and Johnny was produced by Ruth Page and Bentley Stone in 1945; and in 1945 Todd Bolender choreographed Comedia Balletica. Ruth Page did a ballet on Edgar Allan Poe's The Bells in 1946, but it fell considerably short of its famous inspiration. At the end of 1946 the revolutionary American, Valerie Bettis, became the next choreographer to do a ballet for the Monte Carlo Ballet Russe.

Ballet Theatre.—The United States took the spotlight in 1940 by forming a ballet company which combined an array of stars including Russian, English and U.S. headliners. It was backed by Lucia Chase. The roster in-

cluded: the Russians—Fokine, Mordkin, Adolph Bolm and Bronislava Nijinska; the Americans—De Mille and Eugene Loring; Patricia Bowman, Karen Conrad, Essen, Gollner, and Annabelle Lyon, as all-American ballerinas; Antony Tudor, Anton Dolin and Andrée Howard as English artists of the dance.

Ballet Theatre opened in Jan. 1940 with a repertoire of new ballets and revivals. After a successful three-week season at the Center theatre, the company gave summer performances at the Lewisohn stadium, then joined the Chicago Opera company in the fall, and thereafter became an established ballet company.

The following season, Ballet Theatre played a short New York season and then devoted its summer to the International Dance Festival and school at Jacob's Pillow. At this point S. Hurok took over its management. It opened in Mexico, and from there played a season in New York, thereafter launching a transcontinental tour. Of the five new works presented, the most successful was Fokine's Bluebeard, a hilarious satire, cleverly choreographed and cast, featuring Dolin as Bluebeard, Irina Baronova as the seventh wife, Simon Semenoff as the magician. During the spring season in New York at the Metropolitan Opera house, Tudor's Pillar of Fire gave a clear movement picture of the murkiness of Victorian repression. The following season the company returned to Mexico city, this time as guests of the Mexican ministry of education. It was there, while at work on Helen of Troy, that Fokine died.

Ballet Theatre continued its career with New York seasons before and after its cross-country tour. It presented an assortment of revivals and new works without distinction until Argentinita in 1942 choreographed *Pictures of Goya* and danced the principal role.

At this time the exodus of ballet stars to Broadway began. Baronova, Sono Osato and Conrad from Ballet Theatre were among the first to answer the call of bigger salaries and popular acclaim. By 1944 even Alicia Markova and Dolin appeared with Ballet Theatre as guest artists only, and in 1945 danced nightly as soloists in a petite ballet which they choreographed for Billy Rose's Seven Lively Arts.

For the 1944 Ballet Theatre season, the witty Tally Ho by De Mille and the popular Fancy Free, a satire on sailors on leave, by the then unknown American, Jerome Robbins, and Argentinita's El Amor Brujo helped to enliven the season.

In 1945 Ballet Theatre carried on in the same tenor with Tudor's *Undertow*, which even out-tudored Tudor with a pathological murder story given a highly neurotic dance treatment. Robbins, Bolm and Semenoff each contributed a new ballet. In the spring, Michael Kidd's *On Stage* struck the public's fancy with a story about a young dancer's trials and tribulations.

By 1946, however, a change in the company terminated the Hurok management and announced a new policy. Its directors, now Lucia Chase and Oliver Smith with Peter Lawrence executive manager, announced that Ballet Theatre would become a resident American Ballet company with permanent headquarters and a school in which to train its artists and rehearse its ballets. It dedicated itself to developing U.S. artists and choreographers, with the plan including a European season each summer, and a year round schedule for its artists. Dolin and Markova stayed with Hurok to head a company under his aegis. By fall, this had been incorporated with the remains of Col. de Basil's Original Ballet Russe and opened at the Metropolitan Opera house,

Ballet Theatre, after an uneventful early 1946 season, left for Covent Garden, England, where it was well received. It returned to New York for a fall season, bringing Ashton's charming but unimportant ballet, Les Patineurs with an extravagant setting by Cecil Beaton, who also designed an artistic souvenir program for the company. A new ballet by Robbins, Facsimile, was a very clearly choreographed, well-danced version of the eternal triangle. Youskevitch, released from the United States navy, was the company's first classical dancer. Ballet Theatre played the Broadway theatre at the same time that Hurok's company held forth at the Metropolitan, thus costing both companies many empty seats. In due time, however, both companies left to tour the country.

Ballet Theatre finished its first decade without having again equalled its own brilliant first season. However, it had produced many ballets old and new to a ballethungry U.S. public. It had maintained an extravagant standard of costumes and decorations and given many U.S. artists opportunities in the ballet arts. It had done its part in popularizing ballet from coast to coast. Its greatest failure was its inability to establish a truly U.S. ballet company or, in fact, a consistent artistic leadership of any type.

The Littlefield ballet, back home from freshly-won laurels in Europe, replaced Ruth Page at the Chicago Opera ballet for 1938, and in 1939 became its official ballet. World War II disbanded her company by taking every one of its men. However, Miss Littlefield became one of the most popular Broadway dance producers during the war, and her choreography for the Center theatre ice show showed a promise in the first edition that was fulfilled by a consistent gain in variety and scope with each succeeding edition.

Jooss Ballet.-On its fourth U.S. tour in 1938, the Jooss ballet left a branch school in California. In 1939 the company toured the British Isles with two new ballets, A Spring Tale and Chronica, a ballet on dictators, and revived The Green Table by request. The following year Kurt Jooss and Sigurd Leeder were interned in England, but the school went on, and the company again toured the United States and South America with its leaders. At its next New York season, Agnes de Mille, as the first guest choreographer to do a ballet for the Jooss ballet, produced Drums Sound in Hackensack. The following year the company was associated with the Boston Light Opera company in its New York venture and then returned to England minus half a dozen of its dancers who chose to remain in the United States for one reason or another. In 1943 the Jooss ballet established itself in Cambridge, England, and toured the country with two new ballets as well as the old favourites. Their success continued with three new ballets the following year and the première of Hans Zullig's ballet Bosquet in 1945.

The Jooss ballet, which returned to the U.S. in the fall of 1946, surmounted its war difficulties and even outdid its previous record for new works, esprit de corps, good dancing and successful performances, despite unfavourable press criticism in New York city.

European Ballet.—The war brought near disaster to the Vic Wells company then touring the Netherlands; the company managed to escape, but most of the scenery was lost. Back in England, they toured the provinces, had a long season at Sadler's Wells and actually produced three new works. Miss de Valois also revived her satire on dictators, Barabau.

Ballet Rambert produced morale-building performances for war workers, and the Arts Theatre ballet, London

ballet and Ballet Rambert combined in the Arts Theatre club to give after lunch and tea performances in the war effort program. A new ballet company, Ballet International, produced *Everyman* with spoken words, and choreography by Mona Ingelsby. Ballet was considered so important that Ashton was given leave from the R.A.F. to produce *The Quest* for the Sadler's Wells ballet. Robert Helpmann made a dance drama out of Shakespeare's *Hamlet* and Oscar Wilde's *Dorian Gray*.

The return of peace doubled dance activity. A gala occasion was the return of Sadler's Wells to the Covent Garden after six years' absence in which the Garden was used as a dance hall. New and extended presentations of its three classics, Giselle, Sleeping Beauty and Coppelia were all received with the greatest enthusiasm. The International ballet put on the historic Masque of Comus sumptuously mounted, with Milton's poetic words as well as songs. Ballet Rambert celebrated its 20th anniversary as well as the return of peace by a first season at Covent Garden, and made a decided hit with Walter Gore's Mr. Punch. A number of light, witty and satiric ballets made their appearances, e.g., The Catch by Alan Carter; Assembly Hall and Mardi Gras by Andrée Howard; Les Sirenes by Ashton; Concerto Burlesco by Gore. Ballets Nègres came into being, scored, went on tour and returned for a second London season. The Anglo-Polish ballet toured the east and India.

In France, the German invasion took over the Paris Opera ballet among other things. Anxiety was felt for the Paris Archives of the Dance, but the close of the war found them intact. Lifar, star of the Paris Opera ballet, was censured for collaboration, but finally won his way back into favour. It wasn't long before the dance revived and two new ballet companies beside the Opera ballet were giving performances. The New Monte Carlo ballet featured Lifar and his choreography; Les Ballets des Champs Elysées proved a vital and important company from its beginning. Soon it had not only top-notch dances but the outstanding musicians and scenic artists of Paris. It toured and had two successful seasons in London. Paris Opera ballet revived with the beautiful Lycette Darsouval as prima ballerina. Balanchine was engaged as its choreographer at the end of 1946.

In Italy, La Scala, historic home of the Opera ballet, was destroyed by war but by 1946 was rebuilt and presented a new and ambitious classic ballet, La Taglioni. Wanda Sciaccaluga was the ballerina. Belgium had revived sufficiently to present an active season of dance.

Poland, with its ballet theatre, the Wielki, destroyed, opened in another theatre in the ruins of Warsaw. Leon Woicikowski was guest artist at the Opera house, but like many other artists had to do night club appearances in addition, to earn a living.

In Denmark, the war years produced a goodly crop of ballets; if not all new librettos, they were newly choreographed for the Royal theatre at Copenhagen. The ballet master was Harald Lander. Dancing leading roles were Margot Lander, Borge Ralov, Hans Brenaa, Svend Jensen, Svend Johansen, Knud Henriksen, Kirsten Ralov, Niels Larsen, Frank Schaufuss, Mona Vangessa. The ballets included a romantic waltz suite to music by Ravel; The Sorcerer's Apprentice; The Window, in which a Spanish señorita dances before a great mirror; Napoli, a version of the Lorelei myth; Land of Milk and Honey, a child's ballet; Qarrtsiluni, an Eskimo ballet; The Months of the Year; Fest Polonaise produced in honour of the 30-year

jubilee of King Christian X, and Spring, a ballet inspired by the brave fight of Norway against the nazis. However, this had to be cleverly concealed, so it was depicted as Norway struggling in the coils of winter; but the Danish people understood the symbolism. Another was a ballet fantasy based on Ludwig van Beethoven's tragic young love.

In spite of war, Russia took care of its dancers. During the siege of Leningrad they were transported to the Urals, where their training regime went on and new ballets were prepared. The dancers made frequent trips to the front to entertain the soldiers. During this period, classical ballet was featured, with fairy story librettos. Some of the leaders felt that in the severe stress of war this type of ballet was most soothing and inspiring to the people and released them for a few hours from their dark world.

At the close of the war, the Kirov theatre celebrated the 50th anniversary of the first performance of Swan Lake with an extravagantly mounted version. By this time the new Russia had made its influence felt on the classic ballet. Ballet master Lopukhov added athletic and acrobatic movements and incorporated many authentic folk dance steps into the repertoire. At the Bolshoi theatre, Lavrovsky used highly dramatic librettos such as Romeo and Juliet. Zakharov choreographed works of Honoré de Balzac and Alexander Pushkin. The themes on the whole were dance expression of social studies like The Serf, revolutionary motifs like Flames of Paris, Russian folklore like Heart of the Mountains, and fairy tales. Leading dancers were Ulanova, Natalie Dudinskaya, Chabukiani and Sergayev. Nina Anisimova became the first woman ballet mistress during the war and was noted for her exquisite choreography of Russian fairy tales.

Leaving the western world at the height of his success

Helen Tamiris and Daniel Nagrin in "Liberty Song," a ballet of 1942 based on songs of the American Revolution, with music arranged by Genevieve Pitot

with his Hindu musicians and ballet, Uday Shankar left for India to establish a school of the dance and allied arts with a generous endowment fund from a U.S. patron of the arts. Shankar began tours of his native land and composed a ballet which enacted the trials and sufferings of his people.

Short-lived U.S. Companies.—Something new in ballet came about before the end of the decade in the formation of Ballets for America, organized by Yurek Shabelevski, Yurek Lazowski and Tatiana Grantzeva. With Nana Gollner as prima ballerina and Tatiana Grantzeva, Kathryn Lee and Bettina Rosay as first soloists, plus a company of excellent dancers, the company set a precedent in doing away with the traditional corps de ballet and specializing in short ballets designed to show the talent of individual dancers. Two pianists took the place of the traditional orchestra. The company had an auspicious opening in Bridgeport, Conn., in Sept. 1946. Members included Kathryn Lee, Nana Gollner, Tatiana Grantzeva, Bettina Rosay, Halina Razoumova, Virginia Barnes, Yurek Shabelevski, Yurek Lazowski, Petroff, James Lyons and Shaun Obrien.

Ballets especially choreographed for the company were Les Arabesques (Massine), En Passant (Lazowski), The Gentleman Chooses a Bride (Romanoff) and Lola Montez (Caton). Two ballets previously composed by Massine were Les Matelots and The Strange Sarabande. Three famous Pas De Deux (from Don Quichotte, The Nutcracker and The Sleeping Beauty) supplied the traditional part of the repertory. Starting out on tour, the company seemed slated for success because it filled a demand for a popular evening of good dancing by a small well-integrated company with minimum overhead. However, its audiences were not large enough to support it, and it soon was forced to disband.

Three other short-lived ballet companies deserving mention were Loring's Dance Players, American Concert ballet, and Ballet International. The Dance Players toured for a season and went to New York in 1942; they were headed by Loring as dancer and choreographer. Lew Christensen was the first male dancer, Janet Reed ballerina. They produced Prairie and The Man from Midian by Loring; Jinx by Christensen. Loring's Duke of Sacramento was given during its summer session at New Hope, Pa. In the fall, Christensen went into the army and the company disbanded.

American Concert ballet was organized by a half dozen dancers who were working in the theatre but wanted to do creative work. The performances were given in rehearsal togs and were very worthwhile occasions. Programs included Balanchine's Concerte Barocco, William Dollar's Five Boons of Life, Mary Jane Shea's Sailor Bar and Bolender's Mother Goose Suite.

Ballet International opened in the fall of 1944 with some excellent dancers and able choreographers. A promising season followed, but the ballet went on the rocks because of mismanagement. Some of the best new ballets were taken over by De Basil Ballet Russe two years later.

Civic Ballet.—An important factor in the progress of the ballet during the decade was the group of local civic ballets that not only trained youthful aspirants but often produced ballets of freshness and importance. These groups aroused local interest in dance art and built an appreciative audience for the professional companies. In a few instances they grew into professional companies.

Typical of the latter was the San Francisco ballet, developed as an extension of the San Francisco Opera ballet. In 1937, William Christensen became the first

dancer of the city's opera group, and with the aid of the other two Christensen brothers, Harald and Lew, formed the San Francisco ballet. As time went on the company developed many leading dancers. Later, Ruby Asquith became its prima ballerina; the first male dancer was Peter Nelson. In 1939–42 and again in 1945, the company toured, sometimes as far east as Detroit and Chicago.

Local ballets in the states giving regular performances included Berenice Holmes' Chicago Ballet, Lillian Cushing's Colorado Dancers, Thelma Biracree's Rochester ballet, New Jersey's Young People's Dance theatre and Jan Veen's Dance Group of Boston.

Other notable civic ballets included the Volkoff ballet in Canada; the Washington, D.C. Civil ballet, organized and led by Lisa Gardner; Dorothy Alexander's Civil ballet in Atlanta, Ga.; the Sociedad Pro-Arte in Havana, Cuba, etc.

Summer Camps.—Another important development in the dance field was the establishment of summer camps and schools, comparable to the summer theatre in drama. These outdoor centres offered ideal training and rehearsal grounds and many gave regular performances that were enthusiastically attended by the natives and scores of tourists. Some dance performers drew audiences from hundreds of miles around.

Jacob's Pillow at Lee, Mass., was an example of this type of summer dance camp. First started by Shawn in 1933 to train his company of all men dancers, it was disbanded in 1940 because all the men were being drafted. The following summer, Dolin and Alicia Markova took over the place as a school, gave weekly performances and conducted rehearsals of Ballet Theatre. In 1941, a group of Berkshire residents formed a corporation which was chartered by the state as an educational, artistic, nonprofit institution. This group raised money to buy the 200-acre estate, built and equipped a fine dance theatre and during the following summer of 1942 conducted a school and dance festival, presenting some of the leading dance artists of the day in many different branches of the art. In spite of war, Jacob's Pillow carried on not only with its summer school but with its summer concert series. The first year of peace brought an enlarged student body including veterans studying under the G.I. Bill of Rights. The number of performances was also doubled, and plans were laid to make Jacob's Pillow a year-round school with a four-year course in the dance.

Ballet on Ice and Rollers.-If the dance paid tribute to the art of skating by celebrating its forms in the ballet Les Patineurs, skating returned the compliment by devoting a whole decade to putting dance steps and traditions on blades and rollers. Ballet was given its first popularity by the trained skater, Sonja Henie. Her appearances in motion pictures, featuring her in glamorous settings, introduced the world to the dance on blades. However, the first real ice ballet was staged in 1942 at the Center theatre in New York city by Catherine Littlefield as the choreographer of It Happens On Ice. In the successive years of this ice show Miss Littlefield progressed steadily toward her goal of putting classical ballets on ice. Autumn Leaves was her first success. The Nutcracker was the 1946 attraction. In the interim Miss Littlefield staged many original ice ballets celebrating various dance periods and styles.

Arena ice shows became more and more elaborate, with Chester Hale, dance director, bringing dance choreography to the Ice Capades; Catherine Littlefield doing the Sonja Henie show; and Mary Jane Lewis, the Ice Follies.

The official debut of the roller skating show was made

in 1942, with dance-trained Gloria Nord as the ballerina on wheels, or "rollerina," as she was called. Miss Nord attempted to preserve the soft fleet movement of the rollers, and her approach was always artistic rather than athletic. The show was an instant success.

In Toronto, Canada, the famous skating carnivals that drew crowds from all over America were joint projects of the local skating society and one of the leading ballet schools.

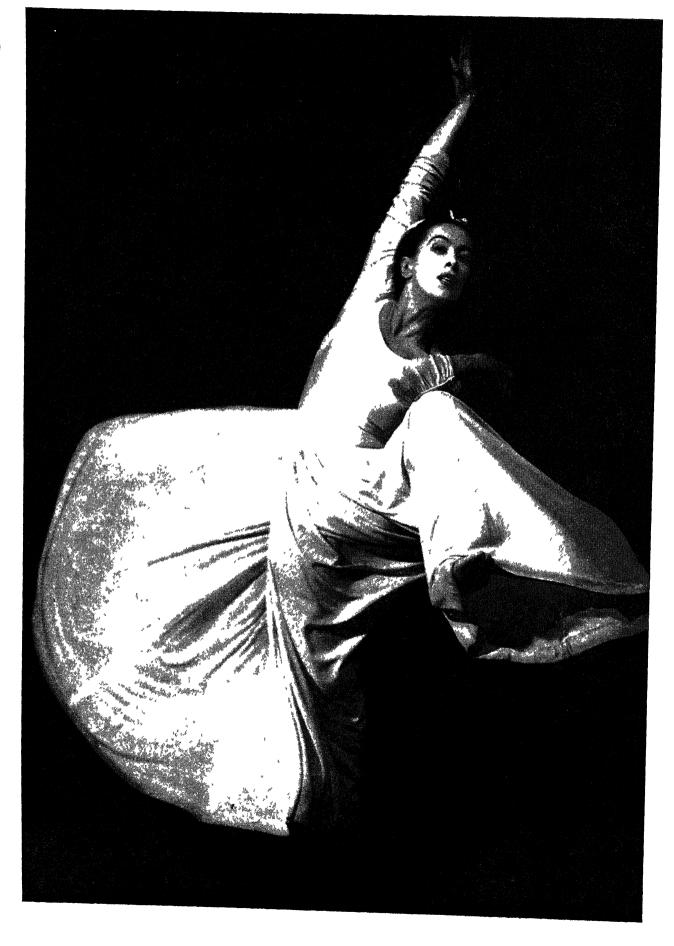

On the west coast of the United States, the San Francisco ballet company under the direction of Christensen collaborated with the ice carnival with interesting results. Also on the west coast, an interesting organization of skaters and dancers was formed to bring the arts closer together.

The movies began to feature skating attractions and built whole pictures around the art. The Czechoslovakian Vera Hruba Ralston was one, the English dancer-skater Belita another.

Modern Dance.-The so-called modern movement blossomed into worldly success during the decade 1937-46. It lost its lean and hungry look, its drab décor, and its hair shirt; it took on properties, gorgeous costumes, even some very realistic scenery. It was accompanied by orchestra, song and poetry as well as percussion. It used scarfs, flowers, hoops and maypoles as its accoutrements. It gave Broadway seasons as well as studio theatre performances and cross-country tours. Its dancers studied ethnological techniques. It founded schools, published a magazine and wrote books. It grouped around itself collaborators in music, décor and even poetry. Its librettos were taken from literature, politics, psychology, history and life. Its dancers appeared in the commercial theatre without apology, choreographed for it and saw their creations performed by the big ballet companies.

Bennington college in Vermont gave it a summer home, and later Colorado college organized the Summer School of Modern Dance. Its leading spirit continued to be Martha Graham, who produced several ambitious works each year and was commissioned to create for such memorable occasions as the Festival of Music and Dance sponsored by the Coolidge foundation. She continued to dance her own roles with a distinct style and admirable virtuosity, supported by a devout and well-trained company. Among her most successful works were: Appalachian Spring, Herodiade, Every Soul Is a Circus, Salem Shore, Death and Entrances, Dark Meadow and Serpent Heart.

The Humphrey-Weidman Studio theatre had regular seasons and guest artists. In 1936, Charles Weidman produced Quest, in 1937 Opus 51, an extensive work in pure movement. On My Mother's Side (1939) was a solo suite depicting his ancestors. Also in 1939 Doris Humphrey and Weidman together produced Decade, a ten-year history of their dance group. In 1940 they opened their own Dance Repertory theatre, a well-planned small-dance group which produced weekly programs. Within the following five years Weidman produced Flickers, a satire spoofing the silent movies and Daddy was a Fireman, a ballet telling the story of his father's rise from just plain fireman to chief. Doris Humphrey revived With My Red Fires, produced Inquest and gave an all-Bach program with José Limon as guest star. In 1945 Weidman established his own concert company and presented Dialogue, a kinetic pantomime telling the intrigue of two couples on a weekend in the country; this was televised. Goliath was a ballet based on the biblical story; A House Divided, a dance

expression of the democratic ideals of Abraham Lincoln.

Jan Veen, formerly Hans Wiener, conducted a dance group in Boston which presented, among other works, a dance dramatization of Washington Irving's *The Legend of Sleepy Hollow*. The Graffs opened a summer theatre at Fieldston, Vt., and kept their Concert Dance hall in Chicago; between seasons they toured.

The African Dance group gave a number of recitals of African ritual dances. Pearl Primus, young U.S. Negro, took these ritualistic dances with others of her own creation into a well-known night club and became a sensation. She followed with a successful season on Broadway, from there became a featured dancer of Show Boat. Margaret Wallman directed a modern dance ballet in Buenos Aires in 1940. Anna Sokolow was invited to organize the first professional modern dance group in Mexico.

Other Attractions.—One of the important dance results of World War II was the stranding of La Meri in the United States. La Meri had travelled all over the world gathering authentic costumes and dances and later giving highly educational recitals of these ethnological dances in authentic costume, accompanied by truthfully transcribed music. Unable to continue her tours after the outbreak of war, La Meri associated herself with Ruth St. Denis and founded a school of ethnological dance in New York city in 1940. By 1941 La Meri took over the whole school: by 1942 she had fortnightly programs, and by the following year she had taken larger quarters including a small dance theatre in which she gave a regular dance season. In 1944 she made a distinguished contribution in comparative dance techniques by giving a Hindu version of Swan Lake to Tschaikovsky's music. Interesting versions of other ballets followed, all done with correct ethnological techniques, e.g., Scheherazade.

In 1942 the Devi Dja, dancers of Java and Bali, were also warbound in the United States. They established headquarters in Chicago and opened an interesting night spot where they gave their authentic dances and ballets.

Edwin Strawbridge organized a company to tour the country and play to children audiences. His program each year was a dramatization of some U.S. theme e.g., America Dances, Daniel Boone, Johnny Appleseed, etc. Miriam Marmien, Angna Enters, Ivy Kitchell, Carla Goya and Marina Svetlova were irrepressible recitalists who toured the country each year.

Choreography.—Considering the growth of dance activity and the increase in the number of new ballets presented, it was surprising that the decade 1937-46 produced so few distinguished works. There were a number of classical revivals which, however interesting and valuable, could not be said to rate on the progressive side. Of the new crop of ballets in classic form, Balanchine's contributions showed innovations in enchainment and decorative group patterns. They were, on the whole, brilliant but completely academic. Of these, Ballet Imperial and Concertantes were outstanding. Madame Nijinska also carried on the classic tradition with some new and interesting formations plus fidelity to the music structure. Dollar's Constantia was probably the only real step ahead in the classical ballet. Here the choreography had fluency as well as decorative pattern. The sequences were characterized by concentrated movement, a feeling for space and a powerful emotional overtone. The pas de deux was uniquely original, decorative and expressive.

Martha Graham in "Letter to the World," a ballet of her own choreography built around the legend, rather than the life, of Emily Dickinson Satiric ballets ran the gamut from classical mythology to contemporary dictators. Fokine's Bluebeard was memorable for its deeply witty comment in dance form. The Dumb Wife, choreographed by Antonia Cobas, was delightfully original. De Mille's Three Virgins and the Devil deserved special mention as one of the earliest dance satires of the period. The Seven Heroes by Jooss was amusing, and Trudi Schoop's Comic Paper was hilarious. A Thousand Times Neigh, a satiric ballet by Ballet Caravan was used by Henry Ford to entertain the public at his concession at the New York World's Fair.

The decade also showed a tendency toward psychological ballet with a neurotic slant. Tudor excelled in this type, as in his murky Undertow. The Young Man and Death, choreographed by Roland Petit for Les Ballets des Champs Elysées, was in the same category and created a furor by having a young poet hang himself on stage. In England, Helpmann's ballet The Miracle of Gorbals, celebrating the slums of Glasgow, was a noteworthy example, as was also the English ballet The Fugitives by Andrée Howard, which was concerned with two sisters who fell in love with a fugitive. Frankie and Johnny by Ruth Page was in the same vein, but was done with less seriousness.

Of the genre ballets, Agnes de Mille's Rodeo took first place and started a whole vogue of Americana in dance form. However, Loring's Billy the Kid (1936) antedated De Mille and was danced with success for several seasons. Argentinita's Goyescas (Pictures of Goya) was noteworthy in the Spanish medium of movement.

Of the philosophical ballets, Fokine's *Paganine* rated high. Massine's somewhat decadent *Symphonic Fantastic* was important. Helpmann's *Adam Zero* was highly original in production.

Among the moderns, Martha Graham's Letter to the World, Death and Entrances and Serpent Heart set a new high as psychological drama in modern dance form. Doris Humphrey's Inquest was in the darkest possible vein, while Weidman's Daddy was a Fireman was light, human and amusing. Valeri Bettis came into prominence for her psychological dance dramas in monologue form and struck a new high in personal beauty and a new low in psychological morbidity. She was invited to do a ballet for Monte Carlo Ballet Russe in 1946. It was called Virginia Sampler.

Folk Dancing

Prior to 1937, many European countries had given periodic dance festivals celebrating the traditions of the country in a dance form; they had also compiled descriptions of dance steps and ceremonials, and established museum collections of folk crafts. This was already showing its effect on the professional forms of the dance; for instance, in Douglas Cody's ballet Folk Dance. In the United States, the Folk Festival Council of New York had organized folk dance groups of dozens of different nations and staged demonstrations and festivals in authentic costumes. The English Folk Dance society, headed by May Gadd, was busy interesting U.S. groups in the recreational value of English folk dancing.

In the ten years following 1937, the folk dance flourished in many new ways. In the depression that preceded World War II, people had been thrown more on their own resources for entertainment because they did not have surplus funds to buy it. Vacations were spent in small towns rather than at expensive resorts. The city folk danced with their country hosts and found it so

much fun that they organized folk dance groups when they returned to the city. A number of small and large folk dance festivals were inaugurated as civic and national projects.

In the United States, the folk dancing at the New York World's Fair on the American Common turned out to be one of the big attractions and introduced thousands of visitors to the joy of simple folk dances. At the close of the fair in 1940, the Folk Dance centre directed by Michael Herman was formed and continued to conduct folk dance sessions for the layman, as well as for teachers; it began publication of the magazine *The Folk Dancer* and maintained a library and information bureau.

The National Folk Festival association of America, organized by Sarah Gertrude Knatt in 1933, gave yearly festivals of increasing popularity and importance. Practically every state in the union had a folk festival society, committee or group. In 1940, the Coronado Cuarto Centennial brought thousands of visitors to Oregon and New Mexico. In that year 150 folk dance festivals were held in New Mexico alone. Lloyd Shaw at the Cheyenne Mountain school, Colorado Springs, Colo., aroused such interest in the high school boys and girls that their folk dancing society produced programs that enjoyed great success in their yearly cross country tour.

The war served as another impetus for the folk dance, not only as recreation in servicemen's centres but also for its therapeutic value in helping the disabled soldiers in convalescent hospitals and rehabilitation centres. Michael Herman prepared a special folk booklet for U.S.O. use with servicemen overseas. (L. Mh.)

Ballroom Dancing.—During the early 1930s, there had been somewhat of a lull in ballroom dancing, but from about 1935 on there was a sharp and intense increase in public interest. Popular dance tunes tumbled from the publishers' presses almost faster than they could be sold. Dancing was again mounting toward the peak of a craze. Students of the subject traced a marked similarity in ballroom dancing before each of the World Wars. In each case, about five years before the war, public taste turned toward more reckless, abandoned steps and general interest in dancing swelled, lasting throughout the war.

The fox trot type of dancing, which again became popular in the United States during 1937, influenced dancing the world over for the next ten years. During 1937, one of the earliest forms of jitterbug took hold. It was called the shag and so popular did it become that manufacturers designed shag jackets, sweaters, caps, gloves and so on. Without the shag, the Big Apple would never have become so well known, nor so long lasting.

The Big Apple was a curious phenomenon. The public first heard of it through the national news services, which reported that a new group dance was being performed in South Carolina. Arthur Murray, dance teacher, sent a representative south, but he was disappointed to discover that there was no definite, complete dance. The Big Apple meant that groups of people would gather in a circle letting one aggressive member take the place as leader. He would call out any commands that came to mind. Most callers used the customary "swing left" and "swing right," but the calls that were peculiar only to the Big Apple were "Praise Allah" and "Shine." At "Praise Allah," all of the dancers would raise their arms high in the air and, howling like banshees, would draw together in a tight knot. At the call of "Shine," a single couple would take the initiative and, going to the centre of the circle, would do their

The Lambeth walk, a dance fad of 1938, originated in England and became popular in the United States

own version of an exhibition. During each "Shine," the onlooking, circled dancers would clap hands, beat time and shout and cat-call enthusiastically.

The name Big Apple was catchy and public interest was awakened. So Murray and a talented young teacher named Thomas Gallagher worked out a Big Apple routine, naming the steps Cut That Apple, Peel That Apple, Throw Away the Core and so forth. These steps spread and the call for a "shine" became a fine chance for a couple to do a shag exhibition. The dance took hold. Exhibition troupes and leaders were hired by night clubs, hotels, roadhouses, theatres, resort hotels and cruise ships. Adults caught the fever. Whereas the Big Apple and the shag demanded the stamina of the young, older men and women fell under the spell.

By 1938 the Big Apple and the shag had spread to Europe. The tempo of shag music was quite different from the conventional fox trots of the day and the English found it impossible to dance their customary slow fox trot or their quickstep to shag music. The Scandinavians adopted it enthusiastically and called it "American Swing Dancing." In the same manner, the Scandinavians referred to all conventional fox trots as "English" dancing. Many U.S. soldiers, stationed in Italy during World War II, were astonished to find that many Italians could remember the Big Apple. The young U.S. soldiers had only a vague memory of the dance.

One of the surest signs of the growth in English dance interest during the late 1930s was the rebirth of the famous "Star Championships." These country-wide contests were originally started in 1925, sponsored by the newspaper of the same name. Almost all of the well-known dancers had been connected with the "Star Championships," yet public interest waned and the contests

had died out about 1931. In 1938, there was a new start. Professional and amateur "heats" were held all over England, with the semifinal and final competitions taking place in huge Albert hall, London. To the people of the U.S., the English taste for competition dances seemed almost unbelievable. Besides the "Star" contests, the Imperial Society of Teachers of Dancing held yearly contests for amateur dancers. These even included a junior grade classification for amateurs less than 12 years of age. In England, great emphasis was placed on correctness of footwork, posture and mechanical perfection of steps. There was no room in an English contest for imaginative or original dancing. Precedent was the strong point and prize winners had to follow the book of rules closely.

Yet, despite their conventional taste, group dances took stronger hold in England than anywhere else. In 1938 the Lambeth Walk became popular. This was danced to a tune from a popular English musical show, and the song and dance soon spread all over the world. It probably died out as quickly as it did because it depended on only one tune. The dance was done in couple formation in a circle, and any number of couples could take part. There were definite steps but they were simple to learn and repeated themselves in phrases.

The Palais Glide was another English group dance, to the tune of "Ten Pretty Girls." There was an unusual formation to this dance. Four or five couples would form a line with all members facing the same way. Then, with arms around each others' waists, they would do very simple "chorus-line-up" steps. The Palais Glide never became so popular as the Lambeth Walk and the same was true of another English group dance, Underneath the Spreading Chestnut Tree. This had a rollicking tune with the words of the chorus calling the action. Both the Palais Glide and the Chestnut Tree were danced in the United States but died out rather quickly.

During 1938 the vogue for South American dancing grew. Rumba music was played in the big cities and the samba was beginning to be introduced.

Annual Harvest Moon dancing contest in New York city, 1941. About 20,000 spectators attended the finals. The photograph shows Negro contestants performing the "boogie-woogie boost"

While the English learned to "Peel That Apple" and the people of the U.S. learned to "Walk down Lambeth Way," the French were taking up the conga. This was especially popular when done in group formation, in what was called a "conga chain." The conga music was infectious; the steps were simple and with the impetus given by the smart crowds on the Riviera, the conga soon spread. It was done all over Europe and in the U.S., too. Although the conga craze was short-lived, the dance had a revival during World War II. This probably was because of the conga's being such an easy group dance and during wartime people favour gathering in groups. Conga chains again became popular and were used at all servicemen's and officers' club dances.

Having seen the popularity of so many English group dances, Arthur Murray watched for news from London and, in 1939, heard of the Boomps-a-Daisy, also done to only one tune; but the tempo was a perennial favorite, a waltz. Murray sponsored the dance in the U.S., and it swept the nation. The Boomps-a-Daisy was far more popular in the United States than in Europe and it lived longer than any of the other group dances. Perhaps experts in human behaviour could explain this popularity. They could tell why bumping a partner's hips should be so titillating. At any rate, senators "boomped" in Washington, the dance was used at every college prom, and it was seen in the most exclusive hotels and night spots in every big city. A popular theatrical revue playing in New York had the chorus girls coax staid patrons to join them in dancing Boomps-a-Daisy up and down the aisles of the theatre. With a Hands, Knees and Boomps-a-Daisy, adults everywhere played this childish dance game.

About this same time, the "Beer Barrel Polka" became a best-seller. Many recordings were made and it was a favorite juke-box tune. Old timers remembered the polka and enjoyed the familiar hop, skip and a jump. They puffed through it and youngsters picked up the dance quickly.

Restaurateurs had discovered that an audience likes to participate in entertainment. Patrons had enjoyed entering Big Apple circles, had gleefully hung on to conga chains. Merely to sit and watch professional entertainment lacked personal excitement. And so the Champagne Hour became popular throughout the country. This was a form of contest, staged by a pair of exhibition dancers or teachers. The couple would exhibit a dance, perhaps teach a basic step, and then the man dancer would choose women as partners and the girl would dance with men guests from the audience. Then, with all of the participants in a line, the audience would judge the winners by applauding. The effect of these Champagne Hours on general ballroom dancing could not be overlooked. With a skilful professional partner to guide them, people who had not danced for years found it easy and became eager to learn the new steps. Also, these contests endured. The leading hotel in New Orleans maintained its popular Champagne Hour, as did hotels in many other cities. Other forms of audience participation also proved popular. There were "Dance Ouizzes" with the audience guessing the names of older dances such as the Bunny Hug, the Castle Walk and the Turkey Trot. These quiz games were run as a form of bingo. Cards, naming the dances, were distributed to the audience. An exhibition team would do "Dance No. 1" and the audience marked the appropriate name.

While these group dances and novelties were popular, jitterbug dancing was not forgotten. Toward the end of

1939, during the crisis of impending war, dancing became frenzied, with emphasis on the jitterbug. By 1940 rumba music began to come into its own. Many Cuban musicians had gone to the United States to popularize their national style. A great many rumba tunes were written and spread throughout the country on phonograph records, over the radio and through motion pictures. Dancers were concerned with learning a more authentic Cuban style. People who had not shown interest in dancing for years began to take lessons.

During 1940 the only new group dance was a rather graceful one, too difficult for sweeping popularity—La Varsoviana, popularly known as the Little Foot. It was an old dance, a combination of mazurka and schottische and was first revived in the southwestern part of the United States. La Varsoviana was featured and popularized in a motion picture named Arizona. During 1940 the movies placed much stress on dancing. Pictures such as Dance, Girl, Dance, Down Argentine Way and the Fred Astaire picture Second Chorus were high on the popularity list.

From 1940 on, interest in the tango dropped as swiftly as the vogue for rumba grew. Europeans and people of the U.S. called all Cuban music by the name rumba. In Cuba, however, there was a sharp differentiation. There were the slow rumbas, which the Cubans classified as bolero, cancion bolero or bolero son. The danzon, a quiet, medium tempo, was danced in a very conservative style. The danzonette—similar to the danzon—had shorter music and more life. The guajero had a slow to medium tempo. Others included the son montuno—medium with a fast ending—and the fast rumbas, the guaracha and the montuno.

Cuban dance music is easy to recognize because the instruments are distinctive. The maracas, dried gourds filled with buckshot, are shaken like rattles. The bongo is made of two small drums, fastened together and held between the knees, drummed upon with the fingers. The clavas, two pieces of hard wood about six inches long and an inch thick, give a sharp, reverberating sound when struck together.

During 1941 the conga was used as a partner dance. It demanded more floor space than jitterbug because the basic step of 1-2-3-kick was done with partners progressing away from each other. There were few popular steps to the dance and by the end of the year it was outdated. There were also a few short-lived novelty dances during 1941. A V for Victory, which was an ordinary dance number ending with couples scrambling to form a V on the floor . . . a Thumbs Up group dance, with couples in open position, following a leader who would frequently call for right or left thumbs up. There was also a Double-Partner waltz, supposedly danced in groups of three-one man and two girls. This formation was based on the premise that fewer men partners would be available during wartime. But the dance lived almost solely in newspaper and magazine pictures rather than on actual dance floors.

During 1942 the public became conscious of their social debt toward men in uniform. U.S.O. canteens were set up near every camp and naval station. There were officers' clubs, too, and the main social events for evening entertainment were the dances. Participation dances were naturally popular because they acted as "ice-breakers." Also when there were an unequal number of girls and men, the participation dances were amusing to the left-out

onlookers. The polka was still used as a novelty, and two new numbers became very popular—the Strip Polka and the Pennsylvania Polka. There was a short life, too, for a couple-dance done to "Praise the Lord and Pass the Ammunition." By 1942 the conga was used only as a participation stunt at parties. The samba, more difficult, was becoming better known and in 1943 it was displayed in a Walt Disney movie which had world-wide release.

U.S. soldiers had carried jitterbug dancing all over the world, and in Nov. 1943 *Life* magazine devoted the front cover and nine whole pages to this dance. It was hailed as "the true national folk dance of America." From about 1943 on jitterbug became sufficiently standardized for popularization among all ages. Whereas older people did not adopt the wild, acrobatic gyrations, still they jittered. The music demanded a definite jog or hop; it was impossible to dance a conventional fox trot to jive music.

The one dance that retained its popularity throughout the decade was the waltz. Each year there were at least a few new waltz tunes which become well known, and the old favorites continued to be played. Youngsters knew "Three O'Clock in the Morning" as well as their parents. It was only natural that the waltz should keep its place, as the basic waltz step was the foundation of the rumba, the samba and of the majority of fox trot steps. (A. Mu.)

Danzig

This formerly Prussian port on the Baltic sea at the mouth of the Vistula river was constituted with some surrounding communities by the treaty of Versailles in 1919 as a free city under the protection of the League of Nations, to give Poland the necessary séa outlet promised in Woodrow Wilson's fourteen points. The territory had an area of 730 sq.mi. and a population (1939), predominantly German, of 410,000, of whom 291,000 lived in the city itself.

It was the controversy over Danzig and the "Polish Corridor" which became the immediate cause of World War II. After 1933 the German National Socialist party in Danzig under the leadership of Albert Forster tried to coordinate Danzig policy and life with the system introduced in that year in Germany. By May 1938 the National Socialist party was in control of Danzig. By the end of 1938 Danzig was "gleichgeschaltet." In March 1939 Chancellor Hitler demanded the incorporation of Danzig into the German reich, in spite of his ten years' treaty of friendship with Poland signed in 1934. With the outbreak of World War II in Sept. 1939 the city was annexed by Germany.

As a result of the German defeat in World War II the city was incorporated into Poland in 1945. Prior to the war the Poles had built a new harbour at Gdynia, 12 miles

to the northwest, on Polish territory. By 1939, the new port had grown into a modern city of 120,000 population. As a result of the war, much of the old city of Danzig with its historic buildings was destroyed while the harbour remained intact. In Gdynia the harbour was destroyed while the city was largely spared.

Under the new Polish administration Danzig, called in Polish Gdansk, was to be enlarged as a great harbour which would also embrace Gdynia and Zoppot (Copot), a fashionable sea-side resort between the two ports. In 1945 practically all removable property of commercial and industrial value was removed from Danzig to the U.S.S.R. The character of the population was undergoing a rapid shift in 1946 with Poles replacing the Germans.

D'Argenlieu, Georges Thierry

), French naval officer and D'Argenlieu (1889statesman, was born in Brest, Aug. 8, 1889, attended the Ecole Navale, served in the Morocco campaign, 1912-14, and in the submarine service during World War I, reaching the rank of lieutenant commander. He resigned in 1920 and entered the Order of Discalced Carmelites. In 1939 he was made provincial of the order over all France. Mobilized in that year, he was named to the general staff of the Cherbourg arsenal. He escaped from a convoy taking him to Germany as prisoner and joined Gen. Charles de Gaulle, being appointed chaplain to the naval forces. Recalled to active service as captain, he headed the mission to Dakar in 1940 and, although wounded, directed the successful withdrawal of the party in a small boat under machine-gun fire. He took part in the seizure of Libreville and Port Gentil, and in 1941 became a member of the Council of Defense of the Empire. On July 9 he became high commissioner for the Pacific and far east. Promoted to rear admiral, he commanded French naval forces in Britain and on March 24, 1945, was named vicepresident of the Supreme Naval council and inspector general. He was a delegate to the United Nations conference in San Francisco and in August was named governor general of Indo-China. On Nov. 27, 1946, Annamese forces revolted; D'Argenlieu was ordered to suppress the outbreak.

Darlan, Jean Louis Xavier François

Darlan (1881–1942), French naval officer and statesman, was born Aug. 7, 1881, at Nerac. He entered the navy in 1899 and during World War I commanded naval guns on the western front and also served in the Balkans. He became a captain in July 1918 and advanced through grades to vice-admiral, commanding French naval forces, 1939–40. In June 1940 he was named navy minister in the Pétain government, and in Feb. 1941 vice-premier, holding at one time six portfolios, but relinquishing all

but defense when Pierre Laval returned to Vichy's favour. Darlan instituted many fascist laws and was considered an arch-collaborator, but in 1942 he entered into negotiations with the U.S. and arranged to be in Algiers when Allied forces landed Nov. 8. He was "captured," signed an armistice and became governor of North Africa Nov. 13 with Gen. Henri Giraud as military leader. Because of Darlan's collaborationist and anti-British record, there was much criticism, of which Gen. Dwight Eisenhower bore the brunt. Darlan was assassinated by Fernand Bonnier de la Chapelle, a De Gaullist, Dec. 24, 1942. The slayer was executed, but an annulment in 1945 cleared his record.

Davies, Joseph Edward

Davies (1876—), U.S. lawyer and diplomat, was born Nov. 29, 1876, in Watertown, Wis. After receiving his law degree from the University of Wisconsin in 1901 he was admitted to the Wisconsin bar and practised law until 1913. He was chairman of the Federal Trade commission (1915–16).

In 1936 Pres. Roosevelt named Davies as U.S. ambassador to the soviet union. Although a businessman and capitalist, Davies was popular with the Russians and was largely responsible for the good relations that subsequently developed between the U.S. and the soviet union. He left Moscow in 1938 to become ambassador to Belgium and Luxembourg. Recalled to Washington, D.C., in Jan. 1940, he served as a special assistant to Secretary of State Cordell Hull in charge of war emergency problems and policies. In May 1943 he carried a personal message from Pres. Roosevelt to Premier Stalin and was closeted with the soviet leader for six hours. In the light of subsequent events it was surmised that Davies at this conference had laid the groundwork for the Moscow and Tehran conferences held later that year. He was the author of Mission to Moscow (1941), an inside story of Russia later made into a motion picture. Shortly after the close of the European war, Davies arrived in London on May 27, 1945, as Pres. Truman's special envoy to Prime Minister Churchill to discuss "matters of common interest." As Harry Hopkins left for Moscow at the same time it was later understood that the two envoys were arranging for the subsequent Potsdam meeting. Davies attended the Potsdam conference as special adviser to Pres. Truman. On April 1, 1946, Davies was awarded the medal of merit by Secretary of State Byrnes for his diplomatic services.

Davis, Chester Charles

Davis (1887—), U.S. government official, was born Nov. 17, 1887, near Linden, Dallas Co., Iowa. He was graduated from Grinnell college in 1911 and subsequently became a newspaperman in South Dakota and Montana. He served as commissioner of agriculture and labour in Montana, 1921–25, then was associated with farm organizations and the processing business. In 1933 he became first head of the Agricultural Adjustment administration. In 1936 he was named to the board of governors of the federal reserve banks and later became president of the Federal Reserve Bank of St. Louis. He also served with the Export-Import bank and Commodity Credit corpora-

tion, and was federal food administrator (1943). Later he was on the War Production board civilian policy committee (1944) and advisory board of the Office of War Mobilization and Reconversion and on March 1, 1946, became chairman of the organizing committee of the Famine Emergency committee. In June 1946 he reported that a quota of 6,000,000 tons of wheat to be shipped to famine areas had been met.

In August he proposed to raise food production by supplying capital, machinery and "know-how" to China, India and South America.

Davis, Elmer Holmes

), U.S. news commentator and gov-Davis (1890ernment official, was born Jan. 13, 1890, in Aurora, Ind. A graduate of Franklin college (Franklin, Ind.), he was a Rhodes scholar at Oxford university, where he completed his studies in 1912. Reporter, editorial writer and author of more than a dozen books, he became, in 1939, one of radio's topflight news analysts. Pres. Roosevelt appointed him on June 13, 1942, as director of the newly created Office of War Information, which fused into a single agency all of the government's information services.

Davis' task, the co-ordination of the government's war publicity and propaganda, was not without its political difficulties. He engaged in a long struggle over the control of legitimate news with the war and navy departments and finally won the right in 1944 to share with the military the power to make decisions on release of war news. Prior to that time he was the target of sharp attacks by U.S. publishers whose complaint was that British journalists frequently released important news, such as the Cairo and Tehran decisions, before release of these items was authorized for U.S. newspapers. Davis later protested to the British information services against premature publication and breaking of news release dates. He also had internal difficulties within the OWI and on several occasions had to take up his case before Pres. Roosevelt to obtain authority as sole administrator of the agency. On Aug. 31, 1945, Pres. Truman abolished the OWI, transferring its functions to the state department. Davis' resignation was announced Sept. 12 and two months later he returned to the air as a news commentator.

Davis, Norman Hezekiah

Davis (1878-1944), U.S. banker, diplomat and Red Cross official, was born Aug. 9, 1878, in Bedford county, Tenn. In the early 1900s, Davis made a fortune in Cuban finance and sugar and headed the vast Trust Company of Cuba, serving as president of the firm until the entry of the U.S. in World War I. He was foreign loans adviser to the U.S. treasury, 1917, a member of the Armistice commission and of the Supreme Economic council, 1919. He also was financial adviser to President Wilson, serving as assistant secretary of the treasury, 1919-20, and undersecretary of state, 1920-21. Davis, who held many diplomatic posts, became a "roving" envoy for the Roosevelt administration; he participated in the World Economic conference at London, was chief of the U.S. naval delegation to the Five Power naval conference in London (1935) and was appointed by President Roosevelt to head the American Red Cross in 1938. He died July 2, 1944, in Hot Springs, Va.

Deafness

Complete deafness occurs rarely. A person unable to hear sounds shouted loudly into his ears has a total loss of usable hearing for speech. Practically speaking, this handicap is tantamount to being deaf. A deafened or hard-ofhearing individual has an impairment in hearing embracing all degrees of hearing loss from slight to severe or to just short of total deafness.

Aside from those born deaf or hard-of-hearing, in childhood or adolescence defective hearing is caused largely by measles, chicken pox, mumps, whooping cough, scarlet fever, infected tonsils and adenoids. In adulthood, added to the aforementioned conditions, are mainly influenza, repeated colds, occupational diseases, head trauma, Meniere's disease, drug toxaemias, meningitis, tumours of the nerve, syphilis, tuberculosis, otosclerosis and senile changes.

Drugs such as sulfonamides and penicillin assisted in alleviating hard-of-hearing caused by meningitis, scarlet fever and similar infections. In one survey of 1,000 cases of otosclerosis, 50% began between the 16th and 30th year of age, and 14% in those younger than 16.

If fixed changes occur in hearing before adulthood, there is not much that can be done to improve the condition of hearing.

The Committee on Conservation of Hearing of the American Academy of Ophthalmology and Otolaryngology stated its belief that parents fail to realize the importance of symptoms in a child such as earaches, infected adenoids and tonsils and discharging ears. These symptoms are signs of future impairment of hearing, although the disability may not show up for many years to come. A physician or ear specialist should be consulted immediately in order to prevent further damage to the organ of hearing.

In 1946, the Volta bureau, Washington, D.C., estimated 95,000 persons deaf enough to require specialized instruction in schools for the deaf. In the same year, the number of hard-of-hearing individuals in the United States was estimated to be 10,000,000 to 13,000,000. This round number included all shades of hard-of-hearing from slight to extreme. Of these, possibly 3,000,000 were seriously handicapped and should have used hearing aids or studied and employed lip reading.

Probably no more than 600,000 actually used hearing aids and lip reading.

The reasons why a larger number of deafened people did not use hearing aids more remained controversial. The most important reason seemed to be a matter of pride; next the cost, both the original expense and the upkeep, and finally, a delay awaiting better technical development in the instrument. When horns, ear trumpets, and speaking tubes were the only aids available 50 years before, they were regarded as a symbol of old age, and this impression apparently was carried over to the modern electrical hearing aid. In 1946 more young and middle-aged persons were wearing aids, and this stigma was passing away. Indeed,

the modern compact efficient instruments were actually less conspicuous than eyeglasses, especially when worn by women, since they could hide the devices under their wearing apparel and cover the earpiece with their hair.

Because of the community of interest existing between persons with similar handicaps, the social aspect was one important factor in the growth of the American Hearing society (formerly the American Society for the Hard-of-Hearing), Washington, D.C. This society and its 118 components in other cities were organized to furnish information on hearing aids and make arrangements for instruction in lip reading and other services in aural rehabilitation.

Hard-of-hearing individuals having difficulty in understanding conversation at a distance of five feet or less in relatively quiet places such as the office or home may be helped by wearing a hearing aid. Many authorities agreed that an individual with an average hearing loss of 35 decibels or more in the better ear at 512, 1,024 and 2,048 cycles per second (the speech range) usually experiences sufficient difficulty understanding speech to make advisable the use of an instrument.

For many years, technical progress in the hearing aid field followed telephone research, and hearing aids were essentially miniature telephones. Later, as the development progressed on the electronic tube which greatly magnifies sound, auditory research followed the electronic industry and the sets became virtually small public address systems.

The modern hearing aid consists of a microphone, amplifier, receiver and batteries. Complete, the majority of hearing aids weigh approximately 16 to 18 oz. including A and B batteries. Most of the sets come in three parts—receiver, battery pack and microphone-amplifier case, all three of which are connected by wires. If air conduction, the receiver is attached to a moulded earpiece; if bone conduction, the receiver is pressed against the mastoid by a spring band which fits over the head. Another type of hearing aid consisting of two visible parts only gained considerable popularity during the decade. The batteries are encased in the same unit with the amplifier and microphone. The receiver is connected to the case with one cord. This type of hearing aid with miniature batteries weighs about 10 oz.

When selecting a hearing aid, the deafened person is advised to have a complete otological examination by an otologist (ear doctor). Since modern hearing aids do not function at their best efficiency without a moulded earpiece, the first thing to do is to have a personalized earpiece made. This can be accomplished by consulting an otologist. If the physician does not wish to do this work, he will refer the patient to a qualified person.

Routine otological examinations of hard-of-hearing persons should include audiometric tests and will usually indicate to the otologist whether the patient will be benefited sufficiently to warrant the expense of purchasing an aid. Furthermore, it is important that the otologist determine whether an air conduction or a bone conduction instrument will give the better result.

The cost of hearing aids in 1946 ranged from \$40 to \$190 approximately. The operating expense of a hearing aid depended largely on the number of hours the aid was in use. Roughly estimating, the battery upkeep was \$3 to \$4 per month.

Most of the hearing aids were sold by hearing aid salesmen in 1946. However, hearing clinics were being established in the larger cities, and information regarding these clinics might be obtained from the local medical society.

In many cities, local chapters of the hearing societies had hearing aid bureaus in which an opportunity was given the hard-of-hearing person to try several makes of reliable hearing aids and to select the instrument which seemed most satisfactory to him. These services became popular because the hard-of-hearing individual was able to make a selection and compare one hearing aid with another without being influenced by a salesman.

Hearing clinics or centres had been established in schools of medicine at universities. In these centres, complete service for selecting and fitting a hearing aid was made available. The deafened person received an otological examination by a physician, an opportunity to try several hearing aids under normal conditions, a prescription for a hearing aid, and auricular training.

During World War II, U.S. army and navy rehabilitation centres introduced elaborate testing and fitting methods. Specialists did not agree on the precise value of these methods for selecting an instrument. Hearing aids could not be fitted by any method comparable with fitting of eyeglasses. Many deafened individuals were totally satisfied with a hearing aid selected over the counter by themselves. In difficult cases, there was apparently a definite advantage in employing the fitting procedures. One of the important contributions of the war period regarding rehabilitation of hearing was that a person required instruction on how to use the instrument. Specialists observed that lip reading is an essential factor of the training and instruction. Lip reading and a hearing aid complement each other, and a deafened person having a knowledge of the art of lip reading can understand speech better.

Even in clinics where hearing aids are carefully selected, patients should be instructed on what to expect to hear with a hearing aid. Investigators found that about 75% need formal drill for speech discrimination; approximately 50% need training for sound localization; and practically all need practice hearing against different levels of background noise. In groups where speech is rapid and shifts from person to person, specialized training is advised. One complaint levelled against hearing aids in general is that so many people who purchase them often put the instrument in the bureau drawer after a trial of a few weeks. Auricular training is offered to teach the hard-ofhearing to utilize every fragment of his residual hearing. Hearing a sound is one thing, but interpreting or understanding what that sound means is the purpose of auricular training. It is the art of making sound meaningful to the hard-of-hearing.

Research was done in the field of surgery for the amelioration of the hard-of-hearing during the decade. The fenestration or window operation was more widely accepted. This operation was more successful in the cases of deafness caused by some form of blocking in the ear, that is, when the nerve was not impaired. A fenestration operation supplies a substitute passage through which sound vibrations may reach the inner ear and bypass the injured and diseased part. This operation provided one hope of rehabilitating the hard of hearing by surgery and medicine. The operation does not restore the hearing to full normal volume but is capable in some cases of bringing it up to a useful level. The patients should be selected carefully because in some instances, hearing is made worse rather than better.

At the beginning of the decade, the (carbon) telephone type of hearing aid was used almost exclusively, and the vacuum tube (electronic) type was hardly known except

as a large, lunch boxlike contraption which the deafened person carried around by hand. The hearing aid bureaus, clinics and centres were practically unknown. Fenestration operations were considered impractical.

In the ensuing ten years, the vacuum tube hearing aid was greatly improved, while the volume and weight was reduced many fold. Batteries were greatly diminished in size and in weight. The new mercury-type of hearing aid battery was being experimented with, in expectation that the instruments might be made still smaller. The profession believed that a wearer of a hearing aid must have instruction to assist the individual in adjusting himself to the use of his instrument, both operationally and psychologically.

Industrial organizations were being urged to analyze their job opportunities and to consider the deafened for employment. Some manufacturing organizations had found that deafened persons, with hearing aids, might be qualified to hold many important positions requiring skill, application and judgment. A list of accepted hearing aids could be obtained from the Council on Physical Medicine of the American Medical association. A list of requirements on which the acceptance of these hearing aids is based also could be obtained from the office of the council upon request. (See also Ear, Nose and Throat, Diseases of.)

Death Statistics

Registration systems for recording deaths have been developed most fully in the English-speaking countries and in the countries of western Europe. To eliminate the effect of variations in numbers of population in comparisons of death statistics among countries, it is usual to compute death rates per 1,000 of population. For this purpose the annual deaths of a country are divided by its population for the same year. For example, 1,411,338 deaths were recorded in the United States during 1944, and the estimated midyear population, exclusive of the armed forces overseas, was 132,552,000; the death rate was therefore 10.6 per 1,000 of population.

International Comparisons.—For the few countries whose civilian populations were not directly affected by the ravages of World War II, death rates remained either at a satisfactory level or showed some evidence of improvement in the decade beginning with 1937. In that year, according to the data in Table I, the United States had a death rate of 11.3 per 1,000; this dropped to a minimum of 10.4 in 1942, the first full year that country spent at war. The rate for 1945 was only 10.6; this figure excluded the armed forces overseas. The death rate for Canada remained at a level of about 10 per 1,000 during the period of survey. In its prewar years from 1937 to 1939, the death rate for England and Wales was about 12 per 1,000. However, the next year, 1940, witnessed the German air blitz against the civilian population of England and

Wales; the resulting deaths contributed, in good part, to the rise in the death rate for that year to 14.3 per 1,000. Some effect of this form of warfare was also reflected in Great Britain's death rate of 12.9 in 1941, but, with the virtual cessation of aerial bombings of British cities in subsequent years, the death rate fell to the immediate prewar level of about 12 per 1,000. Australia and New Zealand, with death rates of about 10 per 1,000, experienced gradual increases in their rates from 1937 to 1942; most of this rise was generally attributed to the effect of the increasing proportion of aged persons in these countries. The death rate of white population in the Union of South Africa was less than 10 per 1,000 from 1938 to 1943.

Many of the European countries occupied by Germany experienced sharp rises in their death rates in 1940, with the rates for subsequent war years still above the average for the prewar period 1937-39. For example, France had an average death rate of 15.2 per 1,000 during 1937-39; this rose to 18.2 in 1940, but for subsequent years to 1943 declines were reported. However, the rate for France in 1944 jumped to 19.3 per 1,000. The record for Belgium was very much like that for France, but with rates at lower levels. Death rates for the Netherlands rose from a 1937-39 average of 8.6 per 1,000 to a 1940-43 average of almost 10 per 1,000. Reports from Norway showed death rates for the war period not far different from the immediate prewar average. Some improvement was actually indicated in the record for Denmark until 1943. These data from the overrun countries during the period of their occupancy were subject to question, in view of the character of their governments.

Of the axis countries the reported death rate for Germany rose from an average of 11.7 per 1,000 in 1937-38

DEATH STATISTICS

to a peak of 12.7 in 1940; some improvement was indicated for the next three years, but not to the prewar level. The record for Italy showed decreases in death rates from 1937 to 1939, but for each subsequent year through 1943 there was a rise in the rate. Japan's rate for 1941, the year hostilities began against the United States, was 15.4 per 1,000, much lower than for any preceding year after 1937.

Among the neutral countries, Sweden was favoured with a gradual downward trend in its death rates from 1937 to 1942, while for Eire the rates remained practically level. Of the Latin-American countries for which data were available, Mexico, Chile and Venezuela, with high death rates, showed marked improvement after 1937, while Argentina and Uruguay, with low rates, showed slower improvements.

War Deaths.—The tremendous toll of human lives taken by World War II will probably never be known with any satisfactory degree of accuracy. In addition to the lives lost among the armed forces of the warring nations, millions of noncombatants died of disease, starvation and wanton murder. Civilian populations were subjected, furthermore, to death by large-scale bombing and by the forces of atomic energy released for the first time in history.

Up to the end of World War II the British empire had lost 353,652 men in the armed forces killed in action. Of this number, the United Kingdom accounted for 244,723; Canada 37,476; Australia 23,365; New Zealand 10,033; South Africa 6,840; India 24,338; and the colonies 6,877. There were 30,189 merchant seamen killed. In addition, up to the end of the war in Europe, 60,585 civilians were killed, of whom 26,920 were men, 25,392 women, 7,736 children and 537 unidentified.

The armed forces of the United States lost 396,637 by death during World War II; this included personnel killed in action, deaths from wounds or injuries, deaths from nonbattle causes and the missing. Of this total, 308,978 were in the army (according to a report dated June 27, 1946), and 87,659 in the navy, marines and coast guard (as of June 1, 1946). The biennial report of the chief of staff of the United States army, dated Sept. 1, 1945, stated that the war in Europe resulted in 772,626 battle casualties, of whom 160,045 were dead, while the Pacific area had 170,596 casualties and 41,322 dead.

The efficacy of modern health practices in the control of disease among troops was shown by the following: the annual death rate from disease among the men in the Mexican War was 10%; for the Civil War (Union troops), 7.2%; Spanish War and Philippine Insurrection, 1.6%; World War I, 1.3%; World War II, 0.6%.

The United Nations information office gathered statements regarding war deaths from a number of sources; many of these reports were apparently only broad estimates. Thus, a Red army general in Berlin stated that soviet war deaths were between 12,000,000 and 15,000,000—half civilians and half soldiers. An official statement listed 8,219 as the number killed in the brief fighting against Japan.

According to a French report, that country had about 167,000 of its armed personnel killed in action. Civilians executed by the Germans were estimated at about 100,000 and deaths among deportees to German camps at about 175,000. There were, in addition, many thousands of civilians killed by air action and also during the brief battle of France in 1940.

Belgium war dead included 7,760 military personnel and 20,271 civilians. The Netherlands lost 6,238 dead in its armed forces, and about 25,000 killed among its civilian

underground workers. Norway was estimated to have lost about 10,000 lives during the war; Denmark, about 3,000.

Poland was estimated to have lost 5,000,000 lives, of whom about 3,000,000 were Jews in concentration camps. About 265,800 were killed or wounded among its armed forces. Civilian and military deaths in Yugoslavia were estimated at about 1,685,000. Greece lost about 415,300.

An official report for China stated that deaths among military personnel during eight years of war against the Japanese numbered 1,310,224. There were undoubtedly many times this number of civilian lives lost by disease, starvation and murder.

German military deaths during World War II were estimated at 3,250,000 (Statistical Bulletin of the Metropolitan Life Insurance company, Jan. 1946). The medical branch of the U.S. strategic bombing survey estimated that Allied bombing killed about 500,000 civilians in Germany, including imported labour.

Military deaths among Italians, while on the side of the axis, were reported as about 60,000, but this was very likely an understatement. Italian army dead while on the side of the Allies numbered 17,494; navy deaths came to 3,584.

An official Japanese statement, dated Sept. 5, 1945, reported about 350,000 deaths in the army of that country and 158,795 deaths in the navy. Allied air attacks on Japan resulted in 241,309 deaths and 313,041 wounded among the civilians. The atomic bomb released on Aug. 6, 1945, over Hiroshima caused 49,221 civilian deaths and wounded 58,839, while the atomic bomb over Nagasaki on Aug. 9, 1945, killed 21,501 civilians and wounded 51,580.

Military deaths for Rumania may have been about 100,000; Hungary, about 75,000; and Finland, about 50,000 (Statistical Bulletin, Jan. 1946).

Death Rates According to Age, Race and Sex.-Death rates specific for age, race or sex may be computed by dividing deaths within a defined category by the corresponding population. Death rates specific for age during the decade were generally high in the first year of life, decreasing to a minimum about age ten and thereafter rising with advance in age. Thus, for the population in the United States during 1944, excluding the armed forces overseas, the data in Table II show that the death rate was 43.3 per 1,000 population under one year of age. The death rate fell to a low of 0.9 per 1,000 at ages 5 to 14 years, then rose to 9.8 at ages 45 to 54 and reached a level of 119.6 at ages 75 and over. Death rates were usually lower for females than for males, and, in the United States, lower for white persons than for Negroes. For example, in 1944 the death rates per 1,000 were 12.3 for white males, 8.8 for white females, 13.9 for Negro males and 11.0 for Negro females.

*Death rates for 1942	o 1944 based	upon populati	on excluding n	nembers in the

armed forces overseas.

All ages and each race and sex category shared in the general improvement in death rates from 1937 to 1944. The improvement was relatively greatest among young children and smallest at the older ages of life. Thus, at ages 1 to 4 years, the rate in 1944 was just over half that in 1937; at ages 5 to 14, the decrease was by about one-third, although this age group showed little improvement after 1940. The next age group, likewise, showed little change after 1940, a situation attributable, in large part, to the high mortality from accidents among men of these ages in the armed forces at home. For each of the age groups from 25 to 64 years shown in Table II, the year 1944 had the lowest death rates since 1937; at ages 75 and over, only one year, 1942, had a better record than 1944.

Negroes made a relatively better showing than white persons in improvement of death rates; for both males and females in this category the year 1944 was the best on record. For most of the period under survey, white females showed only small changes in death rates, although the tendency was downward. White males had higher death rates in 1943 and 1944 than in 1937. The high level for these two years arose largely from the great number of fatal accidents among men in the armed forces, as previously mentioned. A pneumonia epidemic prevalent in 1943 was another factor in the rise in the death rate for both sexes for that year.

Rates According to Cause of Death.-The more important causes of death according to age, and their death rates per 100,000 population of the same ages in the United States during 1944 were: ages 1 to 4, all causes 231, pneumonia and influenza 45, accidents (excluding motor vehicle) 39, diarrhoea and enteritis 15, congenital malformations 12, motor vehicle accidents 11; ages 5 to 14, all causes 93, accidents (excluding motor vehicle) 21, motor vehicle accidents 10, pneumonia and influenza 7, diseases of the heart 6, appendicitis 4; ages 15 to 24, all causes 201, accidents (excluding motor vehicle) 48, tuberculosis 34, motor vehicle accidents 21, diseases of the heart 13, pneumonia and influenza 9; ages 25 to 44, all causes 366, diseases of the heart 59, tuberculosis 51, cancer 41, accidents (excluding motor vehicle) 32, pneumonia and influenza 18; ages 45 to 64, all causes 1,435, diseases of the heart 471, cancer 253, cerebral haemorrhage 127, nephritis 91, tuberculosis 64; ages 65 and over, all causes 6,781, diseases of the heart 2,622, cerebral haemorrhage 839, cancer 833, nephritis 580, pneumonia and influenza 350. (For causes of death in the first year of life, see INFANT MORTALITY.)

In the United States practically all infectious diseases showed improvements in death rates from 1937 to 1944 (see Table III). That this improvement should have continued through the war years 1942 to 1944 was all the more remarkable, inasmuch as during this period a large proportion of the civilian medical and nursing personnel was drawn into the armed forces; hospital facilities were overtaxed; there was a large movement of civilian population; unsanitary and crowded housing was built around newly developed war industries; and the rapid movement of great numbers of men to and from foreign areas provided new opportunities for the spread of disease.

There was a steady decrease in the death rate from typhoid fever; the rate in 1944, 0.4 per 100,000, was only about one-fifth of the rate in 1937. Of the principal communicable diseases of childhood scarlet fever maintained a level of only 0.3 per 100,000 since 1941, a level of about one-fifth that in 1937. By 1941 the death rate from diphtheria, 1.0 per 100,000, was only half that in 1937. In the

*Deaths from puerperal causes per 1,000 live births. †Deaths under one year of age per 1,000 live births.

case of measles there were marked fluctuations in the death rate with no systematic improvement, but for whooping cough the rates tended downward. There were severe epidemic outbreaks of acute poliomyelitis (infantile paralysis) in 1937 and 1944; the death rate for both of these years reached 1.0 per 100,000, although it fell as low as 0.4 in two of the intervening years. Diarrhoea and enteritis, a condition most dangerous in the first two years of life, had a rapid decrease in its death rate, from 14.7 per 100,000 in 1937 to 8.8 in 1942, but the two succeeding years showed increases; this may, perhaps, have been a consequence of crowded housing and lack of adequate sanitary facilities during the war.

Of the respiratory conditions, influenza had a decrease in its death rate from 29.5 per 100,000 in 1937 to only 8.1 in 1942; the setback in the next two years reflected an outbreak of this disease which rose to epidemic proportions about the middle of Dec. 1943 and reached its peak during the first two weeks of Jan. 1944. The rapid advance in chemotherapy was undoubtedly the principal factor in the great improvement in the death rate from pneumonia after 1937. In that year, the death rate was 85.4 per 100,-000, but it fell rapidly to a low of 47.6 in 1942; the rise in 1943 again may have been associated with the outbreak of influenza that year. Contrary to all expectations the death rate from tuberculosis continued to improve through the war years, notwithstanding the unusually crowded living conditions of the population. In 1937, the death rate from tuberculosis was 53.8 per 100,000, while in 1944 it was only 41.3. Syphilis, another disease usually expected to show increased death rates during war, also fell to lower levels; each year from 1937 through 1944 showed an improvement over the preceding year.

During the period of survey, there were gradual increases in the reported death rates from cancer and from diabetes mellitus. These increases may have been more apparent than real, for they resulted partially from the fact that the proportion of aged in the population was increasing (these diseases are most common in old age) and also, in part, from better case finding. The death rate from cancer rose from 112.4 per 100,000 in 1937 to 129.1 in 1944; the corresponding rates for diabetes mellitus were 23.7 and 26.4.

A large part of the upward trend in the death rates from cerebral haemorrhage, diseases of the heart and arteriosclerosis may also have been due to the increasing proportion of aged in the population. The proportion of aged in the population within the United States increased rapidly during 1943 and 1944 as men in the armed forces were shipped overseas, with the result that diseases associated with advanced age assumed added importance in the total picture. The death rates per 100,000 population (excluding the armed forces overseas) from these conditions in 1937 and 1944 were, respectively: cerebral haemorrhage, 86.7, 93.7; diseases of the heart, 268.9, 315.4; arteriosclerosis, 17.1, 19.3. Death rates from nephritis (all forms) rose to a peak of 82.9 per 100,000 in 1989 but fell to 69.2 in 1944. In contrast to this picture for the cardiovascularrenal diseases based upon crude death rates, an analysis of the trend of the death rates for this group of diseases, according to age and sex in an insurance experience showed notable improvements in each specific category (Statistical Bulletin of the Metropolitan Life Insurance company, March 1946, p. 5). In commenting upon the favourable trend of mortality at the younger ages attention was drawn to the decreased incidence of childhood infections which frequently affect the heart. The same consideration also entered into the improvement in the death rate from the cardiovascular-renal conditions in early and middle adult life; a further factor at this stage of life, particularly among men, was the decrease in cases of syphilitic heart disease.

There was no change in the level of the death rates from ulcer of the stomach or duodenum, which remained at somewhat under 7 per 100,000. Death rates from appendicitis decreased steadily, so that the rate for 1944, 5.9 per 100,000, was just about half that for 1937. This improvement was attributed largely to the use of chemotherapy in cases of appendicitis complicated by peritonitis. Another important factor in the improvement was the educational campaign waged throughout the United States to warn against delay in obtaining medical attention and against the use of laxatives when there is abdominal pain.

The frequency of fatalities from accidents of all kinds dropped sharply from 1937 to 1938 and then remained at a level somewhat over 70 per 100,000 through 1944. However, in this total picture the death rate from motor vehicle accidents showed marked fluctuations up to 1941; with the restriction in the use of automobiles because of gas rationing, the death rate fell in 1942 and reached a low of about 18 per 100,000 in 1943 and 1944. After gas rationing was lifted in 1945 the death rate from motor vehicle accidents advanced rapidly. All forms of accidents, other than those in connection with motor vehicles, rose from 46.3 per 100,000 in 1941 to 53.5 in 1944; some of this rise could be attributed to occupational fatalities associated with the increased industrial activity during the war. Homicides in the United States dropped steadily from 1937 to 1944, from 7.6 to 4.9 per 100,000.

An indication of the trend of death rates according to cause through 1945 was made public by the Metropolitan

Life Insurance company. Improvements from 1944 to 1945 were noted in the case of measles, scarlet fever, influenza, pneumonia, tuberculosis, syphilis, diabetes, chronic heart disease, diarrhoea and enteritis, appendicitis, chronic nephritis and suicides. Causes of death showing higher rates in 1945 than in 1944 were: typhoid fever, whooping cough,

diphtheria, cancer, cerebral haemorrhage and accidents (all forms).

Maternal Mortality.-Maternal mortality is usually expressed in terms of annual deaths from puerperal causes per 1,000 live births. The decline in maternal mortality in the United States was particularly rapid after 1937, when the rate was 4.9 per 1,000 live births; this was reduced by more than half by 1944, when the rate was only 2.3 per 1,000 live births. Among white women, the maternal mortality rate was 1.9 per 1,000 live births, while among Negroes it was 5.0. In 1944, deaths during or after delivery accounted for 64.6% of the total of 6,369 puerperal deaths, deaths before delivery for 14.4%, ectopic gestation for 5.4%, and abortion for 15.6%. Of the puerperal deaths in the United States in 1944, septicaemia accounted for 35.7%, puerperal toxaemia for 25.2%, and haemorrhage for 18.5%. Most of the improvement in maternal mortality was through the reduced incidence of puerperal septicaemia, in which the increasing use of the sulfonamides was undoubtedly an important factor.

In point of age, maternal mortality was at a minimum among mothers 20 to 24 years of age. In 1944, the rates per 1,000 live births according to age of mother were: ages 10 to 14, 4.2; ages 15 to 19, 2.1; ages 20 to 24, 1.4; ages 25 to 29, 1.7; ages 30 to 34, 2.8; ages 35 to 39, 4.5; ages 40 to 44, 6.8; and ages 45 to 49, 9.0.

A study (Statistical Bulletin, Metropolitan Life Insurance Co., July 1945) showed that maternal mortality was lowest where hospital confinement was most frequent, namely, in the Pacific coast states. The improvements from 1940 to 1943 were most rapid in the southern and mountain states, which generally had the highest rates; these areas also had the smallest proportions of hospitalized births.

Mortality According to Marital Status.-From 1940 records for the general population of the United States, it was found that among males the unmarried had an excess mortality of 49%, widowers an excess of 108% and divorced an excess of 123%. (See Table IV.) Among females, the single had a mortality 10% greater than the married, widows 55% and divorced 57%. The advantage in mortality of married males over the unmarried was found in the case of each of the more important causes of death. Mortality among unmarried males, as compared with the married, was particularly high in the case of tuberculosis, syphilis, homicide, suicide and accidents. Whereas married males showed to best advantage as compared with the unmarried for each cause of death listed in Table IV, among females there were several causes for which spinsters made the best showing, namely, diabetes mellitus, cerebral haemorrhage, appendicitis, cirrhosis of the liver, nephritis and death by homicide. The incidence of death by homi-

cide, however, was particularly high among widows and divorcees as compared with married women. On the whole mortality from tuberculosis, syphilis and suicide was substantially greater among unmarried women than among the married.

The relatively high mortality from tuberculosis among single persons may have been indicative of the selective factor in marriage, since persons afflicted with the disease would usually hesitate to assume new responsibilities. Although the high mortality from tuberculosis among the widowed may appear to indicate the possibility that the disease was acquired from the spouse, the data on hand provided no positive evidence.

Social considerations accounted very largely for the high mortality from syphilis among the unmarried. This may also have been the case in regard to the high mortality from suicide and homicide among the unmarried.

The lower mortality of the married person is usually attributed to the selection of the healthier persons in marriage. In addition married men are likely to take better care of their health than the unmarried and also to receive better care when they are ill.

Mortality in Relation to Social Class.-An analysis of mortality records in England and Wales during 1930-32 (the Registrar-General's Decennial Supplement, England and Wales, 1931. Part IIa: Occupational Mortality, London, 1938) showed a definite gradation for males from low to high mortality rates in proceeding from the class consisting of the professional and economically better situated occupations to the class of labourers and other unskilled workers. The improvement in mortality from 1921-23, the date of the previous study, to 1930-32, was more rapid for the poorer class of occupations than for the better situated class; in other words the differences in mortality between the several occupational classes in 1930-32 were not as great as in 1921-23. When the married women in the 1930-32 study were classified according to the occupations of their husbands, the mortality of the wives also showed a marked progression from low for the most favoured class to high for the poorest class. This suggested that for most occupations, mortality was not influenced so much by the occupational risks involved as it was by the social environment of the workers. The same kind of variation in mortality from low to high was found when children under two years of age were classed according to the occupation of their fathers.

Expectation of Life.—The expectation of life at birth, or the average length of life, is the average number of years of life for newly born babies, assuming that they will experience, throughout their lifetime, the age-specific death rates observed within a specified calendar year or period. The expectation of life at any age is the average number of years remaining after that age, assuming the age-specific death rates remain constant as of the period for which the figure is computed.

Among the countries with the best records were New Zealand, where, in 1934–38, males had an average length of life of 65.46 years, and females of 68.45 years; the Netherlands in 1931–40, with 65.7 years for males and 67.2 years for females; and Sweden, in 1936–40, with 64.30 years for males and 66.92 years for females. At the other extreme was India (1931), with 26.91 years for males and 26.56 years for females. (See Table V.)

The records for the average length of life in the United States (white population), England and Wales, and Canada were not much different. In 1937, the figure for males in

England and Wales was 60.18 years and that for females was 64.40 years. The corresponding figures for the United States, in 1930-39, were 60.62 and 64.52 years. In Canada, in 1940-42, the average length of life was 62.95 years for males and 66.29 years for females; these may be compared with corresponding figures of 62.81 years and 67.29 years for the United States in 1939-41.

The expectation of life in the United States in 1944 according to race and sex, and for every fifth age of life is shown in Table VI. White females had an expectation of life at birth of 68.95 years, and white males of 63.55 years, while among Negroes, the corresponding figures were 58.99 years and 55.30 years. At age 40, the expectation of life was: white males, 30.39 years; white females, 33.97 years; Negro males 26.26 years; Negro females, 28.92 years.

According to life tables published by the United States bureau of the census, using 1939 mortality data, the average length of life was better in rural areas than in urban places; the north generally made the best showing and the south the poorest. (See also Accidents; Census Data, U.S.; Infant Mortality; Suicide Statistics.)

Debts, National

The national debt of a country generally refers to the total financial obligations of the state arising out of the issuance of public securities. It does not include the debt of

all governmental units and agencies but only the obligations of the central government. The national debt usually indicates the extent to which the central government has resorted to borrowing over the years to make up the deficit between its outlays for government services and investment and its revenues from taxation and various minor sources. As the manner of keeping official accounts varies from country to country, however, there are many exceptions to this definition. On the one hand, agencies or corporations of the central government are sometimes set up outside the budget so that their debt does not appear in the national debt. On the other hand, obligations are sometimes assumed by the government and included in the official national debt statistics which did not originate in a borrowing operation. The U.S. adjusted service bonds issued to veterans were an example of this type of obligation included in the national debt total of the United States.

United States.—The decade 1937–46 was one of unusual significance in the history of the U.S. national debt. The earlier half of the decade witnessed a fundamental change in the economic philosophy of public debt management while the latter half of the period brought a tremendous expansion in the national debt through its use in financing the war effort.

It may be seen from Table I that the national debt first rose to sizable proportions during World War I, reaching a peak of \$25,482,000,000 in 1919. In the course of the eco-

nomic prosperity of the 1920s the debt was substantially reduced so that by 1930 it had fallen to \$16,185,000,000. With the onset of economic depression and the deflationary spiral after 1930, the national debt began to rise by fairly substantial amounts. There was an increase in the neighbourhood of \$3,000,000,000 in the fiscal years of 1932 and 1933. This rise resulted not from any overt policy decision but because government revenues were substantially reduced with the cumulative contraction of economic activity.

A new chapter in the history of the national debt began with the advent of the Roosevelt administration, which soon began to experiment with government expenditures for public works, relief, agricultural rehabilitation and other purposes as a means of combating economic depression. This idea became crystallized only after the course of time, particularly after the publication in 1935 of The General Theory of Employment, Interest and Money by Lord Keynes. The idea was developed that government expenditures designed to raise the level of economic activity should be financed by borrowing rather than by taxes. The reason was that although government expenditures financed in either way would have the same direct repercussions upon the economy, an increase in

taxes at a time of underemployment would, in most instances, act as a curtailment of private spending whereas an increase in the national debt would not exercise any drain on private purchasing power.

It was largely under the stimulus of the pump-priming idea that the U.S. national debt was increased so substantially from 1933-40. Over this period the debt almost doubled, rising to \$42,971,000,000 in 1940. The fiscal years 1936 and 1939 saw the largest debt increases of the period. In the earlier year the passage of a large Soldiers' Bonus act contributed substantially to the debt increase. In the latter year, however, the debt increase was caused entirely by the effort of the administration to reverse the 1937-38 recession. It constituted the first fully articulated experiment in using government expenditures and the management of the public debt to foster economic recovery.

During the recovery period, another innovation was introduced into the government debt structure. This was the creation of various government corporations operating outside the budget, whose obligations were not included in the national debt but were guaranteed by the federal government. The most important of these corporations were: the Federal Farm Mortgage corporation, the Commodity Credit corporation, the Home Owners Loan corporation and the Reconstruction Finance corporation. As can be seen in Table II the guaranteed obligations reached a peak in 1941 of \$6,371,000,000. In the course of the war, this guaranteed debt was gradually incorporated into the public debt.

The national debt entered a new phase with the inauguration of the rearmament program in the middle of 1940. New tax measures were instituted to increase government

revenues, but the scale of national defense expenditures was soon so large that a substantial increase in the national debt was inevitable. By mid-1941 the debt had risen to \$48.061.000,000.

With the transformation of the rearmament program to a total war effort after the Japanese attacked Pearl Harbor, there was a further tremendous increase in government expenditures that was to persist until victory was achieved in 1945. Large increases in taxes were achieved, but revenues were continuously far less than the government's expenditures. The result was an unprecedented increase in the national debt. In the three years from 1942, the increase in the national debt was more than \$50,000,000,000 a year, with the total reaching \$258,682,000,000 on June 30, 1945.

As military expenditures of the government were drastically reduced after the end of the war, the phase of tremendous debt expansion came to an end. There was a further increase in the debt in the transition year of 1946, but this was of considerably smaller proportions than the increases experienced during the war.

Several aspects of the treasury's debt policy during World War II deserve attention. Late in 1942, the treasury began the policy of raising the bulk of its financing in short war-loan drives. In the course of the war seven such drives were held, which yielded the bulk of the government's wartime financing. The raising of funds from noninflationary sources was continuously stressed with the result that a greater proportion of the debt was sold to nonbank investors. It may be seen in Table III that government securities held by banks increased from \$18,-600,000,000 to \$107,100,000,000 during 1940-46, while the total held by nonbank investors rose from \$29,300,000,000 to \$161,500,000,000. All the means of modern publicity were used to promote the sale of U.S. savings bonds, with the result that the volume of these securities outstanding increased to \$49,035,000,000 in 1946.

An important element in the sale of savings bonds throughout the war period was the widespread adoption of the pay roll deduction plan sponsored by the treasury. The peak in the number participating was reached in June 1944 when about 27,600,000 employees had \$540,000,000 of their monthly pay deducted for the purchase of war bonds. During the fiscal year 1945, the total sale of bonds by this method was about \$6,000,000,000 out of total gross sales in this category of securities of \$11,600,000,000. With the beginning of a declining trend in employment in war industries, the number of persons participating in the pay roll savings plan declined. By mid-1946 there were only about 7,500,000 persons purchasing savings bonds by the pay roll deduction plan. (See also War Bonds.)

A significant feature of the management of the public debt during the war was the low interest rate policy that was adopted and maintained by the government. World War II was financed at an average rate of interest of 1.8% on the securities issued, compared with an average rate of 4.25% on the securities issued to finance World War I. Interest rates during the period of World War II rose only moderately above the level prevailing during the depression of the 1930s,

the highest rate for long-term market issues being 2.5%. As a special inducement to individuals to increase their savings and thus assist in the government's anti-inflation program, the interest rate on savings bonds held to maturity was fixed at 2.9%.

For securities outstanding, the computed annual rate of interest amounted to 2.015% in Aug. 1946 compared with 2.26% in June 1942. As may be seen in Table II, the major factor in this decline was the proportionate rise in certificates of indebtedness and notes outstanding.

Although these securities carried a low interest rate, they were a popular outlet, because of their high degree of liquidity, for business funds being built up during the war. The large increase in the holdings of government securities by nonfinancial corporations during World War II is shown in Table III.

clining economic activity from 1929-33 the falling-off of revenues and increasing expenditures for relief added to the debt total. From 1933 on, state and local debt varied little, as the federal government took over the major burden of relief and also financed much of the public works of state and local governments.

Finland (markkaa)

During 1941 and 1942, state and local debt declined slightly as government revenues increased with the rising tide of national income and as scarcity of materials tended to limit public works expenditures. This trend was accelerated during the subsequent war years as the expansion of the national income led to ever greater revenues of state and local governmental units. From its peak in 1940 of \$20,246,000,000, total state and local debt declined to \$16,552,000,000 in 1945. All types of governmental units experienced debt reduction, though the decline in state and county debt was proportionately larger than for municipalities and school districts.

Other Countries.-National debt statistics covering the decade 1937-46 for the leading countries of the world are given in Table V. In the period before World War II, the changes in national debts were of moderate proportions. There was considerable diversity in trend as debts were rising in some of the countries but falling in others. For almost the entire world this situation was dramati-

cally changed after the outbreak of World War II. The debt of all belligerent countries rose phenomenally, and even some of the neutral countries had to increase their expenditures to an extent that made borrowing necessary.

The experience of all the major belligerent powers was similar. The debt of the United Kingdom was increased to £25,092,000,000 by 1946 from £9,083,000,000 in 1940. The national debt of Germany was already r.m.47,950,000,000 in early 1940 because of the heavy armament expenditures during the latter half of the 1930s. By the time the country was defeated, however, the national debt had risen to r.m.383,100,000,000. Italy, Japan and France all saw their national debt multiplied. The only large area of the world not subject to rising debt totals during the war period was Latin America. 94 Decorations, Military, Naval and Civil

Gen. George Washington established a new precedent in the awarding of decorations by creating the Purple Heart on Aug. 7, 1782. This apparently was the first time that a decoration was made available to non-officer, enlisted personnel in any army of the world. It is singular enough that there was a record of only three awards—all to sergeants.

This original Purple Heart went into disuse and it was not until the 200th anniversary of the birth of Washington on Feb. 22, 1932, that announcement was made of the decoration's revival. The new decoration consisted of a bronze metal pendant with a purple coloured heart on which was imposed a profile of Gen. George Washington in military uniform. Above the heart was the shield of Washington's coat of arms between two sprays of leaves in green enamel. On the reverse, below the shield and leaves, without enamel, was a raised bronze heart with the inscription "For Military Merit." The ribbon was designed in purple with white edges.

On Jan. 28, 1940, Brig. Gen. William H. Bisbee was awarded a Purple Heart on his 100th birthday for "outstanding service in the Union Army from 1861 to 1865." This was the only award of this decoration for service during the Civil War.

The Purple Heart later was awarded by the war department to those who were wounded, or posthumously to those killed, as a result of enemy action on or after Dec. 7, 1941. On Dec. 3, 1942, an executive order was issued by the president whereby the secretary of the navy was

authorized also to award this decoration to persons in the navy, marine corps and coast guard who were wounded in action against an enemy of the United States.

One of the most outstanding awards of this decoration posthumously was made to Mr. and Mrs. Thomas F. Sullivan of Waterloo, Ia., who on Jan. 25, 1944, were presented Purple Hearts for the loss of their five sons during World War II.

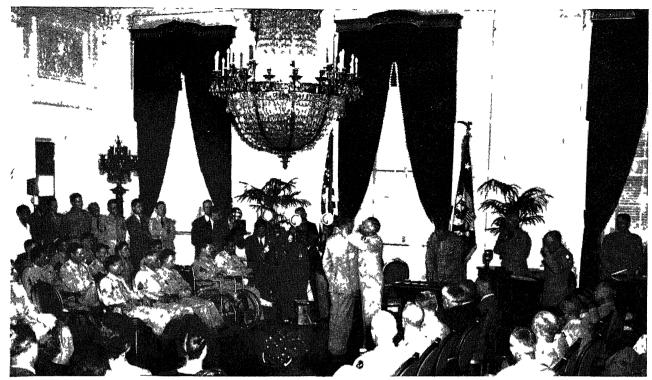

In 1918 the U.S. congress had established a three-sixteenths inch silver citation star prescribed to be worn as the president might direct. This star was placed on the ribbon of the service medal for the particular war in which the individual served. It was discontinued in 1932, to be worn in this manner; at the same time it was directed that it would thereafter be within a wreath on a larger bronze star. The reverse was to be inscribed with the words "For Gallantry in Action" and the name of the recipient. This bronze star was suspended from a ribbon of five equally divided stripes of blue, white, red, white and blue between narrow edge stripes of blue and white. First awards of the silver star to women were to three army nurses on March 17, 1944—2nd Lt. Rita Rourke, 2nd Lt. Arlitta Roe and 1st Lt. Mary Louise Roberts.

A marine corps reserve medal was authorized Feb. 19, 1939, to be worn as evidence of four years' service in the organized marine corps reserve. The obverse showed a marine and civilian walking and the inscription "Marine Corps Reserve" and "For Service." The ribbon was made of yellow with a red central stripe, each edge bordered red, white and blue.

Prior to World War II an individual was not authorized

Capt. Joseph J. Foss of the U.S. marines receiving the congressional medal of honour from President Roosevelt May 18, 1943, for downing 26 Japanese planes. With him were his mother (left) and wife

President Truman awarding the congressional medal of honour to 28 veterans of the European and Pacific theatres on Aug. 23, 1945. The White House ceremony was attended by relatives and high ranking officials of the army and navy

to wear a service ribbon to represent a service or campaign medal unless he was physically in possession thereof. However, because of the shortages of metals during World War II, authority was granted for an individual to start wearing a ribbon immediately after having qualified for the medal.

On June 28, 1941, the president authorized an American defense service medal for service in the army, navy, marine corps and coast guard during the limited emergency from Sept. 8, 1939, to the end of the unlimited emergency proclaimed May 27, 1941, which was later established as Dec. 7, 1941. The obverse showed Liberty in attitude of defense, holding a shield and sword and standing on live oak with branches terminating in leaves representing army, navy, marine corps and coast guard. For those in the army who were overseas a clasp for "Foreign Service" was authorized; those in the navy could wear a clasp with the word "Fleet" or "Base," while those on designated vessels in the Atlantic fleet could wear a bronze "A." Both services were authorized to wear a bronze star on the service ribbon to represent the clasps. The ribbon was golden yellow with narrow stripes of blue, white and red near each edge.

On the same day the president authorized the army to have a good conduct medal to be given enlisted personnel for three years' service in peacetime or one year's service during wartime for exemplary behaviour, efficiency and fidelity. The medal has an eagle standing on a closed book and sword, showing the close of a military period of service, inscription, "Efficiency, Honor, Fidelity." Reverse shows a star above a scroll between the words "For Good" and "Conduct" within a laurel and oak wreath. The ribbon was designed in red with white stripes, making 13 in all. The award was authorized for members of the Women's Army corps in 1944.

On Nov. 21, 1941, the army of occupation of Germany

medal for World War I between 1918 and 1923 was authorized. The first issue of this medal was made to Gen. John J. Pershing, whose profile appeared on the obverse of the medal; the ribbon was black edged with blue, red and white.

On Feb. 26, 1942 (amended Nov. 22, 1943), the president authorized award of the army distinguished unit badge consisting of a blue ribbon worn within a gold frame. A presidential unit citation for the navy was also authorized on Feb. 26, 1942, consisting of a horizontally striped ribbon blue, gold and red in descending order.

The legion of merit in four grades was authorized by congress July 20, 1942, for award to personnel of armed forces of friendly foreign nations and personnel of armed forces of the U.S. and Philippines who had distinguished themselves by exceptionally meritorious conduct in the performance of outstanding services after Sept. 8, 1939.

The air medal was authorized by the president on May 11, 1942, and first awards were made in 1943.

Aug. 7, 1942, congress authorized the president to present, but not in the name of congress, a navy and marine corps medal to those who had distinguished themselves by heroism not involving actual conflict with an enemy.

The merchant marine distinguished service medal was authorized April 11, 1942, for those in the merchant marine who on or before Sept. 3, 1939, distinguished themselves in the line of duty. The merchant marine combat bar consisted of a horizontal light blue and dark blue ribbon separated by a red stripe edged in white; if the crew member was forced to abandon his vessel a silver star is placed in the centre of the ribbon.

A medal for merit was authorized by congress June 20, 1942, to be awarded to civilians of the U.S. who distinguished themselves by exceptional meritorious conduct in the performance of outstanding services. This was the civilian counterpart to the Legion of Merit.

Congress authorized the mariners medal on May 10, 1943, for those serving on any vessel in the American merchant marine during the war period, who were wounded,

suffered physical injury or suffered through dangerous exposure as a result of an enemy of the U.S. The obverse was an eagle on an anchor in silver on a cross of Malta. Reverse showed a hand carrying a torch with a wreath and waves, inscription "United States Merchant Marine." Ribbon, red and blue with a narrow centre white stripe.

The bronze star medal was created for both the army and navy on Feb. 4, 1944

The navy established its commendation ribbon in 1944. The army created a meritorious service unit plaque for organizations in 1944.

The United States of America Typhus commission medal was authorized Dec. 24, 1942, but was not struck until 1944.

The combat and expert infantryman badges were created along with miniature aviation badges for wear on shirts; the gliders badge and divers badge were also created in 1944.

In 1944 the design of the Women's Army corps medal was selected but was not struck until 1946. The obverse shows the head of Pallas Athene in front of a sheathed sword and palm branch surrounded by the inscription "Women's Army Corps." The ribbon, "mosstone green," is edged with "old gold."

The lapel button for service subsequent to Sept. 8, 1939, was selected in 1944 and made of gold plated plastic, but when metal was available in 1946, gold plated bronze was used.

The bronze service arrowhead was authorized for wear on the appropriate theatre ribbon in 1944 to represent an amphibious assault or parachute landing behind enemy lines.

"Just Gimme Th' Aspirin. I Already Got a Purple Heart," Sergeant Bill Mauldin's version of the U.S. soldier's attitude toward the frequently awarded decoration. Mauldin drew his series, "Up Front with Mauldin," for the army newspaper Stars and Stripes at the bottle fronts of World War II

Congress also authorized a victory medal for World War II. Announcement was made on Oct. 25, 1945, by the war department describing the ribbon as two double rainbows in juxtaposition separated by a central band of red bordered in white. The medal design was selected in 1946 to be "Liberation," standing on a war god's helmet, crushing it back into the earth, holding a broken sword of tyranny in her hand and looking toward the dawn of a new day with an inscription "World War II."

The president on July 6, 1945, authorized a "medal of freedom" for those who performed a meritorious act or service which aided the U.S. in the prosecution of a war against an enemy or enemies. It showed the head of "Freedom" taken from the pinnacle of the capitol of the U.S. The ribbon, red with four white pin stripes representing the four freedoms. Congress authorized a selective service medal on July 2, 1945, for those who gave their services to draft boards, etc., for which no compensation was made. The obverse showed the seal of the Selective Service system. The ribbon, blue and yellow stripes. First awards were made by the president Jan. 21, 1946.

The coast and geodetic survey was authorized on July 21, 1945, by congress to create six ribbons for distinguished service, meritorious service, good conduct, Atlantic war zone, Pacific war zone and defense service.

The war department announced Dec. 18, 1945, the army commendation ribbon, consisting of 13 green and white stripes. An exceptional civilian award decoration was approved Dec. 29, 1945, and a badge for medical corpsmen was authorized July 28, 1945.

An executive order of Nov. 6, 1942, originally authorized the creation of ribbons and medals for three theatres during World War II. The medal designs were under consideration in 1946. The ribbons adopted were as follows:

American campaign—blue for the Americas, with black and white stripes near each edge representing the German part of the conflict on the Atlantic, and red and white stripes the Japanese part of the Pacific.

European-African-Middle Eastern campaign—brown for the sands of Africa on each edge, green in central section for the fields of Europe, green, white and red stripes near one edge—the Italian part; white, black and white stripes near the other edge—the German pact.

Asiatic-Pacific campaign—orange background with white and red stripes representing Japan.

A blue, white and red stripe in the centre of each ribbon-U.S. colours-showed all the service was concurrent. (A. E. Du.)

Great Britain and Commonwealth.—The main additions after 1937 to the list of British orders, decorations and medals for personal gallantry were the George cross (ribbon: garter blue, with a replica of the cross in silver when worn in non-dress) and George medal (red with five narrow stripes of blue), established in Sept. 1940. Intended primarily for civilians, men and women, they were also awarded to members of the fighting services, and could be awarded posthumously. The former was granted "only for acts of the greatest heroism, or of the most conspicuous courage in circumstances of extreme danger," and the G.M. in similar circumstances where the services were not so outstanding, but were still of a very high standard. (The G.C. superseded the medal of the Order of the British Empire "for gallantry," leaving the British Empire medal, military or civil, for award to members of the armed forces or civilians for meritorious service in peace or war.) On April 18, 1942, a new precedent was created when the George cross was awarded to the island of Malta in recognition of the epic resistance of its beleaguered population.

Early in World War II the naval distinguished service cross, previously awarded to officers of and below the equivalent rank of lieutenant commander, was made available to commanders. Personnel of the merchant navy were made eligible for the D.S.O., D.S.C., the naval conspicuous gallantry and distinguished service medals, for gallantry or meritorious acts while serving in close contact with the royal navy.

A new conspicuous gallantry medal (pale blue with dark blue edges) was established for airmen for acts of outstanding courage during air operations.

The king's medals for courage (ribbon: white, broad red edges with two narrow central stripes of blue) and for service (white, with a narrow central stripe of red and narrow stripes of blue towards each edge) were instituted in 1945 for Allied or other foreign persons, mainly civilians, without distinction of status or rank. The medal for courage was for those who helped members of the British forces to escape from, or to evade, the enemy, or for other services involving risk to life or danger in hazardous circumstances, and that for service for outstanding civilian services in a variety of ways.

Instituted during the war were the order of Burma (ribbon: green with pale blue edges), in one class, and the Burma gallantry medal (green with central stripe of crimson). With the king's approval, Canada in 1943 established the Canada medal (red, white and red) for meritorious service above and beyond faithful performance of duty by citizens of Canada and Allied nations, and the Canadian service medal (dark blue flanked by stripes of red with green edges, and silver maple leaf worn on the ribbon by those who served outside Canada) for all men and women who served in the armed forces of the dominion. The Africa service medal (orange flanked by stripes of gold with green edges) was similarly instituted in 1943 for all members of the Union defense forces attesting in Africa before May 13, 1943, the date of the axis surrender in Tunisia.

The following British stars and medals for war service in the armed and other forces and services in World War II were instituted (ribbon colours follow in brackets): 1939-45 star (three equal bands of dark blue, red and light blue); Atlantic star (blue and green shading centrally into white); air crew Europe star (pale blue, edged with yellow and flanked with black); Africa star (red band on buff background, flanked on one side by a dark and on the other by a light blue stripe, with clasp numeral "8" or "1" for service with eighth or first army and silver rosette for service with royal navy, R.A.F. or merchant navy); Pacific star (green band on red, centred with a yellow stripe and edged on one side with a dark and on the other with a light blue stripe); Burma star (red, flanked on either side by equal stripes of dark blue, orange and dark blue); Italy star (equal bands, red, white, green, white, red); France and Germany star (equal bands, blue, white, red, white, blue); defense medal (red, flanked on either side by a green band containing a black stripe); India service medal (dark and light blue); war medal 1939-45 (red, white and

The 1939-45 star (originally 1939-43) was first awarded for service with the British expeditionary forces in France, Belgium and Norway in 1939-40, and for service in subsequent commando and special operations not covered by the Africa star; later it was awarded for six months' service in any overseas operational theatre. Qualifications for the defense medal were three years' service with the forces in nonoperational areas open to air attack, or with the civil defense or other specified service (home guard, coast-guard, civil nursing reserve, etc.) in any area threatened

from the air; or one year's nonoperational service with the forces overseas.

A bronze oak leaf was instituted for mention in dispatches, and the king's commendation emblem for civilians for brave conduct.

Belgium.—World War II decorations comprised the croix de guerre (1940); croix des evadés; croix de la résistance; médaille de la résistance; a volunteers' 1940-45 medal, and a war commemorative medal.

Czechoslovakia.—Established during World War II were the war cross (1939) and medal for bravery (1940).

France.—General de Gaulle established in 1941 the ordre de la libération, and in 1943 the médaille de la résistance Française.

Greece.—The royal order of George I, with its crimson ribbon, established in 1936, is awarded in five classes in military and civil divisions, with and without swords; the war cross, 1940–44, in three classes (1ibbon: three equal stripes of red, blue, red). Distinguished conduct medal. 1940–44 (orange moiré with black stripes towards each edge).

The Netherlands.—The following decorations were established during World War II: bronze cross (1940) for gallantry in action; good service cross (1941) for courage of a nonmilitary character in connection with enemy action: flying cross (1941) for gallantry in the air; bronze lion, for honourable mentions; commemorative cross of the war, equivalent to a campaign medal or star.

Norway.—The War cross (1941) for conspicuous bravery in action and the war medal (1941) for meritorious service in war were instituted.

Poland.—The Grunwald cross, a military decoration in three classes, a medal for service in the field, the partisan's cross and a medal for Polish troops in action at Monte Cassino, Italy, were established.

U.S.S.R.—In addition to the various awards, with badges, available to citizens, soldiers, sailors and airmen of the U.S.S.R. before the war with Germany, the following awards, with ribbons, were established during the course of World War II, for war services: order of victory (1943), one class only and the highest military decoration; order of Suvorov (1943) three classes; order of Kutuzov, three classes; order of Alexander Nevsky (1942) one class; order of glory (1943) three classes; order of the patriotic war, two classes; order of Ushakov, two classes and a medal; order of Nakhimov, two classes and a medal; order of Bogdan Khmelnitsky, two classes and a medal; medals for valour; for distinguished service in battle; guerrilla service; distinguished industrial services; labour distinction; for defense of Stalingrad, Odessa, Leningrad, Moscow and Sevastopol; in addition together with a series of "motherhood decorations" instituted in 1944: motherhood medal, two classes, for five or six children; order of motherhood glory, three classes, for seven, eight or 9 children; order of heroine mother, for ten children.

Germany.—The highest German decoration under the nazi regime was the *Deutsches kreuz* with two classes, gold and silver, no ribbon. The first was awarded for courage in the face of the enemy, the second for "leadership of men" not in action. The badge was in the form of a metal star, with a swastika in the centre surrounded by rays. It was worn like the star of an order. The iron cross, founded in 1813, and used in the wars of 1870–71 and 1914–18 with its black ribbon with broad white stripes toward each edge, was revived by Adolf Hitler on Sept. 2, 1939, for gallantry in action. The new ribbon had a broad red cen-

tre bordered by stripes of white with black edges, the decoration itself being a Maltese cross of black iron edged with silver bearing the swastika in the centre and the date "1939" on the lower limb. There were various degrees, starting with the lowest, second class, worn on the breast from the ribbon; first class, a slightly larger badge without ribbon worn on the breast like the badge of an order (bars, in the form of a silver nazi eagle and swastika over the date "1939" could be awarded with the second and first classes for a second act of bravery) and knights' cross, a larger cross worn round the neck from the ribbon. Still higher awards, with the cross embellished as described and worn round the neck, were the knights' cross with oak leaves, knights' cross with oak leaves and swords, knights' cross with oak leaves, swords and diamonds. The Iron cross, grand cross, the highest grade of all, was granted only once during World War II, to Hermann Goering after the surrender of France in 1940. Instituted during the war was the war merit cross (ribbon: black centre, bordered by stripes of white and red), inferior to the iron cross. It was in two classes, silver and bronze, and was granted with or without swords for services in action or otherwise.

Germany had a cross of honour for the Spanish campaign, 1936, with no ribbon and worn like the badge of an order.

The four classes, bronze, silver, gold and gold with diamonds, were awarded by rank. The nazi government awarded various medals, among them the *Anschluss* medal, for the occupation of Austria, 1938 (red bordered by stripes of black with narrow white edges); the Sudetenland medal, for the occupation of the "Sudetenland," 1939 (black, red, black in equal stripes); the protectorate medal, for the occupation of Bohemia and Moravia, 1939, which was the same as the last-named but worn with a clasp.

The gold badge of the National Socialist party, indicating membership of the party before Jan. 30, 1933, could be worn in uniform, though the ordinary party badge could not.

The blood order, awarded to Hitler's adherents who took part in the abortive *putsch* in Munich in 1923, had a ribbon practically the same as that of the iron cross.

Italy.—Apart from the orders and medals already in existence at the end of World War I, Italy had established a medal for aeronautical valour for personnel of the air force; it corresponded to the medal for military valour of the army and navy, and had three classes—gold, silver and bronze—with a ribbon of bright blue *moirė* with two scarlet stripes toward each edge.

There was also a bronze cross for military valour, a lower grade than the bronze medal of the same name, but worn with the same blue ribbon, and a cross for merit in war (ribbon: dark blue, with two broad white stripes toward the centre).

A profusion of medals were established during Benito Mussolini's fascist regime, among them the following: march on Rome, 1922 (half dull crimson, half yellow); United Italy, 1918–22 (green centre, with broad edges of white and red); fascist medal, 1920–23 (black, with edges of green, white and red); fascist bronze cross, for ten years' service in fascist militia (same ribbon as the medal); fascist medal, purpose unknown (black with central stripe of green, white, red); for service to fascist youth movement (claret, with central stripe of green, white, red); maternity and child welfare (white moiré); medal for parents of those killed in action (gray, with central stripe of green, white

and red).

Italian war medals included the following: Abyssinian campaign, 1935 (nine equal stripes of blue and black); volunteers' medal, Abyssinia (claret, blue centre with two black stripes). A number of medals were struck for service in the Spanish civil war, 1936-39, some being awarded by General Francisco Franco. Italy issued a bronze medal for the occupation of Albania in April 1939, with a ribbon of 18 narrow black and red stripes. During the period Italy was allied with Germany (1940-43), medals were issued to commemorate the occupation of Dalmatia, 1941 (black, with edges of narrow stripes of red, yellow, blue, yellow and red); Greece, 1941 (seven alternate stripes of blue and white); Greek campaign, 1940-41 (equal stripes of blue, red, white, green, red, white, green and blue); bronze medal of 1941, bearing the effigies of Mussolini and King Victor Emmanuel with Italian inscription to the effect that the war would continue until the final victory of the axis allies (dark blue, flanked by the green, white and red of Italy, and the red, white and black of Germany). The most interesting medal of all, however, was that struck for the campaign in Africa, which was to have been awarded to the German and Italian troops on their triumphal entry into Cairo.

The ribbon was in five equal stripes of green, white, red, white and black, the colours of Italy and Germany. The obverse of the medal showed two knights in armour (Germany, Italy) standing on the forepaws of a helpless crocodile (the British empire) and forcibly closing its jaws (the Suez canal).

On the reverse was a triumphal archway over a reefknot, with the fasces on one side and the swastika on the other. Round the edge in both languages—"German-Italian Campaign in Africa."

The symbolism was premature.

Degrelle, Léon Marie Joseph Ignace

Degrelle (1907—), Belgian politician, born of wealthy parents, was educated at Louvain university. He practised law and in 1935 formed within the Catholic party the "Rex" (originally Christus Rex) movement. A pro-fascist organization, the Rexists entered politics and won 21 seats in 1936, thanks to propaganda and funds suspected to be of German origin. In March 1937, Degrelle, in a move to test his popularity, ran for parliament against Paul van Zeeland. He was defeated by 275,840 votes to 69,242.

Arrested in May 1940 when German armies invaded Belgium, Degrelle was transferred to a prison in France. He was released after the armistice of June 22, 1940, and returned to Belgium. Thereupon, he joined the German army, serving as a lieutenant on the eastern front. He later returned to the reich.

In 1945, Degrelle fled to Spain where he was interned in San Sebastian. Belgium's request for his extradition was at first ignored by Spain, although later the Madrid government informed the Belgian ambassador that Degrelle had escaped from custody and had "disappeared." The Belgian government filed a complaint before the United Nations (Oct. 16, 1946), that Spain had refused to give it any information as to Degrelle's whereabouts.

Delaware

A state of the middle Atlantic seaboard and one of the 13 original colonies, Delaware is popularly known as the "Diamond state" and also known as the "First state" because it was the first to ratify the federal constitution (Dec. 7, 1787). Area 2,399.2 sq.mi., including 437.5 sq.mi. of water. Population (1940) 266,505, of which 139,432 were urban and 127,073 rural. Native white numbered 215,695; foreign born 14,913; Negro 35,876.

The principal city is Wilmington, 112,504; the capital is Dover, 5,517. In 1944 the civilian population was estimated at 283,802.

Richard C. McMullen was inaugurated as governor in Jan. 1937, the first Democrat to hold that office since 1901. A legislative act was passed in 1937, proposing a constitutional amendment for the reorganization of the state judiciary, including the creation of a supreme court of three justices, and the consolidation of civil and criminal courts. On Dec. 7, 1937, the state celebrated the 150th anniversary of its ratification of the federal constitution.

An important event in the state in 1938 was the Tercentenary celebration which marked the 300th anniversary of the landing of the Swedes and Finns in America on March 29. On June 27 the Crown Prince of Sweden and President Roosevelt were present for the unveiling of a monument given by the people of Sweden, commemorat-

The Delaware tercentenary in 1938 was observed by special festivities climaxed by the unveiling of a gift monument from Sweden at Fort Christina State park, commemorating the founding of the colony of New Sweden. The Crown Prince of Sweden is shown on his arrival for the unveiling ceremonies

ing the landing and founding of the colony of New Sweden. The year also marked the bicentennial of the establishment, at Wilmington, of the first Friends meeting-house. In the November elections of 1938 the Republicans gained control of the house, retained control of the senate and elected George S. Williams as United States congressman.

The legislative session in 1939 was marred by conflict between a Republican legislature and the holdover Democratic administration. The Republicans gained control of the election machinery of New Castle county by legislation passed over Governor McMullen's veto, and, after legal action, of the politically important highway department. Demands were made for the repeal or enforcement of the state's "blue laws," following a veto in April of a measure authorizing Wilmington to legalize Sunday movies. Surveys in Wilmington during the summer revealed that hundreds of technical violations occurred every Sunday.

In the presidential election of 1940, Roosevelt received 74,599 votes; Willkie, 61,390, with 51.1% of the voters (fourth highest in the nation) going to the polls. The Democratic candidates won all state administrative offices except the governor's, and Delaware's Washington delegation became entirely Democratic for the first time after 1919.

The Republicans, however, retained control of the state legislature and although Governor McMullen (Dem.) was slated to succeed himself, poor health obliged him to withdraw and Republican Walter W. Bacon, mayor of Wilmington, was elected.

Measures passed by the 1941 legislature included a Fair Trade act, permitting manufacturers to set minimum resale prices for trademarked commodities; acts for permanent automobile registration; repeal of the old "blue laws" forbidding worldly labours and amusements on Sunday; an improved workmen's compensation law; and new regulations regarding registration and election officials.

(H. C. RD.; X.)

The 1942 election was won by the Republican party. C. Douglass Buck replaced Senator James H. Hughes and Earle D. Willey won over Dr. Philip A. Traynor for representative. Senator James M. Tunnell, Sr. (Dem.), a holdover, was the other congressional delegate for Delaware. The state offices of attorney general, treasurer, auditor, insurance commissioner and nearly all county offices were won by the Republicans, who also remained in control of the legislature. By the end of 1942, 14,000 persons from the state were in the armed forces and 100,000 were engaged in civilian defense. The vital Wilmington area was filled with workers building ships, planes and other military products, military zones and dimout areas were set up, and living costs increased sharply.

In 1943 the state legislature was in session from Jan. 4 to April 9. Important legislation included the establishment of a state guard, the conferring of emergency powers upon the governor, and creation of a state soil conservation commission. Activities of the civilian defense organizations reached their peak in 1943; factories of the state continued production of war materials at a high rate, and retail and wholesale business increased an estimated 15%.

In the November elections of 1944, the state polled 126,423 votes or 68.7% of the registered voters. Roosevelt received 68,166 votes; Dewey, 56,747. Walter W. Bacon was re-elected governor by a plurality of 1,673. Earle D. Willey (Rep.), incumbent, was defeated by Philip A.

Traynor (Dem.) for congress. The state offices of lieutenant governor, treasurer and auditor were won by the Democrats. Governor Bacon's administration was supported by a legislature in which the Republicans had a controlling number of seats in both the senate and the

Beginning in January, the 1945 legislature met for 60 legislative days. Outstanding legislation included modification of election and banking laws, establishment of the family court, creation of a state pension system, and a measure providing for a Delaware crossing. Charles S. Richards became chief justice of the supreme court and James B. Carey succeeded him as resident judge. Soon after V-J day, the state council of defense and other war agencies terminated their work and Fort Dupont and Fort Delaware, which had maintained surveillance over the Delaware river shipping area, were closed by the war department. Factory employment after V-J day dropped 22% and pay rolls decreased about 18%, most of the decrease occurring in the shipyards and machine shops of Wilmington. Retail and wholesale sales were ap-

proximately 10% and 5% greater, respectively, than in the previous year. Marriages and deaths in the state were not as great as in the previous year, but the birth rate increased 5% in 1945. (L. D. V.; X.)

At the general election in Nov. 1946, Republicans were elected to congressional and state offices. The total number of voters was highest for the office of U.S. senator, 113,533 of a total of 169,703 qualified voters. The following were elected: U.S. senator, John J. Williams; U.S. representative, J. Caleb Boggs; attorney-general, Albert W. James; state treasurer, Benjamin F. Johnson; state auditor, Benjamin I. Shaw; insurance commissioner, William J. Swain. Gov. Bacon, Secy. of State William J. Storey and State Tax Commissioner Pierre S. du Pont continued in office. The state legislature of 52 members was composed of 35 Republicans and 17 Democrats. (J. En.)

Delbos, Yvon

Delbos (1885-), French statesman, was educated at the Ecole Normale in Paris. After completing his studies, he entered journalism, founding the Radical-Socialist newspaper, L'Ere Nouvelle. Elected on the Radical-Socialist ticket as deputy for the Dordogne department in 1924, he subsequently held a number of cabinet posts in the government. He was foreign minister in Léon Blum's government, 1936-37, and the succeeding Chautemps cabinet, 1937-38. The keystone of Delbos' policy was Anglo-French amity, and he frequently stressed its necessity. Delbos, who was minister of education when Reynaud reorganized his cabinet, June 5, 1940, bitterly assailed the rampant "defeatism" prevailing in the Reynaud government; he maintained that France could still carry on the war with her fleet and from the African colonies. One of the ministers in the Pétain government that opposed the armistice, he was arrested in 1943 and sent to a prison camp in Germany. He was freed in 1945 by Allied armies.

Democracy

Few political concepts were as much discussed, attacked and differently interpreted during the ten eventful years 1937-46 as the concept of democracy. Democracy may mean verbatim "the rule of the people," meaning the rule of the majority. In that sense the totalitarian governments, both communist and fascist, could claim, and did claim, to be "true" democracies. Their governments proved by almost unanimous plebiscites that they truly represented not only the will of the majority but the will of such an overwhelming majority that it amounted almost to the totality of the people.

Democracy, as it developed in 17th century England,

in 18th century France and above all in the United States, and as it was recognized everywhere in the 19th century, implies two indispensable elements: as a technique of government it is based upon freely elected representative institutions in which the opposition is unfettered and accepted as a constructive element, and decisions are arrived at by discussion and compromise; and in its fundamental assumption it is based upon the liberty of all individuals, including above all the freedom of thought and expression, and an attitude of mutual tolerance. The totalitarian governments of the 20th century rejected these two indispensable elements of democracy. They regarded democracy as a hypocritical pretense devised in the interests of certain classes or nations. At the same time they regarded democracy as unable to cope with the complexities of 20th century life. They were convinced that democracy was doomed, and that its methods were obsolete and its adherents decadent. They expected that democracy would perish by its own inner tensions, discords and conflicts. They opposed to it the alleged harmony of a monolithic society in which class or racial conflicts were eliminated and which was held together by an allegiance to only one class or only one race. While the democratic states were in theory above class or race, the totalitarian states in theory identified the state with one class or one

At the end of World War I democracy seemed to gain everywhere, except in the U.S.S.R., where Lenin's revolution of Nov. 1917 had established the first totalitarian regime. Even in Germany and throughout central Europe democratic republics replaced conservative monarchies. Japan, under the influence of the general trend, made definite progress toward democracy after 1918. But in Italy fascism under Benito Mussolini established between 1922 and 1926 another totalitarian regime which rejected democracy. By the beginning of the '30s, fascist regimes were established in several other countries, especially in Germany. Under their influence, other nations began to waver between democracy and fascism. By their self-confidence, aggressiveness, military preparations and controlled public opinion, totalitarian powers seemed superior to the democracies, the totalitarian methods more efficient than democ-

Democracy Disunited.—The democratic powers lost especially in the international field. Totalitarianism was encouraged by its successes, which were due to a large degree not only to the peaceful character of the democratic peoples but above all to the unwillingness of the democracies to co-operate in face of a threat to all democracy. After World War I, each democracy had thought only of itself and its own supposed interests. Great Britain and France no longer stood together; the U.S. retreated into an attitude of isolation and recrimination. Thus the democracies had to face again the challenge of an authoritarian bloc based upon unity achieved at the price of freedom. The reluctance of the democracies to establish a close co-operation or a union of the democracies endangered not only the national security of each democracy but also the cause of freedom and human worth everywhere. Britain and France found the unity of their strategic interests and predominant way of life only in the moment of supreme danger, too late to save France and almost too late to guarantee Britain's survival.

In that situation in June 1940, the British government submitted to the French an official proposal for a union of the two democracies. "At this most fateful moment in the

history of the modern world," the proposed declaration read, "the governments of the United Kingdom and the French Republic make this declaration of indissoluble union and unyielding resolution in their common defense of justice and freedom, against subjection to a system which reduces mankind to a life of robots and slaves. The two governments declare that France and Britain shall no longer be two nations but one Franco-British union. The constitution of the union will provide for joint organs of defense, foreign, financial, and economic policies. Every citizen of France will enjoy immediately citizenship of Great Britain, every British subject will become a citizen of France." This proposal was rejected by the French cabinet by a very slight majority.

In the pursuance of World War II, victory for the democracies was made possible by the close co-operation, amounting almost to a union in strategic and economic affairs, between the U.S. and Britain. Such a unity had never been achieved during World War I, not even in its last and most critical stage. It was the deep understanding of the U.S. general, Dwight D. Eisenhower, commander in chief of the armies of the democratic allies, for the need of unity among the democratic nations, based upon a common tradition, which made them such a powerful instrument for victory.

Yet in 1939-41 the fascist nations were confident of victory. They had prepared for the war for a long time and they had mobilized all their resources for waging it. They had placed "guns before butter" and had ridiculed the softness and liberties of the democracies. Russia under its totalitarian regime, fearful of war and distrustful of the outside world, had also been prepared militarily and psychologically for the possibility of approaching conflict for many years. Russia was supported in it by the immensity of its territory, the vast numbers of its population and the abundance of its resources. The democracies, on the other hand, were in 1939-41 prepared neither materially nor psychologically. The democratic peoples did not expect war; in fact they believed it impossible and inadmissible. Their economic life was entirely governed by the requirements of "butter before guns." In spite of this material and psychological unpreparedness, the democracies were able to stand the test of the ten eventful years.

In the material realm they were able, both in Britain and in the U.S., to create mighty armaments, equal in quality to the best produced in the totalitarian countries, where for many years many gifted brains had given their full attention to military science and technology. The quantity of output was so great that the two countries could supply Russia with many thousands of tanks and planes and vast amounts of various equipment. In the psychological realm democracy showed an astonishing resilience and unity. Neither in Britain nor in the U.S. did the nondemocratic elements-the fascists and, during the period of German-Russian friendship, the communistsseriously hamper the war effort or its preparation. Before 1939 the enemies of democracy and some of its pusillanimous friends had expressed expectation that in case of war democracy would be unable to maintain the civil and political liberties and would turn totalitarian. Nothing of that kind happened. On the contrary, the war effort invigorated the democratic consciousness and made it more vigilant.

In Britain and in the U.S. all the constitutional liberties were maintained during the war. The British house of commons, the mother of parliamentarianism and democ-

Democracy defined in terms of baseball, by George Clark of News Syndicate Co. Inc. The private to the captain: "Whatta ya mean, he's out? He was safe a mile!"

racy, continued to direct national existence and express the will of the people during the most tragic and trying hours of World War II. The rights of minorities and the freedom of opinion and expression remained safeguarded. This example strengthened and inspired democratic elements everywhere. On the whole, the totalitarian attacks against democracy led to a reappraisal and a reassertion of the fundamental attitudes and values inherent in the democratic position.

Two Small Lights.—In 1940 only two democracies remained on the European continent, Sweden and Switzerland. The seemingly overwhelming power of the totalitarian bloc in no way dimmed the democratic spirit in these two countries. The parliamentary elections held in Sweden on Sept. 15, 1940, brought that out clearly. In spite of the fact that a few months before, the two neighbouring Scandinavian nations, Norway and Denmark, had been occupied by Germany, and Finland had been defeated by Russia, the elections in Sweden proved a definite trend toward stronger democracy, even if compared with the last preceding election in 1936. The Swedish National Socialists, who in 1936 had received 26,750 votes, too few to gain a seat, did not participate at all in the 1940 elections. The Swedish Communists got only three instead of the five seats gained in 1936, while the largest democratic party, the Social Democrats, achieved for the first time the absolute majority in the Swedish parliament. In Switzerland an interesting indication of the strength of democracy was afforded in the general protest movement in parliament, in the press and among the people against the audience which the federal president had granted to the representatives of the "National movement," a Swiss National Socialist group. During 1942 the German propaganda minister had to protest again and again at the outspoken democratic sympathies of the Swiss and the Swedish

press, at a time when both countries were surrounded on all sides by the triumphant power of National Socialist Germany.

In 1943 the Danish people, though under German occupation for almost three years, gave a smashing demonstration for democracy in the parliamentary elections of March. More than 90% of the electorate voted, and the five democratic parties polled 362,000 more votes than in the elections of 1939. The greatest gain was shown by the Social Democrats, the strongest single party, and by the Conservative party, whose political leader and spokesman was then in Britain leading the fight against Germany. The two nondemocratic parties, the Danish National Socialist and the Farmer's party, received together only 68,000 votes out of a total of almost 2,000,000. Similar was the outcome of the elections in Switzerland in the fall of 1943. They brought a great gain to the Social Democrats, who for the first time became the strongest political party in the National council, having almost 25% more seats than in 1939. The two leading fascist organizations in Switzerland, the Nationale Gemeinschaft Schaffhausen and the Rassemblement Fédéral, were dissolved in July 1943 and their newspapers suppressed.

Of even greater importance as an indication of a swelling world-trend in favour of democracy were the elections held in July 1943 in the Union of South Africa. The democratic parties, which had supported the war from the beginning, received under the leadership of Field Marshal Jan Christiaan Smuts 107 seats while the profascist opposition, which had opposed South Africa's participation in World War II, received only 43 seats. While the democratic and prowar parties in the preceding parliament had a majority of only 18, they gained a majority of 64 in 1943. All cabinet ministers were re-elected, some with record majorities. The number of voters was unusually large.

Effect of the Axis' Destruction.—The collapse of fascism in Italy and the ignominious defeat of the Italian armies and havies, in spite of the Italian boasts about the newly acquired military efficiency and heroic attitude, and the victories of the democratic armies and of the soviet union further increased the prestige of democracy. At the same time the successful struggle of communist Russia paved the way for a spread of communist influence far beyond Russia's borders. The elections held in Sweden in 1944 bore out the trend. The Social Democratic party retained undisputed control of the lower house with 115 seats, though it lost several seats, as did the second largest party, the Conservative. These seats were gained by the Communists, who were in 1944 holding 15 seats instead of 3, the Agrarians and the People's party. The increased prestige of democracy was also seen in the praise bestowed upon democracy even by nondemocratic countries. Everywhere outside the fascist lands, democracy was recognized at least as a desirable goal. That was also the case in the soviet union and in China. Generalissimo Chiang Kaishek promised the introduction of constitutional liberties in China won during the war. In Brazil, President Getulio Vargas told a press conference on April 15, 1944, that after World War II, in which the Brazilians took an active part on the side of the United Nations, the Brazilian people would have the opportunity to choose their own democratic representative government. After 20 years during which, under incessant attacks from communism and fascism, the prestige of democracy was falling, the year 1944 witnessed everywhere a new rise in the appreciation of the results and benefits of the democratic way of life.

After the expulsion of the Germans in 1944-45, civil

liberties, equality of all before the law, and a due regard for objective justice were quickly re-established in the countries of western and northern Europe. In France, Belgium, the Netherlands, Luxembourg, Norway and Denmark the democratic institutions were again functioning in 1945. Greece enjoyed liberty of press and of assembly by the end of the year and in the elections of spring 1946 full freedom was assured by international democratic supervision.

Wherever such freedom of elections was assured and opposition candidates could present themselves at the polls, the elections confirmed everywhere the trend away from totalitarianism to democracy. This was the more remarkable because all these countries suffered from an unprecedented economic misery and from much administrative chaos in the wake of the long years of war.

Free elections in which opposition parties were represented were held in 1945 on the European continent in France, Luxembourg, Norway, Denmark, Finland, Austria and Hungary. In Norway and in Denmark, as in Great Britain, the moderate Socialist or Labour parties gained the strongest representation; in Norway the Labour party received the absolute majority and formed the government; in Denmark the bourgeois parties of the centre and the right received 83 seats against 47 for the Social Democrats and 18 for the Communists. In Luxembourg the Catholic party received most of the votes; together with the Social Democrats they had 34 out of 51 seats and formed the government. In Finland the bourgeois parties received about half the votes, the Social Democrats onefourth, and the Communists one-fourth. The same proportion prevailed in France, where the Communists, the Socialists and the Catholic Republicans (Mouvement Républicain Populaire) emerged as the three strongest parties.

In Austria and in Hungary the Catholic Agrarian parties received a clear majority of the votes and seats while the Communists lost heavily, especially in Austria. On the whole, the trend on the continent of Europe, wherever full freedom of expression and election existed, went to the two democratic parties of the centre, the Progressive Catholics and the Social Democrats.

In Britain the Labour party received 393 out of the 640 seats in the house of commons. The popular vote was not so overwhelmingly Labour as the distribution of the seats might suggest. Labour received 11,962,678 votes, the Conservatives 9,018,235 and the Liberals 2,280,135 votes. The extreme parties of the left made a very poor showing: Commonwealth received one seat and the Communists two seats, a gain of one.

The elections of 1946 in Europe, the principal battleground for democracy against totalitarianism, showed on the whole that there were three tendencies on the continent (outside Britain). To the extreme left were the Communists while among the democratic parties the Social Democrats and the Leftist Catholics predominated. In Belgium and the Netherlands, however, communism was weaker than in other continental countries, and the conservative parties strong. Elections were held for the Belgian chamber of deputies on Feb. 17. Of the 202 mandates of the chamber, go went to the Catholic party (as against 72 at the time of the dissolution of the preceding Chamber), 69 to the Social Democrats (as against 63), 24 to the Communists (as against 9), 18 to the Liberals (as against 31) and 1 to smaller groups (as against 5). In the Netherlands, elections were held on May 17 for the states general, the lower chamber, and on May 29 for

the upper house. Of the 100 seats in the lower house the Catholics received 32 seats (1,466,510 votes), Labour 29 (1,347,664), the Protestant parties 23 (1,121,153), the Communists 10 (502,935), the Liberals 6 (305,935). In the upper house the 50 seats were distributed in a similar way: Catholics 17, Labour 14, Protestants 12, Communists 4 and Liberals 3. In France the draft of the new constitution sponsored by the Communists and Socialists was rejected by the electorate in a referendum. In the elections for a new constituent assembly the Catholic party (the Popular Republican movement) emerged as the strongest single party and thus took the place which in the preceding elections the Communists had achieved. It was followed by the Communists, the Socialists, and finally the Liberal groups, which this time showed somewhat greater strength than in the preceding elections. This position was reversed in the elections of Nov. 1946 out of which the Communists emerged as the stronger single party followed by the Catholic Republicans. The Liberal parties also increased their strength.

Of great interest were the elections in Czechoslovakia at the end of May 1945. The Communists showed greater strength than in any other country with free elections. They received 2,695,915 votes or 38% of the total votes cast and 114 seats in an assembly of 300. Only in Slovakia, the eastern part of Czechoslovakia, did the Communists emerge as the second strongest party, preceded by the Slovak Democrats, who received 988,275 votes and 43 seats. The Czech Socialist party received 1,298,917 votes and 55 seats; the Catholic Peoples party 1,110,920 votes and 47 seats; the Social Democrats 855,771 votes and 36 seats.

In 1946 the first elections were held in the former fascist countries. In Italy the elections confirmed the Catholic party as the strongest single party. A referendum held at the same time resulted in a majority for a republican constitution for Italy and the end of the monarchy. In Germany the elections resulted in a victory for the Social Democrats and the Christian Democratic Union. Definite progress toward democracy was made in Japan and in the new Japanese constitution.

Democratic Party

The Democratic party marched up the U.S. political hill and down again in the period from 1937 through 1946. Its history during that decade was, in reality, the drama of one man. Rarely, if ever, had so attractive an actor as Franklin D. Roosevelt appeared on the U.S. stage. He attracted to his standard many elements which had shown scant interest in public affairs or which had usually aligned themselves with the Republican or minor party organizations.

When he died on April 12, 1945, to be succeeded in an hour of crisis by the far less dramatic and dynamic Harry

S. Truman of Missouri, the national organization which Roosevelt had thrown together and led to four presidential triumphs began to show signs of disintegration. Labour and liberal groups, as well as an estimated 10,000,000 independents, who had responded to his New Deal program and personality, deserted the Rooseveltless party.

The Dominance of Roosevelt.—With Roosevelt's reelection in 1936 by an electoral vote of 523 against only 8 for Alf Landon of Kansas, the Republican nominee who carried only Maine and Vermont, the Democrats enjoyed overwhelming control of the federal government, with the sole exception of the supreme court of the United States. The popular tally was 27,474,872 for Roosevelt and 16,679,983 for Landon.

The Democrats had such topheavy representation in house and senate in Jan. 1937 that majority members had to sit on the Republican side of the aisles dividing the national chambers. The G.O.P. had only 89 house members, 17 senators and 8 governors. Almost every city with a population of more than 100,000 was in Democratic hands. This almost unprecedented domination of the U.S. political scene was a tribute to Roosevelt's astuteness and appeal as well as to the organizing ability of James A. Farley of New York, his campaign manager as Democratic national chairman.

The sweep of Roosevelt's 1936 triumph had a definite effect upon him and his conduct of the government, especially in his relations with congress. He showed his elation even before the votes were cast. In his final campaign speech at Madison Square Garden on the Saturday night before election day, he warned that the forces of reaction would meet "their master in my second term."

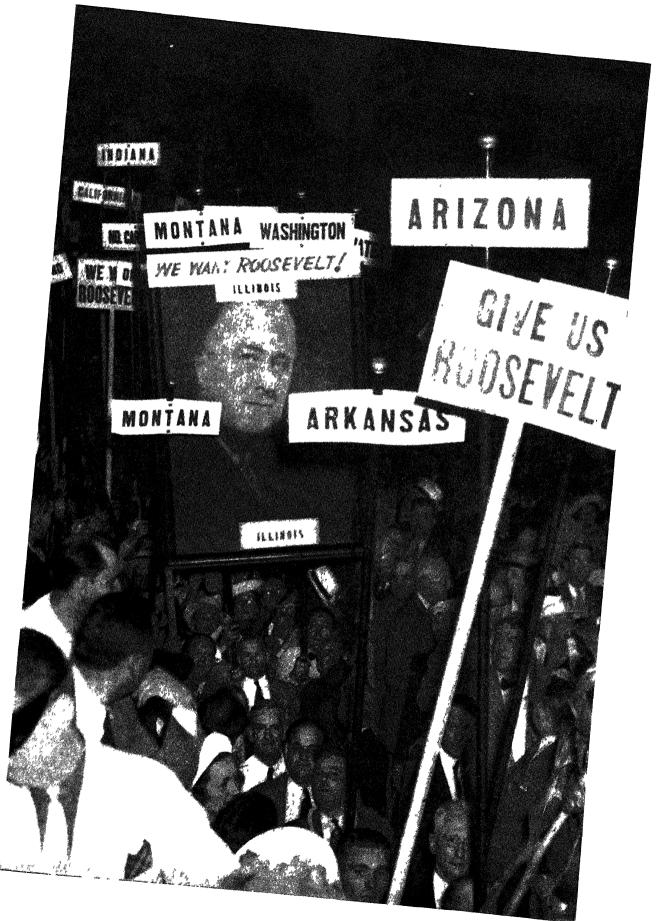

He soon exhibited his meaning. In Feb. 1937 he advanced a unique proposal for "packing" the supreme court by the addition of 6 members and a provision for retirement on pension of all federal jurists after serving 10 years and reaching the age of 70.

Democratic liberals and Republicans joined with Republicans in attacking this judicial reform. It never came to a formal vote in house or senate, and Roosevelt reluctantly withdrew it, although never admitting any error on his part. The retirement-pension feature was approved by congress, and it eventually contributed to the voluntary resignation of several elderly members who had voted to "kill" major Rooseveltian reforms, notably the National Recovery Act (NRA) and the Agricultural Adjustment Administration (AAA).

The president also tried to force through a federal wage-and-hour bill to replace the outlawed NRA, but congress refused to pass it. The legislators, with many Democrats voting against the White House, also blocked enactment of a measure authorizing the president to reorganize executive departments.

Presidential influence on Capitol Hill suffered from the death in July 1937 of Senate Majority Leader Joseph T. Robinson of Arkansas, an able and loyal administration spokesman. He was succeeded by Senator Alben W. Barkley of Kentucky, who enjoyed White House support in a leadership contest against Pat Harrison, a Mississippi veteran.

Reminiscent of his warning that he would be "master" in his second term, President Roosevelt sponsored a purge of Democratic legislators who had fought the more "liberal" of his proposed reforms. Marked by the White

House for defeat in the 1938 primaries were senators Walter F. George of Georgia, Ellison D. Smith of South Carolina, Millard Tydings of Maryland, Frederick Van Nuys of Indiana, Guy M. Gillette of Iowa and Alva B. Adams of Colorado. The only house member on the black list was Rep. John J. O'Connor of Manhattan, chairman of the rules committee, where many administration measures had been shelved. All save O'Connor, who won the Republican nomination but was defeated in the election, were renominated and re-elected.

In the elections of Nov. 8, 1938, the Democrats lost 8 seats in the senate, 81 in the house and many state and local offices, including 10 governorships. When congress convened in Jan. 1939, the Democrats had 69 senators and 262 house seats, a comfortable majority but less than the 75 and 333 who had represented the party in the upper and lower bodies, respectively.

The slight conservative trend evident in the 1938 contests, together with the politicians' resentment against the purge, was reflected immediately on Capitol Hill. With approximately 60 southerners siding with the Republicans, the legislators blocked major spending and public works measures, passed an emaciated government reorganization bill unsatisfactory to the White House and rejected a request for extension of the president's monetary control powers.

President Roosevelt called the legislators into special session on Sept. 13, 1939, within 13 days after Hitler's attack on Poland. With only a few dissenters, they passed a huge national defense program and repealed the Arms Neutrality law. For it, amidst sharp charges that "the President is leading us into war," they substituted a "cash and carry" system that favoured the Allies for the reason that only those nations could obtain the goods because of England's control of the seas.

Preoccupation with War.—The outbreak of World War II in Europe had a definite effect on the pattern of U.S. politics, as well as on Roosevelt's policies and strategy. Noting the slow growth of conservatism on domestic questions, the president abandoned controversial reforms to devote himself almost wholly to problems of war and foreign affairs. He set out to "rearm America" so that, as he said, the country would not become involved in the world-wide conflict. He assumed quickly and easily the role of commander in chief.

When the Democratic national convention assembled at Chicago on July 16, 1940, President Roosevelt's plans for a third term were apparently unknown. Indeed, Vice-President John Nance Garner of Texas and James A. Farley of New York, then Democratic national chairman and postmaster general, permitted their names to go before the convention. But the delegates suspected that Roosevelt was willing to run again, and they nominated him for a third term on the first ballot. Henry A. Wallace, then secretary of agriculture, was Roosevelt's own choice for vice-president, and despite some grumbling among regular Democratic leaders, the former Republican from Iowa was chosen. Farley resigned as national chairman in Aug. in a protest against the third-term try, and Roosevelt named Edward J. Flynn of New York, an oldtime friend, as his successor.

On Nov. 5, President Roosevelt was re-elected by 449 electoral votes to 82 for the Republican candidate, Wendell L. Willkie. The popular count was 27,243,466 for Roosevelt and 22,304,755 for Willkie. A tremendous turnout for the president in industrial districts, where employ-

ment and wages were reaching new highs, was chiefly responsible for his victory.

Entering the first war year of 1941, the Democrats continued in solid control of the legislative branch. Although losing 5 senate seats in the 1940 elections, and 7 in the house, their strength in the 2 chambers was, respectively, 66 and 267 seats. With the war engulfing 3 continents and moving ominously toward the western hemisphere through naval engagements between the belligerents, Roosevelt announced his determination to transform the United States into an "arsenal of democracy." On March 11, 1941, he obtained passage of the lend-lease bill. This arrangement permitted the Allies to buy munitions in the U.S. on credit and allowed their shipment overseas in U.S. vessels. Only 15 senate Democrats and 53 house Democrats voted in the negative.

He had more difficulty in persuading congress to extend the Selective Service bill, which had begun to provoke public resentment. It squeezed through the house in Aug. by the narrow margin of 203 to 202, with 182 Democrats and 21 Republicans voting in favour.

Partisan politics as they affected the conduct of the war were abandoned for the duration after Japan's bombing of Pearl Harbor on Dec. 7, 1941. Joseph W. Martin, Jr., of Massachusetts, Republican national chairman, and Flynn agreed upon complete co-operation in a Dec. 13 exchange of telegrams. Commenting on the arrangement, the Democratic national committee characterized it as "the most complete adjournment of domestic politics since the formation of the two-party system."

In view of this pact, Flynn incurred Republican wrath when he declared on Feb. 2, 1942: "No misfortune except a major military defeat could befall this country to the extent involved in the election of a congress hostile to the President." Roosevelt promptly softened that statement by explaining that what the country needed when at war was a congress which would support the government irrespective of party. In the 1942 congressional campaign he made no direct or general appeal for the election of Democrats.

On the ground that he was a resident of New York, Roosevelt intervened in that state. He announced his support of Senator James M. Mead for governor. This stand placed him in opposition to his old associate, Farley, who was backing Attorney General John J. Bennett. Although Bennett won the nomination, he was defeated by Thomas E. Dewey, the Republican candidate, by more than 600,000 votes.

Roosevelt encountered hardly any difficulty on Capitol Hill during 1942. The only administration measures meeting defeat were one empowering him to revise tariff and immigration statutes for the war period and another for outlawing state poll taxes. The latter proposal passed the house, but it was shelved in the senate by a filibuster of southern Democrats. All other measures, principally concerned with prosecuting the war, controlling the domestic economy and raising taxes, were enacted without serious opposition.

Setback.—Reflecting growing popular dissatisfaction with the administration's conduct of the war, as well as unrest over domestic irritations, the off year elections on Nov. 8, 1942, reduced Democratic strength in congress to its lowest point since Roosevelt had become president. The majority opened 1943 with only 57 senators and 222 seats in the house, an alignment that left it with only nominal control. Most of its losses were sustained in the agricultural states of the middle west.

Serious and numerous factional disputes marked the

legislative sessions in the 1943–44 period. Recalcitrance reached a new peak after a July-August recess among the home folks. Members found their constituents chiefly critical of "bureaucrats" management of emergency controls, especially the Office of Price Administration, huge expenditures and rising taxes and alleged coddling of labour. As 1943 ended, 40 to 60 southern Democrats were voting almost regularly with the Republicans on matters that did not relate to prosecution of military operations against the axis.

Flynn resigned as Democratic national chairman in Jan. 1943. He was subsequently named minister to Australia, but he asked the president to withdraw his name when it appeared that he could not be confirmed. It was generally believed that certain rebellious senators used the Flynn nomination as a means of expressing their growing irritation toward the White House. Postmaster General Frank C. Walker of Pennsylvania succeeded Flynn in the political post.

The year 1944 brought a virtual end to the political truce between the two major parties as they squared off for their first presidential joust in wartime. With Allied forces winning major victories on both European and Pacific fronts, restraints imposed during darker days were relaxed.

As in 1940, President Roosevelt gave no public sign that he would accept renomination for a fourth term. But Democrats, as well as the general public, took it for granted that he would run again. He was nominated on the first ballot at Chicago. He delivered his acceptance speech from the San Diego, Calif., naval base, explaining that he remained in public life against his own preference for retirement, and only because of the world crisis.

The surprise of the Democratic convention was the substitution of Senator Harry S. Truman of Missouri for Henry A. Wallace of Iowa as the vice-presidential nominee. Roosevelt expressed a mild preference for Wallace, but when the "big city" bosses—Flynn of New York, Frank Hague of New Jersey and Edward Kelly of Chicago—warned that the Iowan's "radical" views would alienate voters in their areas, Roosevelt gave the nod to Truman and to supreme court Justice William O. Douglas of Oregon. The delegates picked Truman.

He owed his selection largely to the efforts of Robert E. Hannegan, a fellow Missourian from St. Louis. Hannegan had succeeded Walker as national chairman in Jan. 1944, and he began at once to lay plans for making Truman the second man on the 1944 ticket.

President Roosevelt defeated the Republican nominee, Governor Thomas E. Dewey of New York, by an electoral tally of 432 for Roosevelt to 99 for Dewey. The popular vote was 25,602,646 against 22,017,592. The New York governor, however, proved to be the strongest opponent the president had met in a national contest.

In the congressional contests the Democrats gained 21 house seats and lost only 1 in the senate. They also won back the governorships of Ohio, Massachusetts, Missouri, Idaho and Washington. The opening of congress in Jan. 1945 found 57 Democrats in the senate and 243 in the house, as against 38 and 190 Republicans, respectively. There was 1 Progressive, Robert M. La Follette, Jr., of Wisconsin, in the upper chamber, and 2 members of minority parties in the house.

Although most of the legislation before the 79th congress consisted of noncontroversial measures dealing with postwar reconversion and demobilization, the Democrats managed to continue their bickering among themselves and with the White House. President Roosevelt con-

tributed his part to the intraparty duel; he buried himself so completely in naval, military and diplomatic problems that he lost touch with his leaders on Capitol Hill.

Revision of the revenue laws to simplify complexities precipitated the most bitter row between White House and congress since the 1937 supreme court struggle. In vetoing the measure because it provided only \$2,000,000,ooo instead of the requested \$10,000,000,000 in additional receipts, the president made a sharp comment on congressional inadequacy which stung the normally mild and loyal Alben W. Barkley of Kentucky, senate majority leader. In an angry retort, he declared that Roosevelt's estimate of prospective revenue had been prepared for him "by a mind more clever than honest," a not too subtle dig at Roosevelt's new crop of wartime advisers. Barkley resigned his leadership, but the special party caucus reelected him unanimously. The bill was passed over the veto and Roosevelt hastened to repair the breach by friendly advances to the amiable Kentuckian.

Another revolt against the White House was staged toward the end of the session by an odd assortment of Democratic liberals and conservative Republicans, when they objected to confirmation of several Roosevelt appointees to the reorganized state department. Such thick-and-thin supporters as Senators Joseph F. Guffey of Pennsylvania and Claude Pepper of Florida opposed Will L. Clayton, wealthy Texas cotton broker, for assistant secretary of state because they considered him a "reactionary." The G.O.P. members attacked Archibald MacLeish, poet of "social significance" and then librarian of congress, for a similar post because he was deemed a "radical." Both men were confirmed.

Truman's Succession.—The Democrats at Washington shifted from a warmaking to a peacemaking and reconversion program throughout most of 1945, with the defeat of Germany in May of that year and of Japan in August. They promptly discovered that postwar problems presented greater and more varied difficulties, politically, than defeating external foes. As the year ended, international differences and partisan divisions suppressed during the conflict beset Harry S. Truman, who succeeded President Roosevelt upon the latter's death on April 12, 1945.

Labour strife swept the nation, based on demands for higher wages, the release of federal controls and Truman's own statement that industry could absorb these extra costs without increasing prices. The administration's eventual approval of wage boosts averaging 18½ cents an hour, which resulted in general price inflation, sharpened public resentment by causing shortages and higher prices of commodities.

The prolonged legislative stalemate between White House and Capitol Hill gave deep concern to Democratic strategists, who conceded that the administration's apparent lack of accomplishments since V-J day, especially the failure to accelerate and promote orderly reconversion, might affect adversely their fortunes at the polls.

President Truman enjoyed a brief honeymoon because of the tragic circumstances under which he assumed office, but the old alliance between southern Democrats and reactionary Republicans was revived when he submitted his first legislative message to congress. Whereas they had expected him to lean toward the conservative side, he showed himself to be quite as "New Dealish" as his predecessor. They smothered in committee or defeated on the floor almost all his social and economic proposals.

The exasperated President Truman, whose friendliness and good nature had won him many friends when he served in the senate, eventually indulged in biting criticism of his erstwhile colleagues. On the radio and at press conferences he accused them of "letting him down" and of "stalling" on his recommended postwar program. His indictment did not improve relations, and his own leaders rebelled.

National Chairman Hannegan was especially disturbed by the legislators' refusal to approve "must" measures dealing with labour, economic and social welfare problems. He feared that congressional indifference and any evidence of presidential futility would alienate the conglomerate elements which had composed the Roosevelt New Deal party.

These fears were soon realized. Truman's inability to persuade or force congress to enact these reforms, his own proposal for a 30-day cooling-off period before calling of a strike, and certain prominent Democrats' antagonism toward unions produced the first break between a Democratic president and the Congress of Industrial Organizations in a decade. Philip Murray, C.I.O. president, characterized Truman as an "enemy of labor." John L. Lewis, head of the United Mine Workers, was even more caustic.

Subsequently, when the chief executive asked congress to pass a bill permitting him to "draft" trainmen in order to prevent a railroad strike, A. F. Whitney, head of the trainmen's brotherhood, vowed that he would spend all the money in his organization's treasury to defeat Mr. Truman if he sought re-election in 1948.

The Democratic leadership on Capitol Hill underwent a few changes when Truman quit the vice-presidency. Senator Kenneth McKellar of Tennessee was elected president pro tem of the senate. Senator Barkley of Kentucky remained as majority leader with Senator Lister Hill of Alabama as his assistant. Sam Rayburn of Texas continued as speaker of the house, with Rep. John W. McCormack of Massachusetts as floor leader. Rep. John J. Sparkman of Alabama was named as McCormack's aide.

Deaths, defeats and resignations in 1945 lowered the Democratic membership in both bodies. In the senate their number dropped from 57 to 56, while the Republicans increased from 38 to 39. The Progressives had 1 seat—Robert M. LaFollette Jr. of Wisconsin. In the house the majority lost 7 places, slipping from 243 to 236. The Republicans climbed from 190 to 192. There were 2 members of minority parties—1 Progressive and 1 American Labor—and 1 vacancy.

Battalions of Trouble.—Cabinet friction and resignations, Communist opposition from Moscow and fellow travelers in the U.S., strikes, rising prices, shortages of everyday goods, intraparty dissension—descended upon the Democrats in threatening panoply throughout 1946. Even his friends began to refer to the man in the White House as "poor Harry Truman."

When the president named Edwin W. Pauley, a California oil man, to be undersecretary of the navy, gruff Harold L. Ickes bluntly told the senate judiciary committee that Pauley had promised to collect more generous campaign funds if the secretary of interior dropped the government's suit to obtain jurisdiction over tideland oil property off the west coast. After an exchange of recriminations with Truman, Ickes resigned and became one of the administration's sharpest critics.

When Henry A. Wallace was asked to resign in Sept. 1946 as secretary of commerce, only one Roosevelt ap-

"Carrying Out the Roosevelt Policies." Darling of the New York Herald Tribune referred to the almost complete change in cabinet personnel under President Truman in 1945

pointee remained in the Truman cabinet—James V. Forrestal, secretary of the navy. Wallace was forced out because he expressed open and violent criticism of the Truman-Byrnes policy toward an increasingly recalcitrant Russia, which refused, in Washington's opinion, to honour pledges that Stalin had signed at Yalta, Tehran and Potsdam. Public reaction was extremely adverse to the Wallace viewpoint, and after a few days of hesitancy Truman dismissed him. Like Ickes, he became a frequent and vocal objector to the Truman program.

Numerous other Roosevelt followers—New Dealers, liberals, labour organizations and radicals—lined up against Truman, complaining that he had abandoned his predecessor's domestic and foreign policies. They also assailed many of his major appointments, insisting that they represented the ultraconservative wing of the party. Among those who fell away were James and Elliot Roosevelt, Henry Morgenthau, Fiorello H. La Guardia, and even Mrs. Eleanor Roosevelt now and then.

Strikes and work stoppages in the early spring of 1946 had an unfavourable effect on Democratic fortunes. They slowed down reconversion, caused scarcities of everyday goods and started a slow spiral of price inflation. Public discontent grew apace. A Gallup poll in early Oct. 1946, when the full force of delayed recovery had been felt by consumers, showed that Truman's popularity had fallen to 33% from the 87% high it had registered upon his entrance into the White House 18 months earlier.

As reflecting Truman's loss of favour, there sprang up throughout the nation many good-natured but sarcastic quips, to wit: "The Democrats' slogan should be 'two families in every garage'" (a reference to the housing shortage); "Haven't you had enough? Vote Republican"; "For horse sense, vote Republican. For horse meat, vote Democratic" (a reaction to the meat famine); "Hoover

promised us 'two chickens in every pot,' but Truman put them there."

Truman did not appeal for election of a Democratic congress, and took hardly any part in the congressional campaign. He did, however, sponsor an old-fashioned purge of Representative Roger C. Slaughter of the 5th Missouri district because of the latter's opposition to administration measures. Slaughter was defeated.

Price control and allied problems gave the Democrats their greatest difficulty in years. After an OPA-less period imposed by congress during July and August, federal ceilings were reinstated by Truman on Sept. 1. There followed a more severe shortage of meat and other foods than had prevailed even during the war. The president's own advisers urged him to intervene. For a few days he wavered, but he lifted the controls on meat and livestock on Oct. 14. On Nov. 9 he removed federal controls from all foods and beverages except sugar, syrups and rice.

In abandoning these forms of regimentation, and in adopting a more firm attitude toward Russia, President Truman had scrapped the major surviving features of the "Roosevelt New Deal," in the opinion of Roosevelt's friends and most neutral observers. It was generally believed that he and his advisers were seeking to respond to the more conservative spirit which swept the nation in the wake of depression, World War II and the slow, painful convalescence.

Rout.—Thus it was in a restless, critical and questioning mood that the voters went to the polls on Nov. 5, 1946, in the first major political test since the end of the war and President Truman's occupancy of the White House.

When the ballots were counted on election evening, it was plain that the people had "had enough" of more than 13 years of Democratic rule. The Republicans had won their greatest victory since Herbert Hoover defeated Alfred E. Smith in 1928.

The G.O.P. had been expected to gain control of the house, but they captured the senate as well. They increased their house membership from 192 to 246, as against 188 for the Democrats and 1 American Labor party man. In the senate they added 12 seats, giving them 51 to 45 for the Democrats. They raised their total of governorships to 25.

Democratic losses extended across the nation. They lost senate seats in Massachusetts, New York, Pennsylvania, Delaware, Ohio, Montana, Missouri, Utah and Washington. Of their 188 house members, only 72 came from outside the solid south and the border states.

A close survey of the returns showed that the great political organization built by Roosevelt had fallen apart, especially in the large cities which he had always carried. The reasons were obvious. The workers stayed away from the polls or voted Republican. Racial elements, alienated by the administration's earlier "appeasement" of Russia, and particularly by Truman's original endorsement of the Wallace speech, turned against the "ins." The Negroes returned to their old political homestead, disappointed at the failure of a Democratic congress to continue the Fair Employment Practices committee and abolish the poll tax. Liberals and independents, in the belief that Truman had abandoned New Deal principles, took little or no interest in the contest.

Subsequent polls by Dr. George Gallup and others showed that the Democratic slump began about mid-September, after the Truman-Wallace-Byrnes mixup, and gathered greater momentum after the president removed meat price controls on Oct. 14. These two incidents placed Truman in the light of an indecisive chief executive. Many Democratic leaders declared that they would

have retained slender control of congress save for these mishaps.

So disastrous was the defeat that Senator J. William Fulbright, Arkansas Democrat, urged Truman to permit the Republicans to take immediate charge of the executive as well as the legislative branch of the government. He proposed that the president name a Republican as secretary of state and then resign in favour of the cabinet member. Fellow Democrats branded the idea as absurd and Truman took no formal notice of it.

The Democrats made a few changes in organizing their senate and house commands for the 80th congress. Senator Alben W. Barkley of Kentucky shifted from majority to minority leader, but Senator Lister Hill refused to continue as whip. He was replaced by Senator Scott W. Lucas of Illinois.

On the house side former Speaker Sam Rayburn of Texas moved down to become minority leader, and Representative John W. McCormack of Massachusetts was chosen as assistant minority leader.

Speculation immediately arose on whether Truman would be a candidate to succeed himself in 1948 or step aside, in view of the 1946 "repudiation." It was generally agreed that he could have another try if he insisted, but he gave no sign of his future plans.

His postelection moves suggested that he had diagnosed the main causes of the Democrats' downfall and that he sought to remedy them. For one thing, he promptly removed ceilings from all foods except sugar, syrups and rice and promised a general lifting of other controls. At the United Nations assembly session in New York, Secretary Byrnes adopted a firmer attitude toward Russia. And when John L. Lewis threatened a soft coal strike in late November, President Truman met the challenge and decided not to accede to Lewis' demands.

Harry Truman was fighting back with characteristic courage and determination. But observers noted, ironically, that it was the first time the Democrats had been on the defensive since they won the house in 1930—16 years. (See also United States.) (R. Tu.)

Dempsey, Sir Miles Christopher

Sir Miles Dempsey (1896-), British army officer, was born Dec. 15, 1896 in Cheshire, England. He left the Shrewsbury school during World War I to join the Royal Berkshire regiment in 1915 as a second lieutenant. He served in France, Belgium and Iraq. A brigadier at the outbreak of World War II, Dempsey participated in the rear-guard action which enabled the British to evacuate the bulk of their troops from Dunkirk in late May 1940. Later promoted to a lieutenant general, he commanded the 13th corps of the British 8th army that chased Rommel across North Africa in late 1942. He also commanded British ground forces in the invasion of Normandy in June 1944, for which he was knighted. Sir Miles led the British 2nd army which, with the Canadian 1st army, helped to cut off the escape route for German armies in the Netherlands. In the spring of 1945, Dempsey's army had advanced deep into north Germany when the war

ended. Subsequently he went to the far east to take over command of the British 14th army in Aug. 1945; later that year he assumed command of Allied ground forces in southeast Asia. In Dec. 1945, he conferred with British officials in Batavia on the Indonesian revolt.

Denmark

A monarchy of north central Europe, Denmark has an area of 16,575 sq. mi.; its population was estimated to be 3,844,312 in 1940. Capital: Copenhagen (700,465). Other principal cities: Aarhus (99,881); Odense (87,521); Aalborg (55,652). Religion: Lutheran Christian. Ruler throughout the decade 1937–46 (since 1912): King Christian X (q.v.).

Precarious Neutrality.—When King Christian of Denmark celebrated the 25th anniversary of his reign, on May 15, 1937, he could look back upon a period of sound material and cultural progress among his people. But dark clouds were looming ahead. Naziism naturally was disturbing to a small neighbour state possessing only scant means of defense. Strong bonds united the northern countries, but in a military way all were weak, and the idea of a defensive union was, as Thorvald Stauning, the Danish premier, remarked on March 18, 1937, utopian. The defense system of Denmark was revised in 1937, and the war material had been modestly improved, but not so the manpower. The added improvements of the following years likewise remained modest and were confined to equipments.

During the spring of 1939 Germany invited Denmark to enter into a pact of nonaggression; this resulted in a ten-year agreement signed on May 31. But within a year thereafter, Germany was to break its agreement.

When World War II broke out in Sept., 1939, Denmark made a declaration of neutrality, mobilized its forces and engaged in widespread laying of marine mines. The neutrality, however, was soon broken by a British bomber which had strayed from its course and bombed the port of Esbjerg. One woman was killed, seven persons wounded and several houses damaged. The following months were marked by hundreds of violations of Danish neutrality on the part of both groups of belligerents, most of them in the milder form of flights across Danish territory; the most serious was a German aerial attack upon a civil aeroplane headed for the Netherlands, on Sept. 26, 1939; one passenger was killed.

The difficulties of shipping were more serious. During the winter of 1939-40, 33 Danish vessels were sunk by mines and U-boat attacks; 362 Danish seafaring men were lost

Denmark attempted, although without great success, to improve its commercial relations with England and Germany during the early part of World War II. The lack of goods gradually became manifest, and unemployment increased. When the government chose to untie the krone from its sterling rate and fix its value at 5.18 by the dollar rate, the reorganization of Danish agricultural economics and the institution of state subvention became necessary. On the home market, in Sept.—Oct. 1939, strong restrictions were enforced. Automobile and railroad travel was restricted. Gas, electricity, sugar, coffee and tea were rationed, and maximum prices were fixed for grains. Simultaneously, large increases of direct and indirect taxes were ordered.

The winter war in Finland stirred the people greatly, and their sympathy was manifest in their support to that country through collection of money, clothing and food.

One Danish ambulance went to the front. Not only Danish soldiers but workmen registered for service by the thousands; and thousands of Danish homes opened their doors to the care of Finnish children.

The Nazi Attack.—After a few days of rumours and tension, Germany violated Denmark's neutrality on April 9, 1940.

The Danish government had been warned by the Berlin embassy on April 4, reporting preparations for shipping of German troops. But the Danish government trusted the promises of Germany; the military authorities had demanded mobilization of the army, but the government refused.

The occupation took the form of a surprise attack. Even before the German ambassador, Cecil von Renthe-Fink, had delivered his ultimatum at 4:20 A.M., masses of German troops crossed the borders or were landed in Danish seaports. The ambassador's statement said that Germany had occupied Denmark in order to prevent the western powers from "turning the country into a battle area," and that "Germany does not intend now or in the future to interfere with the territorial integrity or with the political independence of Denmark."

In the early morning hours the king and the leading members of the government assembled at Amalienborg castle. While German bombing planes coursed above and the royal guard clashed with German troops, it was decided to give up armed resistance. Before this order was received by the defenders at the borders, the guard had resisted the overwhelming invasion for several hours.

Before nightfall the country was in a state of occupation; railroads, radio and the public press were under the control of the Germans. The government's proclamation to the people stated: "It is the duty of the people to abstain from any resistance. The government will attempt to prevent the terrors of war from reaching the Danish people and their land, and therefore ask the people to maintain a quiet and reserved attitude toward the conditions now existing. Order must rule the country, and a loyal disposition must be shown toward everybody exercising authority."

To this the king added: "I exhort one and all, in our towns and outside, to conduct themselves correctly and properly, because any thoughtless act or utterance may have the most serious consequences. God preserve all of you; God preserve Denmark."

A general blackout was organized at once; the exchange was closed and the sale of alcoholic liquors was stopped. Everything was done quietly; the people were prostrated by the events which everybody considered likely to be temporary.

The legislature, meeting in the evening, silently accepted the decisions of the government. Later, a strong critical attitude developed. All parties understood that every internal political difference now should be disregarded. This found expression in the election to government posts of representatives of opposition parties, Lefts and Conservatives, on the very next day. The government until then had consisted only of Radicals and Social Democrats. Beyond these party lines were only the Communists and a strongly radical farmer group, and a small party of nazis. Of greater significance were some large industrial groups which had no confidence in the politicians; for several months they made unsuccessful attempts to produce an interest in a government composed of professional people.

The German army, under Gen. Leonard Kaupitsch, fortified its position in Denmark. Large airports were built everywhere, and gigantic fortifications were con-

structed along the coastlines of the nation.

Danish vessels at sea took refuge mainly in Allied or U.S. ports. Henrik de Kauffmann, Danish minister in Washington, refused to recognize the German-controlled government but remained at his post as the representative of a free Denmark. The Faeroe Islands were placed under the protection of British troops on April 11.

Political unity was emphasized again on July 8, 1940, by a change in the personnel of the government, in which the four above-mentioned parties became equally responsible. Persons outside the political area also were given seats in the government, e.g., Eric Scavenius, who, as minister of foreign affairs, struck a note of tolerant understanding of the German policies which very soon resulted in a serious difference between him, the political ministers and the majority of the people. But national self-respect grew, and the young people united into a Danish Youth's Working alliance. The occupation forces met coolness and contempt.

The German military occupation soon took on a strongly political character, aiming at the Germanization of the Danish people. But this only strengthened the resistance. Attempts at the establishment of a Danish-German financial and customs union in Aug. 1940, and at obtaining a change of government about the new year, 1941, were defeated by Danish solidarity. But minor demands were met; various political officials withdrew, the penal code was made more rigorous and normal local elections were deferred. In Jan. 1941 the Germans took possession of six Danish torpedo boats.

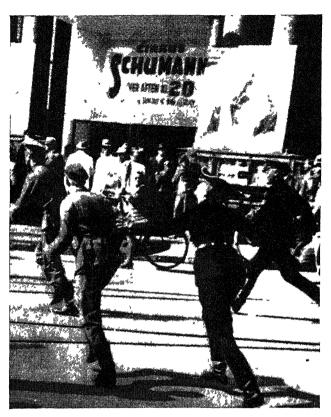

The free Danish diplomats throughout the world found their position difficult. Gradually, as they resisted the political acts of the government, they were dismissed, but almost all continued to function as representatives of a free Denmark. The first dismissal struck Henrik de Kauffmann, the Danish minister at Washington, D.C., but on April 9, 1941, he made an agreement with the U.S.A. whereby the latter assumed protection of Greenland.

When, on June 22, 1941, the Germans attacked Russia, they made fresh demands on the Danish government. The Communist party was proscribed; 300 Communists were interned without legal procedure, and the Danish minister in Moscow was recalled. Permission was given to Danish nazis to recruit volunteers for service with the German army on the Russian front. These violations of the Danish constitution caused great resentment. From this time an illegal, active resistance grew up. Through thousands of secret meetings and in various illegal newspapers, information was passed out among the people explaining the German encroachments.

The first great crisis, in Nov. 1941, was caused by Germany's demand on Denmark to join the Anti-Comintern pact. The government yielded to the German threats, but large demonstrations organized by university students showed the true attitude of the people.

After the death of Prime Minister Stauning on May 3, 1942, Vilhelm Buhl took over his post. A Social Democrat, he displayed great energy in counteracting German influences. Almost simultaneously the minister of commerce, Christmas Möller, escaped to England. His radio addresses there were influential in promoting active resistance in Denmark.

The Germans, searching for some cause for an open break, found what they desired in King Christian's telegraphic reply to Hitler's congratulation on the king's birthday, Sept. 26, 1942. The king merely replied, "My best thanks." This was considered in official German circles as a breach of decorum. After a month of nervous tension,

Danish patriots being routed by nazi soldiers during antifascist uprisings in Aug. 1943

during which a new chief of German forces in Denmark was appointed, Germany demanded a change in the Danish government. The government once more yielded, but without palpable result, and the confidence in a continued peaceful development continued thoroughly shaken. Other German demands referred to the surrender of part of the depots of the Danish army and to the removal of Danish troops from Jutland. These demands were met.

Amid these momentous events, King Christian was seriously injured in a fall from his horse during his daily recreation; he recovered slowly. The new German representative in Denmark, Dr. Werner Best, attempted, meanwhile, to accomplish a satisfactory protectorate, with a view to attracting Danish industrial production toward the German war economy. This gave rise to an even more active resistance than before, and from this time a widespread sabotage spread like wildfire.

Naziism Flouted.—Elections for the folketing (lower house) were held on March 23, 1943. Best gave his permission, probably hoping that this would be considered a gesture of conciliation. All the parties viewed the election as an opportunity to declare themselves in favour of a true democracy. The occasion turned out to be a great national demonstration. Of a total of 2,280,716 voters, 2,040,583—a record 89.5%—cast their votes. The nazi group met a crushing defeat, with the democratic parties collecting 94% of all votes. The following months were full of unrest. German encroachments gave rise to strikes. About the middle of August a general strike extended over 30 towns.

On Aug. 28, 1943, the German government presented an ultimatum demanding the declaration of an emergency, the introduction of the death penalty and the right to arrest Danish hostages. They insisted on a reply by 4 P.M. the same day. The reply was negative. The Germans then

ceased to negotiate and struck hard. On Aug. 29, during the early morning hours, they attacked the small Danish garrisons, forced their surrender and placed the men in internment camps. The navy, however, succeeded in sinking most of the ships before arrival of the Germans. Some smaller craft escaped to Sweden.

An emergency was declared, and German military detachments occupied all Danish towns. The government at once withdrew, but the civil administration, on the recommendation of public officials, was continued.

The Germans attempted to create a new Danish governmental system, but the break was complete. On the night of Oct. 1-2 the gestapo, which by that time had invaded Denmark in large numbers, undertook thorough raids on the Jews; 492 individuals were detained by the Germans, while thousands afterward were illegally transferred to Sweden.

The interned Jews were taken to Theresienstadt in Bohemia, and many succumbed there, the survivors being taken to Sweden in the Spring of 1945.

About the same time a council of liberty, collective organization of all underground movements, was formed. During the remaining period of the occupation, this council became the directing power within the resistance, which grew rapidly from month to month. To this movement the officers of the army and navy attached themselves after their liberation.

Later the police forces joined in, and a strong military organization thus was built up, numbering about 43,000 at the time of liberation.

The most dangerous enemies of the Danish resistance were the so-called *stikkere*, or informers, who reported

Danish workers, massed before government buildings in Copenhagen during July 1945, demanded improved labour legislation

their countrymen to the Germans. By way of self-delense, many of these persons had to be put out of the way. The Germans retaliated by murdering well-known Danes. The first of these slayings was that of the pastor and poet Kaj Munk, who was dragged from his home on Jan. 4, 1944, and murdered by one of the unofficial gangs of the gestapo.

The resistance sabotaged railroads and factories engaged in service for the Germans. In retaliation, German hordes razed entire sections of some cities. One of these German measures of countersabotage, the destruction of the Tivoli in Copenhagen, gave rise to extensive demonstrations in the summer of 1944, the beginning of still larger episodes of similar kind which gradually resulted in a general strike. The Germans tried to counteract this by military force and by shutting off Copenhagen's supply of water, gas, electricity and food; but after some days they were forced to yield to the firm concord of an unarmed metropolis.

In order to deprive the civil population of its last remnant of legal security, the Germans seized and interned the Danish police force on Sept. 19, 1944. Many escaped, but about 2,000 were carried to German concentration camps. Only the guard at the royal castle refused to be disarmed and fought with such skill and zest that the Germans at last gave up the attempt to dislodge them.

The resistance movement received considerable aid from the royal air force. Three attacks, at Aarhus, Odense and Copenhagen, were effective in destroying German head-quarters in these cities. In the last of these attacks, on March 21, 1945, one bomber missed its course and fell on a school, killing about 100 children.

After the general strike in Copenhagen, Danish political leaders and the Council of Liberty conducted negotiations looking toward the establishment of a prospective government, to assume control when Denmark should become free.

Then followed the hectic days of May 1945 and rumours of German capitulation. The battlefront drew closer and closer to the Danish borders, across which a dense stream of Danish and Norwegian prisoners from German concentration camps, released through the negotiations of Count Folke Bernadotte, flowed. These thousands of sufferers carried ample evidence of the collapse and chaos in Germany. But the German forces in Denmark showed fight until the last moment. The commander, Col. Gen. Georg Lindemann, declared in a proclamation dated May 2: "I have undertaken no negotiations, least of all such as involve a capitulation; nor have I made preparations to evacuate. Both I and our troops know our orders but too well. We are ready to fight and to die for them."

On May 4, at 8:34 P.M., however, the long expected message arrived by way of the Danish broadcast from the BBC: "We have just learned that General Montgomery states that the German forces in Holland, Northern Germany and Denmark have surrendered, effective early tomorrow. Denmark is free."

Even before the radio message was finished, the news spread all over Denmark. The joy was indescribable. During the night the resistance took possession of all important centres in order that the capitulation might take place in an orderly and peaceful way. In a few places the nazis showed fight, and minor groups of fanatics held out for some days after. On May 5, at 8 A.M., the capitulation went into effect and was recognized by the ringing of church bells in all churches. The royal banner once more was raised at Amalienborg castle.

Return of the Government.—A unified government assembled under the leadership of Vilhelm Buhl and was joined by Christmas Möller, who returned from England, as minister of foreign affairs. The legislature convened on May 9 amid great solemnity, with King Christian presiding.

About 5,000 Danish fugitives, trained in military life and fully equipped, returned from Sweden to join the 43,000 men identified with the resistance; these forces, to-

gether with troops of the Allied armies under command of Maj. Gen. Robert H. Dewing, took charge of the enforcement of order.

The German garrison on the island of Bornholm in the Baltic, which lay within the war domain of Russia, refused to surrender but was forced to do so after a bombing attack by the Russian forces. The towns of Rönne and Nexö were reduced to ruins and were occupied by the Russians.

So the tragic years of occupation were ended. Denmark applied for and obtained a place among the Allied nations and began the huge task of reconstruction. World War II had caused comparatively little physical destruction, and the loss of life in Denmark had been small in comparison with that of other countries. The system of production, especially that of agriculture, had remained intact; but the lack of raw materials of all kinds loomed: fuel, raw materials for industry, foodstuffs and fertilizers. The economic dislocations stemmed mainly from the German debt, amounting to 8,000,000,000 kroner, and from a considerable accumulation of money and credit within the country. There also was an almost complete lack of foreign exchange.

The government proceeded to establish a system of taxation aimed at an absorption of profits from World War II. All current money was abrogated as valid means of exchange, and new treasury notes were issued. Simultaneously, for the first time, everybody was ordered to render complete accounts of their holdings. In this way previously hidden fortunes were discovered and confiscated, and the amounts thus collected were used to reduce the public debt.

At the general elections of Oct. 30, 1945, the Liberal party made such great advances that a new cabinet, headed by Knud Kristensen, resulted, a minority government supported by the various non-Marxist parties.

The defeat of Germany gave rise to a renewal of the problem of Denmark's relations to the southern part of Schleswig (Sydslesvig), previously Danish territory. At the outset no desire was expressed on the subject of changing the existing borders but merely on improving the conditions of the Danish minority settled in that province. But the new events caused large circles in Denmark, as well as Premier Knud Kristensen, to enter into a debate with England, Sydslesvig being within the British zone. The debate brought forward the desirability of establishing a mandate claim, the nationality of the province to be decided later by plebiscite. (K. Ged.)

Dental Association, American

See Dentistry; Societies and Associations.

Dentistry

Just as the study of medical education by the Carnegie foundation in 1910 had brought about a new era in medicine, so a similar study of dental education in 1926 had broadened the horizons of dentistry and resulted in increasingly rapid gains toward its goal of becoming a true learned scientific profession. More progress was made in this direction during the decade 1937-46 than was made in all the preceding centuries. These gains were in three major areas: in education, research and clinical practice.

Dental Education.—In 1937, all the dental schools of the United States put in force the requirement of two years of work in an accredited college of arts or science for admission, with physics, biology and chemistry as re-

quired science subjects. This was an important advance; it brought the requirement for admission to the study of dentistry up to the minimum requirement for admission to the study of medicine, and thus helped the dentist meet the physician on an equal footing. Its purpose was to give the prospective dentist a broader educational background on which to build his professional work. No longer could it be said that dentists were uneducated craftsmen.

Also in 1937 the American Dental association, with its 50,000 members, established a standing Committee on Dental Education, its members being chosen from the American Association of Dental Schools, the National Association of Dental Examiners and the American Dental association. In 1940, the council obtained the services of a full-time secretary who had wide experience in the field of education. The council set up certain standards for an acceptable dental school, and in 1944 began the work of accrediting dental schools. Its report in 1945 revealed the fact that while most of the schools of the U.S. could be given approval, several schools were not up to standard and approval was withheld. The fact that the council announced that it was to visit schools for accreditation purposes resulted in all schools "cleaning house" and eliminating, so far as possible, the weak spots. This work resulted in a marked improvement in the quality of teaching. The dental schools, however, were under a severe handicap-lack of adequate endowment. Income from tuition and from clinics conducted by the schools was not sufficient to develop a teaching and research program that could serve its greatest usefulness to students and the public. Until a school had a liberal endowment it could not develop as it should.

In 1945, the Curriculum Survey committee of the American Association of Dental Schools published a report, Teaching in Colleges and Universities (with Special Emphasis on Dentistry), which was a scholarly contribution to the literature of teaching and clearly indicated how far dentistry had gone along the path of progress.

The literature of a profession reveals its strength and its weakness as well. Dentistry had striven for several years to improve its publications. A Commission on Journalism of the American College of Dentists and the American Association of Dental Editors worked diligently during the decade 1937–46 toward this goal. In 1937, the Journal of Dental Education was started by the American Association of Dental Schools. It was concerned primarily with the problems of dental teaching and proved to be of distinct value to teachers in all the dental schools.

For a long time the subject of dentistry as a specialty of medicine had been discussed. The new knowledge of the relation of diseases of the mouth to diseases in other parts of the body all pointed to the necessity of a closer integration of medicine and dentistry and their respective educational institutions. In 1941, a book of considerable significance to dental education was published: Dental Education in the United States. The authors were the deans of two university dental schools. The book called attention to the pressure of new knowledge in all the sciences that was being brought to bear on dental education and dental practice and pointed out that this accumulated knowledge brought into existence at many points the need for further modification of the program of dental education.

In 1940, one large university decided to experiment with a new plan of dental education. A combined course of five years was offered under the jurisdiction of the faculty of medicine, the successful completion of which would bring an award of both the degree of Doctor of Medicine and the degree of Doctor of Dental Medicine. The experiment was not successful, partly because of war conditions, so a new program was developed in which a young man seeking a dental training would be admitted to the school of dental medicine on the same requirements as admission to the medical school. The first two years of the course were the same as for medicine and carried two years of credit in medicine. The last two years, as formerly, were given over to clinical dentistry. In 1946, the dental school of another university was taken over by the faculty of medicine, and the course was developed along lines similar to the one just described. These experiments were severely criticized, especially by those who believed strongly that dentistry should be an autonomous profession. Whether the experiments of these two universities would eventually set a pattern could not be fore-

During the decade, the importance of dental public health and the need of strong dental divisions in state and city departments of health were widely recognized. Such divisions were organized in some states, but when men competently trained to administer the work were sought it was found that they were almost entirely lacking. The establishment of courses in training for dental public health service by two leading universities came in response to a large demand. In one of these universities the course was offered under the joint auspices of the school of public health and the dental school, a collaboration which signified the progress made by dentistry.

In 1942, the American Dental association, in recognition of the importance of public health dentistry as a means of better serving the people, established a Council on Dental Health. Through the efforts of this national council, state councils on dental health were organized in most of the states. Dental health programs for children and adults were developed, and much dental health educational material was prepared.

Research.—During the early years of the decade 1937-46, the research attack on dental diseases was largely concentrated on nutritional factors. The vitamins and calciumphosphorous metabolism were studied by many investigators. May Mellanby of England concluded that the quality of tooth structure is of the greatest importance, being dependent upon nutritional factors during the formation of the teeth; with advancing knowledge of nutrition, it should be possible to reduce tooth decay. T. Streter von Krudenstein of Germany found in parathyroidectomized rats that calcification was largely a matter of raising the calcium content of the blood. Otto Bessey and S. Burt Wolbach at Harvard produced diffuse alveolar atrophy in animals fed diets deficient in vitamin C (ascorbic acid), and these findings corresponded in essential characteristics with type two pyorrhoea found in human beings. D. Perla and M. Sandberg of New York city concluded that the adrenalin gland is not essential in the production or utilization of vitamin C but described interesting changes in the incisor teeth of adrenalectomized rats. Nor were the hormones overlooked. Ira T. Nathanson and David B. Weisberger reported in 1939 on "The Treatment of Leukoplakia Buccalis and Related Lesions with Oestrogenic Hormones." The oestrogens were administered to patients in two forms-oestrodiol benzoate which was used parenterally and alph-oestrodiol which was given by mouth. Their conclusions were of interest:

Evidence was presented which suggested that leukoplakia buccalis and similar lesions are associated with alterations in the menstrual cycle in women and with a deficient or disturbed metabolism of the sex hormones in both sexes. Treatment with oestrogen based on this evidence resulted in the complete disappearance of the lesions in 42%, marked improvements in 39%, and no improvement in the remaining 19% or 38 patients. In general the women responded more satisfactorily to the treatment than did the men. Although further observation was needed it was suggested that this type of therapy in combination with other well-recognized procedures might prove of value in the treatment of leukoplakia buccalis. (New England Journal of Medicine, Oct. 12, 1939.)

Clinical experience following this report indicated the soundness of this procedure. In view of the fact that leukoplakia buccalis was regarded as a precancerous condition, the implications of the report were far reaching.

Dental caries had long been a hardy perennial among the various dental diseases. During the latter part of the decade 1937-46, research in this field increased in many areas. Research was largely concentrated on the effects of fluorine for the control and suppression of dental caries, and interest spread through the country at a rapid rate. Many reports of research appeared on the use of fluorine for the control of dental caries. The low incidence of dental caries among persons living in areas supplied by waters containing the fluorides was reported from many sections of the world. H. Trendley, dean of the U.S. public health service, reported that in areas where there is 0.5 parts per 1,000,000 of fluorine in the drinking water, there is a low incidence of caries. In areas where the fluorine is present above 2 or 2.5 parts per 1,000,000, changes in the tooth structure known as mottled enamel and hypoplasia of the tooth structure appear. This mottling and hypoplasia were produced experimentally in the teeth of rats by feeding potassium fluoride. This led to the idea that if approximately one part per 1,000,000 of fluorine was added to a community's public water supply there was excellent probability that dental caries might be controlled on a mass basis. So strong was the evidence that two experimental programs were set up. In New York state, the city of Newburgh authorized the placing of one part of fluorine per 1,000,000 to the domestic water supply. Provision was made to have the results carefully checked. Kingston, N.Y., close by, was selected as a control city for the Newburgh experiments. In Michigan, Grand Rapids authorized a similar experiment, and Muskegon was selected as the control city. The results of this experiment in Michigan were carefully checked by scientists from the University of Michigan. A second method of utilizing fluorine was studied. This method consisted of topical application of a 1% sodium fluoride directly to the teeth. One investigator reported that in experiments in 80 children over a period of two years, this topical application of 1 to 1,000 solution of sodium fluoride reduced dental caries by somewhat more than one-third as compared with results in the corresponding untreated quadrants in the same mouth. Nothing previously studied had offered such important possibilities for the control of one of the most prevalent diseases in man.

During the decade there was also an increased interest in what became known as industrial dentistry. Certain occupations seem to predispose those engaged in them to certain dental difficulties. The loss of time of the worker from ordinary dental disease also became an important economic factor in industry. Isaac Schour and B. G. Sarnat described some of the early manifestations of occupational origin. These manifestations—reactions to noxious agents, chemical, physical or bacterial—were observed to take one or more of the following forms, abrasion, the decalcification of the teeth, inflammation and circulatory disturbances of the mucous membranes. Of particular interest during

the period of World War II was the observation that munition workers exposed to acids often showed decalcification of the teeth. Metal workers, on the other hand, developed enamel pigmentation. Gingival haemorrhage and ulceration and necrosis of the mandible were reported among those exposed to benzine such as coke-oven and smokeless-powder workers. This naturally stimulated employers of labour to develop dental programs and dental care in their plants. Earle H. Thomas, in a paper on "Mouth Infection in Industrial Workers," pointed out the importance of maintaining oral health as a means of preventing loss of numerous man-hours, and of increasing production. Harold A. Hooper, dental consultant for the Chicago, Milwaukee, St. Paul and Pacific railroad, stated in a paper on "Dental Services in Industry" published in Clinics, vol. 2, p. 703-718 (1943), that "No student of the problem of employee absenteeism resulting from nonoccupational illnesses can come to any other conclusion than that oral sepsis is a major, if not the major, underlying 'root' cause of an astonishing proportion of it."

A recognition of the importance of these conditions resulted in a study by the Council on Dental Health of the American Dental association on the problems of industrial dentistry. A sufficiently large number of industries developed dental services with the employment of dentists in their plants, so that an organization of industrial dentists was formed in 1943.

Vitamins.—The effect of various vitamins on normal and diseased tissues of the mouth was studied. It had long been known that vitamin C has an important role in the maintenance of healthy gums; in fact, vitamin C had been called the gum vitamin. One study showed that of a group of people with disease of the gums 94% had a low vitamin C blood level, and that the administration of synthetic vitamin C, with no other treatment, improved materially the health of the gums. But it was also shown that vitamin A, various fractions of vitamin B and vitamin D also played their part in the maintenance of a healthy mouth.

Clinical Practice.—One of the outstanding developments in industry generally in 1940 was the rapid development of plastics for various uses. Dentistry soon found that the plastics offered a very important advance in the restorative procedures. For many years vulcanized rubber had been used as the best material for dentures; this material, however, had some serious disadvantages. Plastics seemed to fulfil all the requirements that vulcanite had offered, with an elimination of most of the disadvantages of the latter. As a result plastics began to be used very widely, and it proved to be so satisfactory that teaching of the construction of dentures with vulcanite rubber was given up in some of the dental schools. The modern plastic had completely replaced an old favourite. Two papers in 1940, "A Century of Progress in Dental Base Materials" and "Non-metallic Denture Materials-their Development and Relative Merits," dealt intensively with this subject. In the last five years of the decade, acrylic resins were used in constantly increasing quantities.

Dental infections, both acute and chronic, had long been a serious problem in the practice of dentistry. For the most part they were treated surgically, frequently with the loss of teeth and other tissues. Fortunately the organisms ordinarily found in the infections of the mouth are susceptible to the new wonder remedy—penicillin. Vincent's infection, or trench mouth, was extremely prevalent both in military and civilian life. In an evaluation of penicillin therapy at the National Naval Medical Center,

Bethesda, Md., based on 1,455 cases, it was found that in stomatitis and Vincent's infection treated with 20,000 units of penicillin intramuscularly every two hours for two or three days, good results were obtained. Many other reports from various other centres gave similar encouraging results. Later, development of penicillin therapy resulted in the use of agar pastilles of penicillin dissolved in the mouth. The opinion of one group was that these pastilles provided the best-known type of therapy for Vincent's infection.

No account of dental activities during the years 1937-46 would be complete without mention of the 100th anniversary of the founding of the first dental school in the world. This centenary was observed in Baltimore in 1940. Delegates from various dental organizations in the United States and in many other countries of the world attended this significant celebration. Scientific sessions were held over a period of three days. Papers and reports presented at these meetings, in published form, resulted in a book of somewhat more than 1,000 pages. The meeting outlined the efforts dentistry had made to improve itself and obtain an honoured place in the role of the great professions such as law, medicine and the ministry; it gave a great impetus to dental educators and dental practitioners and undoubtedly marked a new era for the profession of dentistry and for the public.

Dentz, Henri Fernand

Dentz (1881-1945), French army officer, was born Dec. 12, 1881, in Roanne, France. He entered St. Cyr military academy at the age of 19, and later joined a zouave regiment as lieutenant. Graduated from the École de Guerre in 1910, he served in World War I and was cited three times, being promoted to rank of major. After the war he served in occupation posts in Mainz, Germany, and at Constantinople (Istanbul). Sent to Syria, he headed the French military intelligence. Promoted to brigadier general in 1934, he was made commander of an army corps in 1939.

Dentz joined Vichy after the collapse of France in June 1940. In Dec. 1940 he was appointed high commissioner of Syria and Lebanon and was put under direct orders of Gen. Maxime Weygand. On June 8, 1941, British and Free French armies invaded Syria after Vichy rejected

Allied demands to oust axis agents there. The Vichy forces resisted the British drive, but Dentz's position was hopeless and he concluded an armistice on July 12, 1941. Interned Aug. 8, 1941, by the British on a charge of violating the armistice agreement, he was subsequently released in Sept. 1941 in an exchange of prisoners.

In 1945 Dentz was tried before the high court of justice in France on charges of treason. Found guilty, he was sentenced to death (April 20), but the sentence was commuted in October to life imprisonment by Gen. Charles de Gaulle. Dentz died Dec. 13, 1945, in Paris.

Dermatology

The decade 1937–46 registered great advances in dermatology as in many other branches of medicine. The introduction of numerous new drugs probably accounted for the most striking and at times dramatic advances which were stimulated by World War II. The war was also responsible for the new interest shown in tropical diseases of the skin and in industrial dermatoses.

Tropical Diseases of the Skin.—Pinta.—Of all the tropical skin diseases, pinta yielded most to advances in medical knowledge during the decade. Confined almost entirely to the American tropics, pinta had become especially widespread in Mexico and Colombia.

The cause of pinta was discovered on Aug. 3, 1938, by J. Grau Triana and J. Armentéros in Havana, Cuba, the causative organism being a spirochete, morphologically identical with those causing syphilis and yaws. This discovery upset the erroneous views held by the majority of physicians for 40 years and proved that the disease was not caused by fungi.

Soon after the discovery of the Treponema herrejoni (the name used in Mexico), F. León y Blanco, a Cuban, went to Mexico, where he made some striking discoveries. He proved by inoculating numerous volunteers, including himself, that an initial lesion would appear at the end of a week and that within three to nine months secondary manifestations, so-called pintides, would often appear. These lesions were nonspecific in appearance, often resembling psoriasis, syphilis, ringworm and even leprosy. However, until the treponema was discovered, their relation to the disease was incapable of proof.

The serologic reactions with complement fixation or flocculation tests were negative during the primary stage and positive in the majority of cases in the secondary stage. It may be said that the late dyschromic stage constituted all that was known of pinta prior to the discovery of the causative organism.

León y Blanco not only proved that the disease was inoculable in man but that immunity was not conferred by a previous infection with syphilis.

Leprosy.—Leprosy was of increased interest because a large number of men in the armed forces spent months or years in countries where the disease was endemic. That there would be new cases of leprosy in temperate climates among returning veterans of World War II was unquestionable, although the actual number could not be told for 10 or 15 years, owing to the variable period of incubation.

At the International congress in Cairo in 1938, the term "neural leprosy" was redefined. This includes all cases of "benign" type with polyneuritic disturbances or macules of nonlepromatous nature. Many lesions are histologically of tuberculoid nature, including changes in nerves, as shown by V. Pardo-Castello. Harry L. Arnold stressed the importance of differentiating lepromatous from neural leprosy. This enabled the physician to decide on the disposition of the case, to evaluate the effect, if any, of treatment and to soften the blow when informing the patient of his disease. Arnold believed the term "mixed leprosy" should be abandoned as it was never intended to mean mixed types of the disease but mixed sites of involvement, both skin and nerves.

These authors agreed with South American dermatologists that the term "tuberculoid" should be substituted for neural leprosy.

Almost every conceivable form of treatment had been used in leprosy with poor results in general. Even chaulmoogra oil and its derivatives were thought by some experienced leprologists in 1946 to be without value, according to George W. McCoy. Experimental work at Carville, La., with three synthetic sulfonamide drugs, including promin, promizole and diasone, gave more hopeful prospects.

Oriental Sore.—Oriental sore (cutaneous leishmaniasis) was intensively studied by D. A. Berberian. He found that immunity was not complete until the sore had healed. He stated that the disease may also appear at times after exceptionally long periods of incubation. In three artificially induced lesions, the time was 18, 30 and 56 months respectively. Immunity was achieved only by natural infection or by an artificially induced sore, but not by vaccines alone.

I. Katzenellenbogen reported on 416 persons whom he vaccinated against oriental sore. In 237 cases a sore developed after an incubation period varying from less than two weeks to 18 months. This reduced the incidence of the disease in an endemic area. He advised that vaccination should be made four to five months after the beginning of the sand fly season.

A. Dostrovsky and Felix Sagher obtained excellent results in Palestine in treating 72 cases by grenz rays. Twelve of these were cases of the unusual recurrent types which had previously been entirely rebellious to treatment.

The occurrence of oriental sore in the western hemisphere continued only by importation. Kermit G. Dwork collected, from the literature, reports of 28 cases observed in the United States and Canada and added 4 others.

Cutaneous Diphtheria.—According to Morris H. Saffron, cutaneous diphtheria is a common disease in certain areas where diphtheria is more or less endemic and climatic conditions are favourable. During World War II it was a military problem, especially in the near and middle east, southern Europe, India and the African coast. Two forms of the disease occur, the acute variety, which is rare and is associated with nasal or faucial diphtheria, consisting of a solitary lesion, and the chronic variety characterized by multiple indolent lesions resulting from superinfection of a pre-existing dermatosis by Corynebacterium diphtheriae. Both types may result in characteristic post-diphtheritic complications such as paralysis and myocarditis. The treatment recommended was diphtheria antitoxin administered parenterally in fairly large doses.

Parasitic Diseases.—A real triumph was scored in the control of pediculosis during World War II, to the extent that the U.S. soldier rarely became personally acquainted with the body louse. However, masses of the civilian population in liberated and occupied countries did not escape

louse infestation. It was especially severe in Naples, Italy, in the winter of 1943. One thing alone obliterated this menace and that of typhus fever, namely, the use of the new insecticide commonly called DDT. Delousing was accomplished principally by using the drug as a powder of 10% in talc, dusted by blowers onto the body and through the clothes.

Scabies was not eliminated during World War II, and it reached epidemic proportions in the European civilian population. It was the most common skin disease seen in the army, at least in the European theatre. Treatment of scabies by sulphur ointment had always been the standard procedure until 1937. Benzyl benzoate was used in the British and U.S. armies because it was felt that considerable loss of manpower was saved by the one day ambulatory treatment as opposed to the three or four day sulphur ointment treatment, which often required hospitalization.

Fungus Diseases.—Dermatophytosis.—World War II added fresh importance to dermatophytosis and stimulated many investigations of this disease. Those of Fred D. Weidman, Joseph G. Hopkins, Chester W. Emmons and George M. Lewis indicated certain changing concepts. Bacteria were gaining prominence as a cause of many cases of infectious intertrigo that had previously been considered mycotic in origin. They emphasized sensitization to local applications, trauma and long-standing hypostasis as a cause of dermatitis. The use of foot baths containing chlorine compounds was becoming discredited. More emphasis was laid on careful hygiene of the feet in prophylactic treatment. Evidence was submitted in the controversy whether dermatophytosis predisposes to contact dermatitis. The evidence indicated that it does not. This was of importance in adjudging disability claims, both civil and military. They proposed methods of standardizing fungicides and the clinical evaluation of them. For therapy, some of the older remedies, like Whitfield's ointment and boric acid, were found to be of value, as were some of the newer fungicides, such as the fatty acids and their salts.

While in the navy, Marion B. Sulzberger and A. Kanoff experimented with various remedies for fungous infections of the feet. Previous findings were confirmed that undecylenic powder was the most practical and effective remedy as prophylaxis. It showed its superiority in maintaining freedom from even minimal or "subclinical" signs of infection. No essential difference in the value of undecylenic powder or ointment was observed.

Wood Filter.-Although the Wood filter had been invented in 1903 by the physicist Robert W. Wood, it became an extensively used dermatologic practice only during the decade 1937-46. As stated by Maurice J. Costello, fluorescence with the Wood filter is an important aid in the diagnosis of ringworm of the scalp, beard and body. Hairs of the scalp infected by Microsporon audouini fluoresce with bright luminous pale green colour. The Wood filter also checks the progress of the disease or treatment and is one of the most practical means of determining a cure. It is of great value in detecting cases of tinea capitis, which show little clinical evidence in spite of wide extent of infection. It is especially valuable as a quick method of examining large numbers of school children during an epidemic. It can also be used to detect the presence of fungus on pet animals, infected headwear, clothing, etc.

Occupational Dermatoses.—With the enormous increase

of industrial activities during the war years, the importance of the industrial dermatoses as a factor in the efficiency of war production focused the attention of many dermatologists on this problem. Their work greatly increased knowledge of the methods of causation and prevention as well as the mechanisms involved in the production of dermatoses.

The most important work in the field could be divided into three main headings: (1) causes; (2) diagnosis; and (3) prevention of industrial dermatoses.

An important advance in causation was the realization that most of the industrial irritants could be divided into two main groups-primary irritants and sensitizers. It was quickly realized by actual field work that primary irritants were responsible for more than 80% of the dermatoses. Many authors, especially Louis Schwartz, wrote extensively on the main primary irritants in industry, the most important of which were the cutting oils and the solvents. Outstanding was the study of the mechanism of causation of occupational acne by Schwartz and Samuel M. Peck. Another conception which applied as well to the broad field of allergic dermatoses in general was the observation that "hardening" occurs in industrial allergic dermatoses. This mechanism or the development of a hypo-allergic state from continuous contact with a sensitizer could be applied to all allergic contact dermatoses. The epidemiology of dermatophytosis and its method of spreading were also well studied among the industrial population by Peck and his co-workers.

Improvement in diagnosis of industrial dermatoses was acquired by recognizing well known entities usually caused by primary irritants which give more or less specific syndromes and by the use of the patch test. Lists of concentrations of patch test substances were constantly being added to, so that the practising physician could carry out such tests properly.

The necessity, because of war conditions, of keeping the worker at his job was a tremendous spur to the development of preventive measures when contact with industrial irritants could not be avoided by a totally enclosed process. These included protective ointments, protective clothing of various types and industrial skin cleansers.

Vitamins.—One of the fields of medicine attracting a stupendous amount of research during the decade was the vitamin deficiencies. Specifically, as far as skin diseases were concerned, only a few dermatoses were found to be definitely related to avitaminosis. Paul A. O'Leary divided dermatoses in which vitamin therapy had been investigated into three groups: (1) those in which vitamin therapy had produced rapid and clear-cut response; (2) those diseases in which the results were less conclusive and not seen in every case; and (3) the group in which vitamin therapy reportedly caused improvement but on later investigation showed insignificant change.

Those diseases responding to vitamin therapy included pellagra, cheilosis, phrynoderma, pityriasis rubra pilaris, keratosis follicularis and the seborrheids described by Paul Gross.

A small group of skin diseases showed partial response or inconsistent response to vitamins; these were lichen spinulosus, Keratosis pilaris, senile vaginitis, Monilia infections, rosacea, keratotic psoriasis, acne cachecticorum and "dry skin." Dermatoses showing insignificant response to vitamin therapy were dermatomyositis, scleroderma, epidermolysis bullosa, lichen planus, acrodynia, herpes zoster and the prevention of arsphenamine dermatitis.

Therapy.—Sulfonamides.—Sulfonamide and its derivatives were proclaimed by some observers "the greatest therapeutic achievement of modern medicine." Besides the original sulfanilamide, numerous other compounds were developed during the decade 1937–46 and were used internally and externally in many dermatoses of various and often unknown causation. An enormous amount of clinical and experimental material was accumulated, and the therapeutic results reported by various authors in the same disease were often contradictory, ranging from brilliant success to failure.

Maurice J. Costello and co-workers obtained good results in chancroid, *inguinal adenitis*, nonspecific ulcers, lymphangitis associated with dermatophytosis, *dermatitis herpetiformis*, ecthyma, impetigo, furuncles and carbuncles.

According to Frank C. Combes and Orlando Canizares, sulfonamides deserved a trial in many dermatoses, especially if other methods of treatment had failed, such as erythema multiforme, erythema nodosum, postular bacterids, pyoderma gangraenosum and hydradenitis suppurativa.

Observations by H. W. Barber and others showed that different sulfonamides differ in their therapeutic effect. Some diseases which do not respond to one compound of this group respond well to another. Sulfapyridine, e.g., proved most effective of the entire group in dermatitis herpetiformis, acrodermatitis continua and actinomycosis. In cases of chronic and resistant diseases, sulfonamides were given in some cases for a long period of time, for months and even for several years before a decided improvement or clinical cure was obtained. Donald M. Pillsbury and other authors advised not applying the drug locally for more than five days in succession to avoid sensitization, especially by sulfathiazole. Local applications were found almost as dangerous as internal use due to absorption of the drug, especially if it was used on large denuded or eczematoid areas. Observations indicated that a sensitization might develop without any visible signs and might persist for many years after the drug had been discontinued.

Numerous observations were published on eruptions in patients receiving sulfonamide compounds. These eruptions presented various clinical types, including macular, papular, vesicular, bullous, urticarial and purpuric, and were often accompanied by chills, fever and changes in the blood. A few fatal cases were reported. These eruptions were considered to be due to sensitization, the toxic action of the drug itself and sensitization to light.

Penicillin.—The furor created by the introduction of penicillin was followed by a thorough trial in dermatology, as in all other branches of medicine. Theodore M. Cohen and R. O. Pfaff considered that the pyodermas as a group presented the most promising field for this drug. They found it of special value in impetigo contagiosa, furunculosis, so-called tropical ulcer and dermatophytosis secondarily infected with haemolytic streptococci and secondarily infected eczema. So-called tropical ulcers constituted 24% of patients in the South Pacific with pyodermas. When penicillin in ointment form was used to replace sulfathiazole ointment, healing time was cut to 30% with no evidence of irritation.

An important feature of penicillin is that it is an essentially harmless drug, causing at times only mild reactions. Unfortunately, it did not prove of value in any serious disease of the skin comparable with the astonishing results in syphilis. Its value was proved in Vincent's angina and actinomycosis.

Harry J. Templeton and his associates had excellent

results using gauze impregnated with penicillin liquid in superficial infections of the skin. In deeper infections like sycosis vulgaris, their results were of questionable value. It was unfortunate that all cases of such an almost incurable and deforming disease as sycosis vulgaris did not always respond to penicillin. A. Burrows and others who treated this disease with penicillin cream stated that it was an absolute requirement, before beginning treatment, to test the sensitization of the causal organism to penicillin.

Reactions from penicillin were of urticarial type after injections and of eczematous type after application of an ointment. Leon Goldman noted 16 cases of contact dermatitis out of 350 cases in which penicillin ointment was used.

Tyrothricin.—Tyrothricin was first reported as a germicidal agent by R. J. Dubos in 1939. It was extracted from cultures of a soil bacillus and contains two antibiotic substances. Tyrothricin as a whole is effective primarily against gram positive bacteria and must come in direct contact with the microorganisms. The presence of pus or serum inhibits its activity. Tyrothricin has been used in the form of a solution and an ointment. The solution has been used as wet dressings or as an irrigation. Both the solution and ointment are stable and do not require refrigeration. Tyrothricin can be used only for local applications. It is ineffective when taken orally and is both ineffective and dangerous if used intravenously.

Local applications of tyrothricin did not produce toxic manifestations, pain or discomfort according to M. L. Rankin, who obtained excellent results in chronic ulcers of the leg. Harold E. Anderson noted good results in pyoderma, traumatic ulcer and decubitus ulcer. A. G. Franks and others found tyrothricin effective in *impetigo contagiosa*, pyoderma and *dermatitis repens*, but of limited value in *sycosis vulgaris* and nummular eczema. According to the best observers, tyrothricin is effective only against superficial inflammatory eruptions and secondarily invaded eruptions, especially if caused by the Staphylococcus or Streptococcus.

Antihistamine Drugs.-Great progress was made in the synthesis of substances with an antihistamine effect. The three most effective drugs of this type were antergen, benadryl and pyribenzamine. The most striking results were obtained in both acute and chronic urticaria. The disadvantages were that in some cases the effect continued only as long as the administration of the drug continued, and numerous disagreeable reactions were encountered at times. According to Earl D. Osborne and others, from an experimental and laboratory standpoint and their own experience, pyribenzamine was the drug of choice. Reactions were minimal and seldom necessitated stoppage of the drug. All cases of acute urticaria were relieved, and about two-thirds of the cases of chronic urticaria were benefited. The drug was also helpful, but to a much smaller degree, in atopic eczema.

Of 18 cases of urticaria treated by Arthur C. Curtis and B. B. Owens with benadryl, 14 showed decided improvement. Of eight cases treated by Loren W. Shaffer and associates, all except one showed favourable results. Of 20 cases of urticaria treated by G. Waldbott, complete symptomatic relief was obtained in 16 cases. However, the use of benadryl by S. J. Levin showed that, in 63% of the cases, there were reactions of some type, in half of which the drug had to be discontinued.

Podophyllin in Verruca Acuminata.—The successful use of podophyllin in the treatment of acuminate warts was not generally known until the reports of Isaac W. Kaplan and his co-workers were published in 1942. They found that the lesions disappeared rapidly and permanently after

one or two applications of a 25% suspension of podophyllin in mineral oil. No satisfactory reason for its curative action had been discovered at the end of the decade. Maurice Sullivan and L. S. King treated 50 cases according to the technique of Kaplan and obtained complete cures in 48 cases of the moist type. The two failures were of the dry type, which approximated Verruca vulgaris. In treating 100 cases of common warts by the same method, only 15% of cures were obtained. As these authors considered a disadvantage of Kaplan's technique to be a tendency to spreading of the remedy to the normal mucosa, they treated another series of 30 cases with 20% podophyllin in alcohol. This resulted in a complete cure of all of their cases with much less irritation to the normal mucosa.

Calciferol in Lupus Vulgaris.-Remarkable results in the treatment of Lupus vulgaris with large doses of calciferol were reported by G. B. Dowling and W. P. Thomas. They treated 38 cases, of which 16 were followed for more than a year. In all of them improvement was observed and in 12 cases the lesions seemed to have disappeared entirely. In one case, there was a return of the disease in the 18 months after the treatment was stopped. The treatment had the disadvantage of doses which border on the toxic. At least eight patients showed signs of intolerance such as nausea, loss of appetite and depression. Most of these received 150,000 units of calciferol daily. All of these toxic symptoms disappeared when the dosage was reduced to 100,000 units. Calciferol is prepared artificially by irradiation of ergosterol. Large doses are known to cause deposition of calcium in soft tissues, notably the renal tubules and arterioles and the media of large blood

Treatment of Lupus Erythematosus.—The disseminated type of Lupus erythematosus is such a serious disease that any new remedy recommended by an experienced dermatologist was worthy of trial. A. Benson Cannon reported successful results in five cases of this disease following oral administration of iodine. All five patients had previously received various methods of treatment without success. Cannon administered iodine in doses of three drops, three times a day, increased at times to 20 drops. The patients were also given vitamins and a high caloric diet, 3,000–5,000 calories a day. All gained weight, and all of the cutaneous lesions disappeared completely.

Mapharsen was tried experimentally by Lawrence C. Goldberg in 21 cases of the chronic discoid type of Lupus erythematosus. An average of ten injections was given in doses of 0.02 gm. in 4 cc. of distilled water. Improvement occurred almost immediately. The redness disappeared first, and later the scaling. Pigmentation never entirely disappeared, especially in Negro patients.

BAL (Anti-lewisite).—The search for a drug to combat arsenical poisoning was stimulated by World War II, when it was realized that arsenical war gases might be used. A neutralizing agent against the arsenical war gas lewisite was developed by R. A. Peters and his associates, which the British named BAL for British anti-lewisite. Applying this compound as an ointment prior to exposure to the arsenical vesicant agents, no cutaneous damage resulted. Also, even if the vesicant was applied first, BAL stopped further damage if applied within two hours.

The most promising use for BAL was found when it was determined that intramuscular injections of a 5% to 10% solution in oil gave excellent results in treating systemic arsenical poisoning caused by syphilitic therapy. Harry Eagle reported the largest series of cases of arsenical poison-

ing treated by BAL and found that most cases of arsenical dermatitis, toxic encephalitis, agranulocytosis and arsenical fever responded well to intramuscular injections of BAL. Other heavy metal poisonings, especially mercury, also responded to treatment with this remedy.

Surface-Active Agents.—With the development of synthetics, chemists produced substances of great interest to dermatologists—surface-active agents. Some of the earliest of these were the "sulfonated" oils used in the textile-dyeing and leather industries. They were produced by treating various vegetable and animal fats with sulphuric acid. The sodium salts which are reasonably stable were the progenitors of hundreds of synthetic surface-active agents. These substances were utilized in dermatology as soapless detergents and as emulsifiers of hydrophilic ointment bases and creams. The use of these agents as a substitute for soap in the cleansing of the acutely inflamed or chronically irritated skin became widespread both in the management of various eczematous eruptions of the hands and as a prophylaxis.

Many of these synthetics were tried in the development of the hydrophilic water-soluble ointments, in which any kind of water-soluble, oil-soluble or insoluble drugs could be incorporated. In ointments these emulsifiers permit the vehicle to absorb water, a valuable feature, since petrolatum, which does not absorb water, had largely replaced the animal and vegetable fats.

Another property of these surface-active agents is their ability to lower the surface tension of bacteria and, as a result, greatly increase the efficiency of bactericidal solutions. Also, some of the surface-active agents are potent germicides in their own right.

Electrocoagulation in Hypertrichiasis.—The removal of superfluous hairs by electrocoagulation has the advantage of rapidity over electrolysis. About 200 hairs can be removed in an hour by a skilled operator. Pain is slight and is well tolerated when 60–70 milliamperes are used intermittently for three or four seconds. The current employed is a highly damped oscillatory discharge with a frequency of 1,000,000 cycles per second. It is obtained from a small spark gap type of high frequency apparatus. In some cases, there is an erythematous reaction about the hair follicles, always disappearing in two or three weeks. In 103 cases treated by Charles Lerner, no scarring occurred and no recurrence at the end of six months.

Rhus Extracts.—F. A. Stevens summarized the knowledge of the status of poison ivy extracts in 1945, and stated that treatment of acute poison ivy dermatitis by extracts had been favourably reported by several dermatologists more than 20 years previously. However, Stevens concluded that because of reactions reported in the treatment, because the practice was not in conformity with theory, and because poison ivy dermatitis is a self-limited disease, the use of the extracts in treatment was to be condemned.

As to prophylactic use of the extract, most of the earlier work was done without controls, and later work showed that some degree of protection was really obtained by using extracts as a prophylaxis. Stevens said that desensitization can be accomplished prophylactically by the use of extracts, especially by potent oral preparations. However, no such potent oral preparations had been submitted to the Council on Pharmacy and Chemistry by 1946.

Dermatitis Caused by Nail Lacquer.—During the first half of the decade 1937-46, there were many reports of dermatitis in women from nail lacquer. Cases were constantly seen by dermatologists, and the eruption became

known to the general profession and some of the laity. Earl D. Osborne and associates reported a series of 100 cases in 1941. Nail lacquer by 1946 was the most common cause of dermatitis of the eyelids in women. The eyelids were affected in every case, though in addition, the eruption might occur on other parts of the face, neck, chest, etc. Fred Wise and Marion B. Sulzberger stated that they had even seen several cases of *Pruritus vulvae* due to nail lacquer. Patients, they said, seemed to be hypersensitive only to one or more dyes, or to perfumes, fixatives or plasticizers used in the lacquer. The patches are erythemato-squamous and disappear soon after the removal of the lacquer. For some unknown reason, patch tests are not of much value as they may be negative in undoubted cases.

Familial Benign Pemphigus.—In 1939, Howard Hailey and Hugh Hailey described a clinical syndrome called by them familial benign chronic pemphigus. This eruption is characterized as a chronic disease with distinctly familial tendencies. The primary lesion is a vesicle or bulla arising on normal skin, which ruptures, producing erosion. The erosion becomes crusted and resembles impetigo. The process is superficial and leaves no scars, and it recurs in the site of the original lesions. The areas of predilection are the sides of the neck, the axillary folds and other flexor surfaces.

The histologic structure is suggestive of both pemphigus and Darier's disease, showing intraepidermal vesicles, bullae and dyskeratosis. The basal cell layer remains attached to the cutis and there is oedema of the prickle cells. There is hyperkeratosis over the vesicles and bullae, with separation of the outer layer of the epidermis from the stratum granulosum.

Atabrine Dermatitis.—A new and unusual eruption appeared immediately after the Buna campaign in New Guinea in 1943, among U.S. and Australian soldiers who were hospitalized in Australia. The disease became fairly common, was often generalized and occasionally fatal. In some respects it simulated lichen planus but was not typical of this disease and at the outset caused differing opinions as to its nature. It was spoken of as "atypical lichen planus," "lichenoid dermatitis," etc., and by the soldiers as "New Guinea rot."

As the disease was invariably associated with ingestion of atabrine for the suppression of malaria, it was eventually agreed by the majority of medical officers that the essential cause of the eruption was this drug (quinine hydrochloride). Other factors, as suggested by Herbert S. Alden and Louis J. Frank, may have acted as a trigger mechanism, such as contact dermatitis, fungous infections, emotional fatigue, etc. While often spoken of as the New Guinea disease, the eruption was also eventually observed in the Mediterranean theatre of operations.

Publications by medical officers of the armed forces were not allowed until the end of hostilities with Japan. While reports were submitted to the medical department of the U.S. army in June 1944 by Charles L. Schmitt and John V. Ambler in Dec. 1944, and later by Frederick G. Novy, Jr. and others to the U.S. navy, none of them was allowed to be published at the time. The eruption included lichen planuslike patches, some of them suggesting the hypertrophic type, eczematous patches and occasionally exfoliative dermatitis. Most of the patients made a good, if at times slow, recovery on return to temperate climates. (See also Medicine.)

Detroit

For Detroit, the history of the decade 1937-46 was affected strongly by events of the depression years immediately preceding. No major United States city had suffered so acutely from public and private bankruptcy, unemployment and racial unrest. In the general bank holiday of 1933, the city's two largest financial institutions (mergers of numerous banks) did not reopen. The resultant losses not only modified the economic position of many great families of Detroit, but the economic situation of the entire community. Interest and principal on the municipal debt of \$275,000,000 were defaulted, property values subject to local taxation declined from a high of \$3,774,000,000 in 1931 to \$2,240,000,000 in 1936, the collection of property taxes declined to 65% of the taxes levied in 1933, and municipal obligations were met with script or simply not met. Approximately one-fourth of the population received public relief; a large, newly arrived Negro population pressed sharply on restricted housing facilities and employment opportunities; labour in the city's principal industry, the manufacture of automobiles, was unorganized but discontented and ready for radical leadership and direct action.

Thus the economic improvement which began with the decade and continued with minor interruptions throughout World War II and the reconversion period was marked by the entrance of many new personalities into the commercial and industrial life of the city, serious labour difficulties, the injection of labour into local politics, and the further influx of Negroes, which resulted in a series of "incidents," some of major significance. On the other hand, property values were partially restored, the public debt was refunded at a favourable rate of interest, and public finances were placed on a fairly satisfactory basis.

Labour difficulties were precipitated in 1937 by "sit down" strikes in the principal automobile manufacturing concerns. For a few days these strikes reached epidemic proportions in all industries and the distributive trades. Serious bloodshed was probably prevented by the refusal of the governor of the state, Frank Murphy, to call out the national guard. The situation was finally met by negotiation and in some instances by police action. The judicial

approval of the Federal Labor Relations act, after strikes in which the new "slow down" was introduced, brought about the complete unionization of labour within the automobile industry. One important manufacturer (Ford) reversed its previous policy and granted complete recognition to the union. The war years witnessed numerous unauthorized ("wildcat") stoppages of work and some jurisdictional conflicts, but these were of small proportions and for limited periods.

During the decade, business activity reached an all-time high with a substantial increase in population. Peace brought an abrogation of labour's "no-strike" pledge and the introduction of another new labour technique, an embargo against a single manufácturing concern, while permitting its competitors to operate, coupled with a proposal to base wages on profits. This type of strike against the General Motors corporation lasted 137 days and was finally settled by granting substantially the same wage increase as in other important industries throughout the country. Because of numerous minor strikes and work stoppages among suppliers of parts and materials, reconversion of the automobile industry to a peacetime production was materially delayed. There was a decrease of white population, and it was estimated that all later growth in population was because of the influx of Negroes.

During the war period, the rapid conversion of the automobile industry to the production of munitions and the existence of comparative industrial peace resulted in a soaring output of war materials. Old plants were enlarged and new ones established in the metropolitan area, particularly for the manufacture of tanks and aeroplanes. As a result, Detroit earned deservedly the title of "the arsenal of democracy." At the close of World War II one large aircraft plant was transferred to a newly organized motor car manufacturing company. The company (Kaiser-Frazer) was not yet in important production at the end of the decade, but it had become a possible new competitor for the automobile industry's "Big Three."

Success in the industrial field prompted organized labour to enter municipal politics through the local unit of the C.I.O. Political Action committee. In 1937 a labour candidate, Patrick H. O'Brien, lawyer, prominent in politics, was entered for the office of mayor as well as five prominent labour leaders for the city council. In the resulting nonpartisan election all these candidates were defeated and, also, officials highly critical of the labour and relief attitude of the previous administration took control of the state. Two years later a labour-endorsed candidate, Edward J. Jeffries, Jr., was elected mayor, and the victory was given publicity as a seizing of the administration by radical labour.

The newly inducted mayor repeatedly affirmed independence of any faction, which proved to be the case. In 1945 the C.I.O. Political Action committee was again active in the mayoralty and councilmanic campaign. A national official of the C.I.O., Richard T. Frankensteen, was successfully nominated for the office of mayor, but was defeated in the subsequent election, as were all labour candidates for the council except one incumbent member. Yet the alliance of labour with the Democratic organization gave the combination victory in most partisan political contests, particularly in county elections and the selection of representatives for the state legislature.

During the decade the city government was well administered from a financial point of view. Most of the public debt, which had been refunded after the earlier default

in 1933, was re-refunded at a lower rate of interest, a current operating deficit was slowly eliminated, and a substantial surplus was set aside for public improvements to help counteract any postwar recession in industrial activity. During the first year of the postwar period it was impossible to undertake any important public construction work. The city, however, planned projects that exceeded those of any U.S. city except possibly New York.

Even under these circumstances, rising costs pressed on the relatively fixed real estate tax of the city, and it assumed leadership in a movement to secure a distribution of state revenue to local units of government.

In spite of pride in an effective nonpartisan local government, two graft scandals attracted attention during the decade—one in the county and one in the city government. A suicide note left by the wife of a petty gambler in 1941 precipitated a grand jury inquiry into official protection of gambling by county officials. As a result a number of county officials, including the prosecutor, sheriff and a number of minor personnel were convicted and sentenced to the state penitentiary. This investigation led to a similar inquiry into municipal conditions and resulted in the conviction of the mayor, several councilmen and numerous police officials. Proud of its reputation as a well-governed community, Detroit could only reply to critics with the statement that it convicted its dishonest officials. The investigator in the inquiry, Judge Homer Ferguson, was eventually elevated to the U.S. senate and took a promment part in postwar inquiries.

At the opening of the decade occurred the "Sweet incident" which resulted when a prominent Negro physician moved into a white neighbourhood. A mob threatened the Negro home, and shootings with several injuries resulted. The resulting court action was inconclusive. Later there were demonstrations when Negroes accepted a housing project located in a white neighbourhood. In 1943, the Negro-white antagonisms flared up again as a result of housing congestion, discrimination in certain war plants, unsatisfactory social conditions and the pre-empting of certain public recreation facilities by Negroes. A riot broke out in one of the city's parks and extended rapidly to the Negro district. The immediate cost was the loss of 34 lives, 1,000 persons injured and \$2,000,000 in property destroyed, with incidental losses from absenteeism and extra governmental costs.

The city administration established an inter-racial commission intended to measure the degree of racial tension and suggest possibilities of relief. Negro political interest swung sharply in favour of the Democratic-labour group.

De Valera, Eamon

De Valera (1882—), Irish statesman, was born Oct. 14, 1882, in New York city of Spanish-Irish parentage. After the death of his father, he was sent to County Limerick where he was brought up by his grandmother. A mathematician by profession, he became a member of the Gaelic league and was the only surviving leader of the Easter week rebellion in 1916. Sentenced to life imprisonment, he was amnestied the following year and became

Eamon de Valera conversing with Dr. Vincenzo Berardis (right), Italian minister to Eire, after the latter had presented his credentials in Dec. 1938

president of the Sinn Fein government. Re-arrested in 1918, he escaped in Feb. 1919 and went to the United States to raise funds for the Irish republic, of which he had become president.

De Valera, who became president of the executive council and minister for external affairs of the Irish Free State in 1932, issued in April 1937 the text of a proposed new constitution for Eire which was approved by a majority of voters in the general elections of the following July. When the new constitution came into effect, De Valera automatically became prime minister. At the start of World War II, he pledged Eire to "absolute neutrality." His vigorous opposition to extension of conscription to the six Ulster counties caused Britain to drop the proposal in May 1941. In the national elections of June 1943, his party, the Fianna Fail, lost its majority in the lower chamber of the Irish parliament. Although De Valera was re-elected premier on July 1, 1943, his failure to win a vote of confidence in the Dail Eireann in May 1944 caused him to call for dissolution of the chamber and new elections. In the balloting on June 1, 1944, the Fianna Fail won control of the Dail and on June 9, De Valera was re-elected. In a broadcast to the U.S. on Mar. 17, 1946, De Valera also explained that Eire had embarked on a policy of neutrality during World War II because it was the only course open to a small nation.

Devers, Jacob Loucks

Devers (1887—), U.S. army officer, was born Sept. 8, 1887, in York, Pa. Upon graduating from the U.S. military academy (1909), he was commissioned a second lieutenant in the field artillery. During World War I he was first an artillery instructor and later an executive officer at Fort Sill, Okla. He then spent five years as an instructor of

military tactics at West Point and was a division commander. In 1939 he became chief of staff in charge of mechanization of the Panama Canal defenses, and in 1941 commander of U.S. armoured forces at Fort Knox, Ky. He was made a lieutenant general Sept. 1942, appointed commander of U.S. forces in Europe May 1943, and deputy commander in the Mediterranean theatre the following December. Devers commanded Allied forces that landed in southern France (Aug. 15, 1944). A month later he was given command of the 6th army group comprising U.S. and French troops, relinquishing his post as deputy commander in the Mediterranean in Oct. 1944. The 6th army group participated in the all-out Allied offensive that ended in the collapse of the reich, May 7, 1945. Devers. who had been appointed to the temporary rank of a full general (March 13, 1945), became commander of the army ground forces, June 29, 1945. One of the many army men supporting the proposal for a unified army-navy command, Devers declared that he would be willing to serve under a navy officer if one were appointed chief of staff to a civilian secretary.

On Jan. 22, 1946, Devers was promoted to the permanent rank of major general. On May 17 of the same year he denied before a house military committee that he had called congressmen cowards. He created another semi-sensation with an article appearing in a French weekly, Nov. 1, 1946, which said that the U.S. was keeping "27 divisions ready for action no matter where, one minute after the alert."

Dewey, Thomas Edmund

), U.S. lawyer and politician, was Dewey (1902born March 24, 1902, in Owosso, Mich. Graduated from the University of Michigan, Ann Arbor, Mich., in 1923, he received his law degree from Columbia university, New York city, in 1925, and was admitted to the New York bar the following year. As U.S. attorney for the southern district of New York, Dewey attained nation-wide prominence for successful prosecutions of gangsters and criminals. Elected district attorney of New York county in 1937, he ran for governor the following year on the Republican ticket and was defeated by only 64,000 votes. Dewey was mentioned as one of the leading candidates for the Republican candidacy in 1940, but was among the losers in the unexpected nomination of Wendell L. Willkie. Two years later he ran again for governor of New York, this time winning. In 1944 Dewey again cast his hat into the ring for the Republican nomination for president and was named on the first ballot at the party's convention in Chicago, June 29. Although defeated in the election, Dewey received more than 22,000,-000 votes. While many had believed that his political star had declined with the 1944 defeat, Dewey re-emerged as a strong presidential possibility for the 1948 elections, particularly after his re-election as governor in 1946 by a 680,000-vote majority. A test of Dewey's popularity in that election resided in the fact that he carried New York city, generally heavily Democratic.

Diabetes

Throughout the world, diabetes had been found to occur more frequently in urban than in rural communities and still more than in sparsely settled regions. Yet even when reported mortality figures had shown an incidence in one section of a country to be one-fourth that in another, carefully conducted morbidity surveys proved the disease to be equally common when allowances were made for age distribution, sex, race, obesity, availability of medical supervision and accurate statistical reports. Thus, in

the "territories" of Argentina, the mortality rate in 1941 was 6.6 per 100,000, but in 1943 in Buenos Aires it was 15.0 per 100,000. In Guatemala, the rate was 0.7 per 100,-000 in 1943, but it was significant that there were some 300 physicians in that country, of whom there were about 220 practising in Guatemala City, with a population of about 220,000. Thus, there were only 80 physicians for the remaining 2,800,000 inhabitants, of whom some 70% or 75% were Indians. In the United States in 1940 the crude death rate in the urban part of the registration states was 32.2 per 100,000 in contrast to 19.3 in its rural areas, the excess of the urban rate over several years being approximately 67%. In one state, Arizona, the rate was 10 per 100,000. But when one took account of age, sex, availability for medical care and statistical evaluation, the morbidity of diabetes proved to be as frequent in Arizona as in the state of Rhode Island on the eastern seaboard, where the rate was 42 per 100,000, or four times as great. In fact, diabetes occurred with approximately the same rate among the Indians as in the remainder of the inhabitants.

Among Jews the incidence had often been considered as two and a half times that among gentiles, but data obtained in Berlin just prior to World War II, and in the Boston area through U.S. selective service examinations, suggested that this estimate was too high. Among the Irish in the United States, but apparently not in their home country itself, Northern or Southern Ireland, the diabetic frequency was above the average.

In 1938 the total number of diabetics in Germany was estimated at 300,000; in 1939 in England, according to R. D. Lawrence, 150,000 to 200,000. In the United States, estimates for 1946 ran between 575,000 and 625,000, but were calculated at 1,000,000 by E. P. Joslin for its 140,-000,000 inhabitants, or 1 in 140. To arrive at this figure, account was taken of the fact that many cases were never recognized; that in computing the mortality for the entire country the average death rate for the ten states with the highest mortalities was utilized as being more accurate than the average rate for the ten states with the lowest mortalities; that the statistically reckoned deaths from diabetes represented but two-thirds of those actually dying with but not from the disease (as had been proved by analysis), and thus the number of reported deaths had to be increased by one-half; and finally that the average duration of the disease was 15 years, and that this factor times the figure for total deaths of diabetics should be used in arriving at the total number of living diabetics.

In any calculations of incidence of diabetes, one must not forget that, in the most careful survey yet made, the frequency of diabetes varied from 1:2500 for those under 15 years of either sex to 1 in 70 males and 1 in 45 females for those 65 years of age and older, and that diabetic mortality had risen as a cause of death from 27th place in 1900 to 9th place in 1938 and to 8th place (7th barring accidental deaths) in 1943 in the United States of America.

Prolongation of Lives of Diabetics.—The lengthening lives of diabetics was generally recognized. For one private series of 3,234 fatal cases after Aug. 7, 1922, it rose on the average from 6.1 years to 14.1 years, or one diabetic year of life for each succeeding three years. The duration prior to the introduction of insulin in 1914–22 in this series was 6.1 years, but it rose to 11.3 years for the period Nov. 1, 1937–Dec. 31, 1939, and again to 14.1 years for the period Jan. 1, 1944–May 15, 1946. The average age at death of diabetics was 46.7 years until the introduction

of insulin; it rose quickly to 60 years in the period between that date and Jan. 1, 1930, and to 64.8 years between Jan. 1, 1937, and March 29, 1940, but was 64.5 years between that date and May 15, 1946. Obviously this increasing age at death could advance but little more, because it approached that of the non-diabetic population. The increasing duration of diabetes, however, could continue because of the lessened diabetic mortality, particularly of younger people.

Average Duration of Life Subsequent to Onset of Diabetes

Among Deceased Ex-patients								
Age Periods	Nov. 1, 1937-	Jan. 1, 1940-	Jan. 1, 1944–					
of Onset	Dec 31, 1939	Dec. 31, 1943	May 15, 1946					
	No. of Duration	No of Duration	No. of Duration					
	Cases Years	Cases Years	Cases Years					
All ages	1,229 12.4	1,354 13.3	651 14.1					
0 - 9	16 11.3	19 9.4	15 16.7					
10 - 19	32 9.0	39 12.7	31 13.2					
20 - 39	127 16.7	172 17.9	70 17.9					
40 - 59	673 13.9	700 14.8	328 16.2					
60 and over	380 8.7	424 9.3	200 9.3					

The statistics in the accompanying table are based for definite periods, but they represent statistics of duration gathered from fatal cases. How different, this might be from the average total duration of all in each group was

Laboratory class at the diabetic unit of the Hutton Residential school in Essex, Eng., training youngsters from 6 to 16 to do their own sugar tests and to administer their own insulin injections. The unit was formed as an answer to their special needs during wartime

shown by a comparison of the duration of diabetics for earlier periods. Thus, the duration for patients dying in the years 1898–1914 was 4.9 years, but including cases dying subsequently or alive in 1946, it was 9.6 years. The figures from 1914–22 similarly changed from 6.1 years for fatals in those years to 12.8 years when subsequent deaths and survivors were used for computation of the average duration of life. From 1922 to 1930, similarly, the duration changed from 8.1 to 14.9.

Despite the prolongation of the lives of diabetics generally and particularly of youth, the seriousness of the disease was demonstrated by the development of arteriosclerotic complications in the later lives of those who acquired the disease in childhood, i.e., under 15 years of age. In one series of 249 such cases of diabetes of 20 or more years' duration, there were 70% with such arteriosclerotic complications in the eyes, heart or kidneys. Another writer, reviewing a much smaller number of cases in another country, recorded even more serious findings and concluded that few if any such childhood diabetics would survive 20 years of diabetes with a good degree of health. Such a statement was unduly pessimistic, because 30% in the former series of 249 cases were in good condition. Nevertheless, the lesson was plain-that more aggressive treatment was required if the health of the 20-year diabetic child was to be preserved.

The U.S. public health service entered the field of diabetes in 1945. This national recognition of the importance and magnitude of the diabetic situation was fraught with great possibilities. Obviously the government would need better statistics regarding diabetes and not only would compile them, but inaugurate surveys to improve their accuracy. At the beginning of the decade 1937–46, estimates of the number of diabetics in the United States seldom reached 500,000; in 1946 they approached 1,000,000.

Physiology.—Research in many laboratories throughout the world continued to enrich knowledge regarding diabetes and related problems, although work of fundamental nature was of necessity curtailed somewhat during World War II. The outstanding advances are summarized below.

Endocrine Interrelationships.—In the several years just preceding the decade 1937-46, a long series of studies by B. A. Houssay and collaborators in Buenos Aires had shown that the anterior pituitary has a profound influence on carbohydrate metabolism and exerts a powerful antiinsulin effect. The results of this study were amply confirmed and extended by other investigators the world over. In certain species it was shown that hypophysectomy produces hypoglycaemia in normal animals and ameliorates the diabetic condition of depancreatized subjects. Houssay, and in the United States H. M. Evans and others, found that the injection of crude extracts of the anterior pituitary into normal animals caused hyperglycaemia and glycosuria. However, it remained for F. G. Young, working at the National Institute for Medical Research in London, to demonstrate conclusively in 1937 that by such a procedure, permanent diabetes was produced in normal dogs. In such animals, widespread destruction of islet tissue occurred and the insulin content of the pancreas became extremely low or essentially lacking. Following this, C. N. H. Long and F. D. W. Lukens in Philadelphia showed that removal of both adrenal cortices ameliorated the diabetic condition of departreatized animals. However, it was generally accepted that the role of the adrenal cortex is not as important in carbohydrate metabolism as is that of the anterior pituitary which appears to be dominant. The influence of the thyroid is even less direct but in suitably prepared animals, the administration of thyroid extract may produce a diabetic-like condition (Houssay). These findings led to much speculation as to the role of the anterior pituitary, adrenal cortex, thyroid and gonads in the origin of the diabetic state. It was generally acknowledged that an important, and without doubt fundamental, relationship to human diabetes existed, but direct application was not as yet possible.

Prevention and "Cure" of Experimental Diabetes .- Of great interest to patients and physicians alike was the finding by F. D. W. Lukens and F. C. Dohan, by C. H. Best and co-workers in Toronto, and by others, that under certain experimental conditions, varying with the species of animal, the diabetic condition resulting from the injection of anterior pituitary extract might be prevented by the simultaneous administration of insulin, or less effectively, by the feeding of a diet low in calories or high in fat or by the giving of phlorhizin. Furthermore, even though these measures were not introduced until diabetes had developed, "cure" of the condition could be effected provided the remedial measures were introduced early enough. i.e., before irreversible changes had taken place in the pancreas. Lukens pointed out that the only clear similarity of the action of these measures lay in the abolition of hyperglycaemia. He suggested, therefore, that the level of the blood sugar may play an important part in the pathogenesis of diabetes.

Formation and Breakdown of Glycogen.-In logical sequence to the above studies were the results of investigations carried out by C. F. Cori and associates in St. Louis. Cori showed in 1939 that, under the influence of an enzyme, phosphorylase, a polysaccharide indistinguishable from glycogen could be synthesized in vitro from glucose-1phosphate, even in the total absence of insulin. Later in Cori's laboratory it was shown that the activity of another enzyme, hexokinase, in the reaction of adenosine triphosphate with glucose to form glucose-6-phosphate and adenosine diphosphate was inhibited by anterior pituitary extract. This was accomplished either by adding anterior pituitary extract to the enzyme preparation in vitro or by injecting rats with anterior pituitary extract prior to the preparation of the tissue extracts. Insulin counteracted this inhibition either in the living animal or in the test tube, although insulin itself did not enhance hexokinase activity under the experimental conditions employed. It was suggested that insulin and anterior pituitary extract exert their action by affecting the sulfhydryl balance of hexokinase.

It may be that the chief function of insulin is to facilitate the hexokinase reaction, thereby admitting glucose to the metabolic system. However, final judgment could not be passed, and there may well be other sites of action. The results of certain studies suggested that, in the chain of catabolic steps leading from glycogen to pyruvic acid and finally to carbon dioxide and water, the site of action of insulin is higher than the pyruvic acid stage.

Radioactive Isotopes.—Only a beginning was made in the use of radioactive isotopes as tracer substances in the study of intermediary metabolism. Since such compounds possess identical chemical properties and yet have different physical properties caused by differences in atomic weight, an element in the diet, such as carbon, can be followed in metabolic processes in the body by incorporating a radioactive isotope as C¹¹ or C¹³, in substances fed or injected. The pathway of the carbon compound which has been introduced into the body can be traced by detecting the presence of the isotope in a particular site.

Formation of Ketone Bodies.—Particularly during the decade 1937-46, ideas changed greatly as to the chemical

steps by which ketone bodies are formed from fat. The Knoop theory of "successive beta oxidation" was discredited by most workers in favour of W. H. Hurtley's suggestion of "multiple alternate oxidation" or the "beta oxidation acetic acid condensation" hypothesis of E. M. MacKay and co-workers. W. C. Stadie did much to clarify concepts in this field. He furnished evidence to indicate that the catabolism of fat involves, at least in part, preliminary oxidation in the liver to ketone bodies. In the normal or the diabetic animal, the ketone bodies may be utilized for energy in the peripheral tissues without the aid of insulin and without simultaneous oxidation of carbohydrate. However, when the production of ketone bodies is abnormally great, as in uncontrolled diabetes, the capacity of the body for utilization is exceeded, and the excess ketone bodies accumulate in the blood stream and are excreted in the urine.

Lipotropic Substances.—Lipotropic substances are those which prevent or remove excessive fat in the liver. They are of great importance in maintaining normal fat metabolism in animals with experimental diabetes and probably also in human diabetes. Three such factors are recognized: choline and related compounds, as methionine; lipocaic; and inositol. The work with choline was initiated by C. H. Best in Toronto and that with lipocaic by L. R. Dragstedt in Chicago.

Alloxan Diabetes.—Three methods were available at the end of the decade for the production of diabetes in experimental animals: removal of at least nine-tenths of the pancreas; injection of extracts of the anterior pituitary; and the injection of alloxan, the ureide of mesoxalic acid. J. S. Dunn, H. L. Sheehan and N. G. B. McLetchie of Glasgow were the first to show that alloxan selectively destroys the beta cells of the islands of Langerhans of the pancreas. Permanent diabetes was subsequently produced in rabbits by C. C. Bailey and O. T. Bailey and in dogs by M. G. Goldner and G. Gomori. Alloxan diabetes was likewise produced in the rat, monkey, pigeon and turtle. Degenerative changes in the islet cells were detected as early as five minutes following the injection of alloxan, and microscopic sections of the pancreas at 24 hours usually revealed a collar of intact alpha cells at the periphery of the islets surrounding a mass of destroyed beta cells. Unless unnecessarily large doses of alloxan were employed, changes in organs other than the pancreas are usually minimal and reversible except that, as in the rat, tubular damage in the kidney might be found. Two drugs closely related to alloxan were shown to produce similar islet lesions and diabetes. O. Koref and associates of Chile reported that alloxantin produces diabetes in rabbits, and G. Bruchmann and E. Wertheimer of Jerusalem found that dialuric acid produced diabetes when injected into rats. Alloxan is an extremely reactive substance which can be detected in the blood for not more than five minutes after its intravenous injection and may be recovered from the pancreas within two minutes. Whether or not alloxan is an etiological factor in human diabetes is unknown, but highly suggestive is the fact that following its injection into animals there is a decrease in the reduced glutathione, cystine, and cysteine content of the blood. These changes in sulphur-containing compounds may well be of significance since certain enzymes important in carbohydrate metabolism are dependent upon sulfhydryl groups for their activity.

Pathology and Causes of Death.—Much attention was concentrated especially in experimental diabetes upon the

reversible lesions of the pancreas and the capacity of the pancreas to regenerate with corresponding emphasis upon the possibility of improvement and even cure of the disease. It was shown that the islets of Langerhans degenerate after injections of anterior pituitary extract, but that in experimental animals recovery from the lesions so produced may occur if insulin was used early enough. In contrast, a pancreatropic factor, derived from the anterior pituitary was also demonstrated which increases the number and volume of the islet cells.

Considerable variations in the amount of insulin present in the pancreas of different species were demonstrated. As methods for recovery of insulin improved, the possibility of clinical measurement of circulating insulin in the blood seemed less remote. A considerable number of tumours made up of islands of Langerhans were reported and many with successful surgical removal. The symptoms produced by these tumours are of great importance in diagnosis in relation to clinical medicine and psychiatry.

Improvements in treatment and increasing duration of life of diabetic patients brought changes in the causes of death. Prior to 1914, diabetic coma caused three-fifths of all deaths, but in the period 1944–46 only 3% of 651 deaths were due to coma. As coma disappeared, arteriosclerosis became more prominent so that in the years 1944–46, 67% of all deaths were due to arteriosclerotic cardio-renal vascular disease.

The Kidney in Diabetes.—The description of intercapillary glomerulosclerosis in diabetic patients with high blood pressure directed attention to the frequency and importance of kidney lesions in diabetes. Although arteriosclerosis, particularly of the eyes, heart and the legs, had long been one of the most outstanding findings in diabetic patients, this new lesion in the kidney seemed of special diagnostic importance. The lesion was described as deposits of hyalin in the kidney glomeruli, occurring much more frequently in its advanced form in diabetic patients than in nondiabetic patients.

Medico-Legal Aspects.-Medico-legal aspects of diabetes proved to be of importance in relation to (1) possible causation of the disease or its aggravation by trauma; trauma was only considered a cause of diabetes in rare instances when the trauma seriously injured the pancreas itself; (2) Special hazards of diabetes such as acidosis, infection and arteriosclerosis with their influence upon the occurrence of accidents and the healing of injuries; (3) Effects of insulin, particularly in overdoses; during hypoglycaemia patients may be confused, obstinate or wildly belligerent, and confusion with alcoholism may lead to serious errors; (4) Diagnosis of diabetes at autopsy. The most valuable diagnostic evidence was considered to be: changes in the islands of Langerhans, abnormal deposits of glycogen in liver and kidney tubules, and characteristic advanced lesions of intercapillary glomerulosclerosis.

Diabetic Coma.—Improvement in the results of treatment of diabetic coma continued during the decade. A striking decline in mortality occurred when insulin was used more aggressively during the first three hours of treatment. In the first few years after the discovery of insulin, patients treated in one hospital for diabetic coma received on the average only 83 units in the first three hours of treatment, and 12% died. Between 1940 and 1946, among 173 cases of diabetic coma treated in the same hospital, the average insulin given in the first three hours was 212 units; 3 deaths occurred, a rate of 1.7%. In this group were some unconscious patients who received from 300

to 1,000 units during the first three hours of treatment. The amount of insulin given in the first few hours of treatment had the greatest influence upon the results of treatment, and this was especially true in the presence of infectious complications.

Chemical alteration in the blood and urine during diabetic coma were studied particularly in relation to ketosis, dehydration and shock. Blood sugar levels from 500 mg. to 1,500 mg. per 100 cc. and concentrations of acetone bodies from 100 to 200 mg. per 100 cc. were reported in unconscious patients. Dehydration and shock, often with renal failure, were associated with a considerable loss of base, chiefly sodium and potassium in the urine with resultant deprivation of base in the tissue cells.

Patients profoundly unconscious were reported as in far greater danger than those who had not yet reached that stage. From 35% to 75% of such unconscious patients treated prior to 1940 died. The mortality in 39 unconscious patients in one series treated between 1940 and 1946 was reduced to only 10%.

Success in treatment of coma depended upon the early use of insulin. Secondly, dehydration was counteracted by the administration both intravenously and subcutaneously of normal salt solution in amounts up to 10% of body weight. The amount of fluid given in the first 24 hours varied with the extent of dehydration. A patient completely anuric received a litre per hour for 12 hours, but most patients with diabetic acidosis required not more than 3 to 5 litres in the 24 hours. The need for administration of food as soon as sufficient insulin had been given was met by oral or by intravenous feeding, as the patients' condition permitted.

Arteriosclerosis.—With the increasing length of life of diabetic patients, advanced occlusive arteriosclerotic complications became the outstanding feature of diabetic morbidity and mortality rates. Chronic renal disease, including intercapillary glomerulosclerosis associated with diabetic retinopathy, appeared increasingly important, especially in young patients with diabetes of long duration.

The heart became the chief site of advanced arteriosclerosis, and coronary disease the chief cause of death in diabetic patients. The striking feature of coronary arteriosclerosis in diabetic patients was found to be the almost equal distribution by sex in contrast to the excessive predominance of males in nondiabetic patients with angina pectoris and coronary occlusion.

Surgery and Diabetes.-Improvements in the results of surgery carried out upon diabetic patients were as remarkable as in nondiabetic surgery. The increasing duration of life of diabetic patients brought a larger number of patients into the age period where complications caused by peripheral vascular disease, neoplasms, prostatic surgery, etc., were more common. The introduction of the sulfonamides was an advance, but the use of penicillin even more strikingly improved the prognosis for surgery, particularly in carbuncles and infections of the extremities. Actually at one hospital the operative mortality was 7.3% for 3,551 operations from 1923 to 1941, whereas from 1942 to Jan. 1, 1946, the operative mortality fell to a new low point of 2.2% in 1,453 operations. In addition to the use of penicillin for the control of septic infections, the introduction of new methods for improving nutrition were of value in the group of seriously ill patients suffering from malnutrition. Long periods of uncontrolled diabetes not merely produced loss of weight, dehydration and frequently acidosis, but also significant losses in protein, base and disturbance in vitamin metabolism. Factors common in diabetics such as achlorhydria, diarrhoea and symptoms associated with the surgical complication itself often resulted in a patient's arriving at the hospital in a partial state of starvation. In addition, therefore, to control of the diabetes, the parenteral use of vitamins and particularly the treatment of hypoproteinemia were of mæterial benefit in the improvement of the surgical outcome. The former fear of surgery with its consequent postponement until the risks of surgery had greatly increased gave way to confidence, so that a diabetic patient was able to secure all the benefits of surgery provided he came to the surgeon at a sufficiently early stage of his condition and received proper diabetic management both before and after operation.

Pregnancy in Diabetes.—In any report upon advances in the treatment of pregnancy in diabetes, the statement of A. Bouchardat in 1875 that he had never seen a pregnant diabetic woman, and of B. Naunyn in 1907 that he had observed but one, should be recalled.

Obstetrical diabetes in the decade 1937-46 was a controversial problem. Two opposing views were held, namely, that the course of pregnancy in the diabetic woman is normal, or exactly the opposite, that no pregnancy is more abnormal than that of the diabetic. The latter view was maintained by Priscilla White of the Joslin Diabetic Group. She pointed out the obstetrical abnormalities in diabetic pregnancies, including an abnormal frequency of early spontaneous interruption of the pregnancy, preeclamptic toxaemia, breech presentation, ineffectual labour, failure of lactation, stillbirths and neonatal deaths. The foetus was found to be often large, oedematous and frequently developed a benign jaundice and malignant atelectasis. The liver and spleen showed changes not unlike those found in erythroblastosis. The placenta was often large or, quite the opposite, very small.

The production of the sex hormones, oestrin and progesterone, by the placenta appeared to be defective. As a result, fluid was retained in the body of the mother, in the foetus and in excess in the uterus. The loss of sugar in the urine of the mother was disproportionately great compared with the level of her blood sugar, favouring either hypoglycaemia or acidosis. Pregnancy was further complicated by the maternal ovarian deficiency and vascular disease.

All of these abnormalities contributed to the previously reported foetal mortality rate of 50% but in Dr. White's experience the imbalance of the placental hormones appeared to be the most important single harmful factor. In her series of 293 patients studied between Jan. 1936 and July 1946 there were 68 patients whose hormonal balance was normal; 97% of their infants survived; none was born prematurely and only one patient had preeclamptic toxaemia. Among 58 abnormal cases-abnormal so far as the balance of the sex hormones was concerned-31 infants died; 50% of the mothers had pre-eclampsia and 40% delivered prematurely. The deficient hormones, oestrin and progesterone, were supplied to the remaining 167 patients; 18 of the infants of these patients died, only 5% of the mothers developed pre-eclampsia and but 15%delivered prematurely.

Good treatment and control of diabetes with high carbohydrate diets (180 g. to 220 g.), high protein diets (2 g. per kg. of body weight) with little salt was indicated for pregnant diabetic women. Insulin should be administered several times during the day in addition to the initial dose of crystalline and protamine insulin usually administered before breakfast.

A timed delivery in the 38th week of pregnancy proved

desirable. Caesarean section was usually indicated to bring about early delivery. General anaesthetics and sedation had to be avoided because of their depressing effect upon infants' breathing. Spinal anaesthesia was preferred.

Hormones were usually administered by intramuscular injection daily in ascending doses from 5 mg. each of stilboestrol and proluton daily up to 30 mg. of each.

The infant of a diabetic mother was protected at birth with oxygen, incubation, drainage, suction of the upper air passages, stimulation and dehydration, even more than the child of the nondiabetic.

In summary, as a result of maternal, vascular and ovarian dysfunction, the course of the pregnancy in the diabetic is abnormal. Replacement of lacking sex hormones, oestrin and progesterone, brought about a change in foetal survival from the low level of 50% up to 90%. The maternal survival should be that of nondiabetic obstetrical experience. The only maternal death occurred 60 days after delivery.

Treatment.—The efficacy of insulin and its modifications, protamine insulin, protamine zinc insulin, globin insulin and other experimental insulins was shown by the lengthening duration of life of diabetics at all ages and by the spectacular fall in diabetic coma. In fact, insulin medication had become so effective a therapeutic agent that one should not overlook the fact that the increased carbohydrate, 150-200 g. at the end of the decade instead of 100-150 g. at its beginning, and more calories, consistent with the increased activities of the patient, also exerted a notable effect on the diabetes situation. A still higher carbohydrate diet and a correspondingly lower quantity of fat in the diet were not employed over sufficiently long intervals to warrant conclusions. Early and aggressive treatment of the disease following its onset frequently led to surprisingly good results. Insulin also allowed the patient to profit to the full by nondiabetic discoveries such as the sulfa drugs and penicillin. In short, the treatment of the disease per se changed little during the ten-year period. The prompt use of insulin in the first 3 hours instead of in the first 12 or 24 hours of diabetic coma was perhaps an exception. The condition of the long-duration case of diabetes beginning in childhood represented the crux of the problem. In 1946, 70% of these 20-year duration cases showed arteriosclerotic complications. Hepatomegaly in youth disappeared with the advent of protamine zinc insulin.

Protamine zinc insulin controls the blood sugar of most mild and moderately severe diabetics very well. With severe cases, however, its onset of action is not rapid enough to control the mid-morning glycaemia in many cases, which makes the injection of a supplementary dose of regular or crystalline insulin desirable.

Attempts to find an insulin which acts both quickly and for a prolonged period resulted in the use of insulin mixtures, modified protamine zinc insulin and globin insulin. Insulin mixtures were prepared by mixing larger amounts of crystalline (or regular) insulin with a smaller amount of protamine insulin either in an oversized vial or in a syringe before injection. A. R. Colwell found that a ratio of two parts crystalline to one part protamine controlled the diabetes in 85% of his patients. The resulting mixture was not buffered and possessed both rapid and longacting properties. It was claimed that by varying the ratio of crystalline to protamine insulin in the mixture, the amount of rapid and prolonged action in the resulting preparation could be controlled.

Modified protamine insulin, an experimental insulin, was buffered to neutrality and contained approximately one-fourth rapid action and three-fourths prolonged action. Evidence suggesting that the rapid insulin in this preparation might not be stable was found in that older samples might contain proportionally less free insulin than fresh samples. Efforts to make this insulin stable were continued by C. M. MacBryde.

Globin insulin, a clear acid preparation, made by combining globin from beef haemoglobin with insulin, has a more rapid but less prolonged action than protamine zinc insulin. Its tendency to produce frequent afternoon insulin reactions, unless a mid-afternoon lunch is taken, greatly limited the usefulness of this insulin.

Vitamins did not replace insulin and did not cure neuritis, but they were used freely if the slightest vitamin deficiency was detected and even prophylactically in the hope of preventing this occurrence. Vitamin deficiencies may occur in diabetics as in nondiabetics, but clinical deficiencies were not frequently seen. The average discharged diabetic diet in one large clinic had three times the amount of vitamins A and C, and optimal thiamin and niacin recommended by the Committee on Foods and Nutrition of the National Research Council. Despite this, supplementary vitamins were frequently prescribed, especially if the diabetic patient had any complications, such as neuritis or diarrhoea, or if the food intake for any reason was below normal. The increased capillary fragility commonly reported in diabetics was seldom corrected by vitamin C therapy. Whether the diabetic utilizes vitamins as well as the nondiabetic remained unknown, but it would seem advisable to give the diabetic a more liberal intake of vitamins.

A wider knowledge of medicine was needed in the treatment of diabetes because, by the end of the decade, diabetic patients were living so long that they were exposed to complications which the short time of duration previously did not allow. Deaths from cancer among diabetics, for example, had risen from 1.8% to 8.3%.

Diamonds

World War II brought a major upheaval to the diamond industry-not in throttling it as the producer of a superfluous luxury, but by demanding more of its product than could be produced. Being dispensable as a luxury, the gem diamond received scant attention, and for the time being became little more than a by-product in the race for the recovery of its plebeian brother, the industrial diamond. The war quadrupled the demand for industrial diamonds, on top of a tenfold increase that had developed during the prewar decade, with the result that demand greatly exceeded production. In the United States alone, imports of industrial diamonds during 1941-45 were greater than the world output of all diamonds in the same years; hence it was evident that only a fraction of the war demand could have been supplied except for the large stocks of industrial stones that had been accumulated before 1930, when industrial uses absorbed only a small part of the output. These stocks, though large, were drawn upon so heavily that they were becoming depleted, especially in certain grades. That demand was expected to continue at a high level was evidenced by a marked expansion of output in 1945 in Belgian Congo, the chief producer of industrial stones, and by the fact that South African producers were preparing to reopen mines shut down in the 1930s because their output carried higher percentages of industrial stones than those mines kept in operation.

World Production.—Production data were difficult to secure from many countries during the war years. Table I presents the data as collected or estimated by S. H. Ball in *Minerals Yearbook*.

The 1945 output was a record figure, exceeding the 1940 high by almost 10%, and the 1944 total by 22%, because of heavy increases in Belgian Congo and South Africa.

The Presidente Vargas diamond, third largest known at the time of its discovery, in uncut proportions, shown beside a ruler. Cutting operations began in New York city April 9, 1941, after a year of study by diamond experts

Sales of rough stones by the Diamond Trading Co., which normally handled about 95% of the world output, reached a record valuation of £24,500,000 in 1945, as compared with £9,151,200 in 1937, and £6,144,000 in 1940, the year in which distribution was disorganized by the German occupation of the Belgian and Dutch cutting centres.

Cutting.—With the German invasion of Belgium and the Netherlands, the extensive cutting industries centralized at Antwerp and Amsterdam were almost entirely disorganized. The occupation forces attempted to keep a small industry going, but with little success, since there were few skilled workers left and the supply of rough stones was limited to the few that could be obtained in French Africa or bought chandestinely in South America.

To replace the cutting facilities lost in the Low Countries, the small cutting centres already in operation in the United States, Great Britain, South Africa and elsewhere were enlarged, and new centres were established in Palestine and Cuba. Much of this expansion was made possible by the participation of operators and workers who had escaped from the Low Countries ahead of the German occupation, and in many cases operators were able to take with them their stocks of rough and cut stones.

There was a considerable revival of cutting in Belgium after the close of World War II, but progress in the Netherlands was not so good. Using the 1945 U.S. imports of cut stones as a gauge of the status of the cutting industry in various countries, the order was Palestine, Belgium,

Cuba, South Africa, Brazil and Great Britain, for weight of stones imported. The varying type of work done in the different countries was indicated by the average value per carat of the U.S. imports, the higher values indicating larger and better stones; on this basis, South Africa headed the list, followed by Great Britain, Cuba, Brazil, Palestine and Belgium. Belgium had long specialized in the cutting of small stones, but a postwar shift was under way to larger stones, as was indicated by an average value of \$139 per carat in 1945, against \$54 in 1939.

The growth of the cutting industry in the United States could be measured roughly by the importation of 896,547 carats of rough stones in 1944 and 893,761 carats in 1945, as compared with 153,982 carats in 1939; at the same time, imports of cut stones declined from 488,154 carats in 1939 to 169,097 carats in 1944 and 377,243 carats in 1945. In 1939, the value of the rough imports was close to \$80 per carat; in 1945 it was only \$48, indicating the handling of a much larger proportion of smaller stones by the domestic cutting establishments.

United States Imports.—The United States remained the world's largest buyer of gem diamonds, with the highest values occurring in periods of high prosperity and easy money, as was to be expected with a luxury product. Even during the war years, the imports of gem diamonds were kept at a high level, especially after 1943. After 1933 the weight of industrial stones imported had greatly exceeded that of gem stones, but of course the value was much lower. Imports for 1937–45 are shown in Table II. (See also Mineralogy.) (G. A. Ro.)

Diatomite

Sales of diatomite in the United States increased from an average of 93,215 short tons in the period 1936-38 to 174,957 tons in 1942-44, with 1945 exceeding the 1942-44 level. Production was mainly from California and Oregon; other western states producing diatomite included Idaho, Nevada, Washington and Arizona, while in the east Florida and New York contributed small amounts. Use as a filter aid accounted for over half of the consumption, fillers for one-fifth and insulation for one-eighth.

Diatomite was produced in at least 25 countries, in most cases not exceeding a few thousand tons. After the United States the largest producers were Denmark, Germany, Japan and Algeria, with prewar outputs of 20,000 to 100,000 tons. (G. A. Ro.)

130 Dietetics

As the science of nutrition became established, the need for its application to the problems of feeding individuals and groups was apparent. In answer to this need, dietetics as a field of specialization was developed. During the decade 1937-46 it grew into a diversified field of work concerned with food and nutrition and such related activities as diet therapy, administration and management, community and professional education. The advances in dietetics, however, were directly commensurate with and dependent on the many brilliant discoveries in the field of normal nutrition. The isolation and synthesis of vitamins and amino acids permitted fundamental research which was basic to an understanding of normal nutrition. With this basic information, it was possible to study the interrelationships in metabolism. As a result, a new concept was presented of the need for complete nutritive efficiency both in health and disease.

With the acceptance of the concept that the feeding of the sick should be based on an adaptation of the normal diet, that simple phrase—feeding people—broadened steadily in significance. The field expanded to encompass not only all the food services of the hospital, but also outpatient services, public health, industry, restaurants (both commercial and industrial), schools and colleges, day nurseries, clubs, summer resorts, air services, the armed forces and the Veterans' administration facilities. The dietitian dealt with everything pertaining to the food department—planning, purchasing, food preparation and serving, care and purchase of equipment, employment of staff, cost accounting and instruction.

Diet Therapy.—One of the most far-reaching contributions was the development of more reliable tools for the quantitative evaluation of dietary requirements and the food intake. With improved methods for the chemical determination of nutrients, a substantial amount of evidence was collected giving gross indications as to the nutritional requirements and the composition of the food intake.

In the field of preventive medicine, studies resulted in a further clarification of the normal requirements during pregnancy, growth and old age. A gross guide to these new recommendations for various age groups was published in the Recommended Dietary Allowances, revised in 1945 by the Food and Nutrition board of the National Research council. This council was representative of experts in the specialized fields of nutrition in the United States and elsewhere. The value of these recommendations was fortified by the concurrent development of adequate tables containing representative values on food composition suitable for use in dietary calculations. New data on food composition were also compiled for African, Mexican and oriental foods.

In therapeutic medicine, the problems studied in connection with wound healing and with recovery from physical trauma and shock, as well as from fractures, burns, infections and starvation, resulted in many new discoveries regarding the value of a high protein diet. In studying the problems of convalescence, the use of a high protein diet was found to bring about a marked increase in the rate of recovery. This observation necessitated a reevaluation of the protein content of many hospital diets. In a re-study of cirrhosis of the liver, it was shown that dietary factors are of importance in pathogenesis and that the course of such diseases is benefited by feeding a diet

rich in protein and the vitamin B complex. In addition, work by Paul R. Cannon and associates indicated a direct correlation between the level of protein intake and the antibody mechanism. In fact, the level of protein intake was shown to determine both the acquisition and retention of specific resistance.

Where a high protein diet of 150 gm. or more daily was necessary, foods which contained concentrated amounts of protein were used. In some cases, protein hydrolysates provided a further source of protein. Suggested recipes and formulas for high protein diets were compiled by the Diet Therapy section of the American Dietetic association together with approximate values of protein supplements used. The compilation included formulas for high protein tube feedings, jejunal feedings and nasal feedings. Recipes were also included for the use of high protein foods in beverages, soups, candy, cookies, desserts, meat, bread and entrées.

With the use of improved methods of vitamin assay, it was discovered that the bacterial flora of the intestinal tract provide a significant source of vitamins of the B complex. However, the synthesis of vitamins by intestinal micro-organisms was found to be influenced in many ways. Certain changes in the internal environment were found to block intestinal synthesis entirely; on the other hand, certain factors, particularly food nutrients, were found to be favourable to the growth of bacteria. With a new appreciation of the complexity of the interrelationships of nutrients and the influences of these nutrients on bacterial flora, there was an added incentive for the use of natural rather than refined foods.

Another development of practical significance was the result of research on the acceptability of foods. It was much easier to formulate diets for optimum nutrition than to ensure the use of such diets by the patient. Every dietitian inescapably acquired the knowledge that it is not so much what goes on the plate as what goes into the stomach that counts—thus the increased emphasis on the selection and preparation of foods to meet the demands of varying food habits and tastes. Studies by the Committee on Food Habits of the National Research council indicated that still greater recognition was needed of the role which food plays in the religious, cultural, social and emotional life of the individual.

Administration and Management.-Dietitians entered the hospital organization primarily as teachers employed to teach nurses how to prepare the foods then believed to be necessary for sick people and to teach what was termed "diet in disease." Their sphere of activity in the beginning was limited to the diet kitchen. As the newer knowledge of nutrition became better understood and more widely accepted, and as educational facilities for the adequate training of dietitians became enlarged and strengthened, the dietitian's sphere of activity widened in scope. From teachers of nurses only, and from the small diet kitchen, dietitians advanced to administrative responsibilities concerned with food service to all patients and personnel. Thus, from positions limited in scope and responsibility, dietitians advanced to positions as heads of major departments directly responsible to the superintendent of the hospital. Large financial responsibilities, as well as those concerning health and social well-being, passed to the dietitian, who might spend from one-fourth to one-third of the total hospital budget.

Accompanying the greatly expanded industrial production program during World War II was a recognition on the part of management that the worker's health, and his or her presence on the job were matters of great concern.

As one measure toward greater employee efficiency, many industrial plants through their industrial relations division opened cafeterias for the use of all of their employees. Dietitians were employed by some to carry full administrative responsibility; others provided this food service through concessionaires, with dietitians as nutrition advisers. Some industries operated their cafeterias 24 hours a day so that all shifts could take advantage of good food served at low cost. The basic activities in administration and management included: general departmental policy making; hiring, training and maintaining a working force; planning work schedules and work procedures for all employees of the department; quantity food production, including menu writing and supervision of work procedures in the kitchen, bakery, pantries and other production units; financial management, including budget making, the maintenance of a food control system and a system of adequate reports and records; evaluation of the department as it affected patients, staff, personnel and tradespeople; and buying or requisitioning food and equipment by specification.

New materials for construction, new methods of construction and equipment with new purposes resulted from the necessity of meeting the needs of the wartime emergency. Many of these innovations were incorporated for civilian use.

New food processes also resulted from the uses during World War II. The use of precooked frozen foods by the navy air service proved the efficiency of this type of food processing. This development appeared likely to receive general acceptance in the management of food service departments. Improvements were also made during the war on dehydrated and canned foods which were of sufficient value to carry over into civilian use.

Community Nutrition.-At the same time that the dietitian was finding a place in the hospital organization and the science of nutrition was being developed by research workers, it became increasingly evident that scientific nutrition had as much importance in the maintenance of positive health as it had in the treatment of disease. The newer knowledge of nutrition, as it was developing, placed more emphasis on the need of an adequate diet for all people. Thus educators, quick to see greater opportunities for professionally trained people as this broader concept of nutrition service was being accepted, realized that the dietitian whose major emphasis in training was in the field of normal nutrition and dietary administration could serve usefully in public health services. The concept of adequate nutrition as a health and an economic factor in family life meant that the nutritionist was eligible for work in public and private health and welfare agencies, to interpret nutritional principles for individuals and groups. Because federal funds in the U.S. granted under the Social Security act and administered by the children's bureau of the department of labour were available to state, district, county and local health agencies for the enlargement of services to mothers and children, the nutritionist in these agencies worked in the division of maternal and child health. Formal nutrition teaching and consultant work took a major part of the nutritionist's time. Nutritionists taught in clinics, mothers' clubs and occasionally in public schools; they also taught professional workers in related fields of work, such as public health nurses, families and individuals requiring help.

During the war, the importance of nutrition in the prevention of disease was clearly demonstrated. The high level of wartime health in Great Britain was attributed in large part to the British nutrition program. Sir William

Jameson, Chief Medical Officer of the British Ministry of Health, gave credit to food planning for keeping the infant mortality rate the lowest on record and for the absence of serious epidemic disease despite bombings, mass evacuations and the strain of war.

In the United States, the nutrition programs branch of the War Food administration co-ordinated all nutrition activities. Representatives of agriculture, welfare agencies, community groups and health officers were brought together under this program. With the use of food controls, a higher nutritive content of the diet and a more equitable distribution of food resulted. A higher nutritive content was also due to the continuance of the enrichment of flour in the U.S. Thiamin, riboflavin and niacin as well as iron were added to refined white flour to bring it up to levels approximating those in whole wheat flour.

The continuance of the school lunch program with federal and state support in the U.S. also provided further insurance of adequate nutrition for children.

Nutrition surveys indicated that malnutrition was most prevalent among low-income groups. The congress of the U.S. made it possible for the public health service to set up demonstration units through the use of "nutrition teams" made up of a medical officer, a public health nurse, a dietitian or nutritionist and a biochemist, fully equipped with a mobile laboratory. The purpose of the mobile unit was to make nutrition appraisals and to develop methods and procedures particularly adaptable to health departments.

It was significant that the Food and Agriculture organization was the first permanent international body to develop from the wartime co-operation of the United Nations, being an outgrowth of the first United Nations Conference on Food and Agriculture at Hot Springs, Va., in 1943. It was recognized that each country should be responsible for providing its people with the food needed for life and health.

* * *

With the increased responsibilities for the dietitian went increased educational requirements; and with the increased educational requirements and the increased job responsibilities came recognition through the granting of professional status. The passage by the congress of the U.S., of Public law 828 (77th congress) of Dec. 22, 1942, gave new recognition and increased opportunities to dietitians. This bill granted relative rank and military status to dietitians assigned to the medical department of the army. Public law 350 (78th congress) of June 22, 1944, gave the dietitian full military rank. A qualified dietitian therefore was commissioned in the army of the United States with the rank of second lieutenant, eligible for promotion to the rank of first lieutenant. A few dietitians received the rank of captain and the highest ranking officer was a major.

In June 1944, the war department announced that 1,300 dietitians had been appointed for service in army hospitals. These dietitians were on duty in all theatres of operation, on hospital ships as well as in general, regional, station and convalescent hospitals in the U.S. Professional status was also accorded to dietitians in the Veterans' administration and in the U.S. public health service.

Lacking a legal registration of dietitians in the United States or a state examination for admission into the profession, it became common practice among professional organizations to accept as qualified only those dietitians

whose education and experience met the membership standards of the American Dietetic association. The movement toward clarifying the status and qualifications of specialists in dietetics and nutrition extended to other coun-

During 1945, the Board of Registration of Medical Auxiliaries in England published the first Register of Dietitians. (See also BIOCHEMISTRY; ENDOCRINOLOGY; VITAMINS.)

Dill, Sir John Greer

Sir John Dill (1881-1944), British army officer, was born at Belfast, N. Ireland, Dec. 25, 1881, and educated at Cheltenham college, Cheltenham, Eng., and at the royal military college, Sandhurst. He entered the army in 1901, was a brigadier major at the start of World War I, and emerged from that war with the rank of brigadier general and the D.S.O. for bravery. He was made lieutenant general in 1936. Sir John was commander of British forces in Palestine, 1936-37. In early 1940 he went to France as commander of the 1st corps of the British expeditionary force, but was recalled to London on May 26 of that year to become chief of the British general staff. Sir John assumed his new task at a dismal period in British fortunes. The Norwegian expedition had ended in disastrous failure, and the Allied armies were helpless before the mighty German blitzkrieg then rolling through France.

After the fall of France, he started to rebuild the British army, and by the time of his retirement in Dec. 1940 it was again an instrument of military strength. In Dec. 1941 he was appointed governor of Bombay. Subsequently Sir John, who was a field marshal, was named head of the British representation on the combined chiefs of staff (U.S. and Great Britain) in the United States. He died in Washington, D.C., Nov. 4, 1944.

Disasters

The following is a selected list of accidents and disasters for the years 1937-46 inclusive, with the loss of life and property in each. Disasters that resulted from purely military or naval action in World War II will be found by date in Chronology of Events, 1937-46.

Disasters of 1937

Aviation

- 6 Lakehurst, N J. German airship "Hindenburg" destroyed by fire Fiftysix of 97 occupants killed.
- July 28 Near Brussels. Dutch aeroplane struck by lightning. Fifteen occupants killed.
- Aug. 3 Wreckage of Pan-American seaplane discovered by U.S. navy plane 20
- mi. off coast of Colombia. Fourteen passengers missing.

 Aug. 12 Russian aeroplane carrying Sigismund Levanevsky, "the Soviet Lindbergh," and five assistants lost in Arctic after crossing North Pole in effort to pioneer a plane route to the United States for passengers and
- freight. Search by Sir Hubert Wilkins and others unavailing.

 Oct. 17 Chalk Mountain, Wyo. Aeroplane crashed. Nineteen killed.

 Nov. 6 Near Ostend, Belgium. Aeroplane from Cologne to London hit chumney of factory. Eight passengers and three of crew killed, including five members of former ruling family of Hesse.

Fires and Explosions

- Jan. 17 Explosion of sulphuric acid on Canton-Hong Kong train Eighty killed, 50 injured.
- Feb 13 Antung, Manchuria. Theatre fire, 658 bodies recovered.
- Mar 18 New London, Tex. Explosion of natural gas in school. Four hundred
- and thirteen children and 14 teachers killed.

 2 Staffordshire, England. Explosions in coal mine. Thirty killed, many injured

Motor Traffic

- Jan 25 Florida motorbus from Miami to Tampa overturned in canal. Seventeen of 32 occupants drowned.
- Mar. 24 Salem, Ill. Motorbus burst tire. Lighteen killed, five injured.
- Oct. 22 Mason City, Ia. Train struck school bus. Nine killed, 21 injured.

Natural Disasters

- Jan. 22 In Mississippi, Allegheny and Ohio valleys. Disastrous floods began, causing an estimated 900 deaths.
- Jan. 29 Northern Europe. Violent storms. Loss of life exceeded 100. Many ships wrecked.
- May 27 Tialpujahua, Mexico. Cloudburst washed mine tailings onto dwellings. One hundred and sixty-eight reported dead.
 Oct. 28 Dmeir, Syria. Cloudburst overwhelmed many houses. One hundred
- missing.

Railroad

- Mar. 13 Corquoy, France. Express derailed by tree fallen across tracks. Fifteen

- killed, 20 injured.

 July 17 Delhi-Calcutta express derailed. One hundred and seven persons killed.

 July 29 Paris-St. Etienne express wrecked. Thirty killed, 40 injured.

 Sept. 5 Neuss, Germany. Train wreck. Fifteen Catholic pilgrims killed.

 Dec. 10 Castlecary, near Falkirk, Scotland. Railway collision. Thirty-five killed, 63 injured.

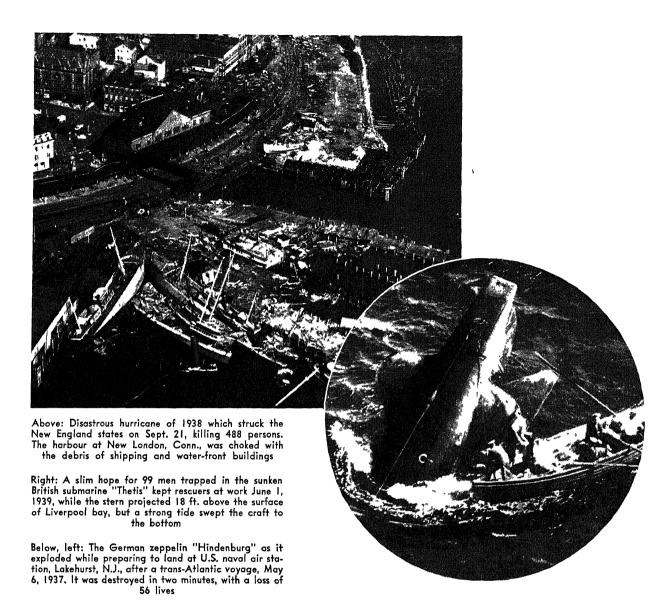

- Sept. 25 Alexandria, Egypt. Twenty-two persons killed and many injured in a crush of crowds to honour King Farouk.
- Oct 25 United States. Distribution of new drug, elixir of sulfanılamide, accompanied by 46 deaths.

Disasters of 1938

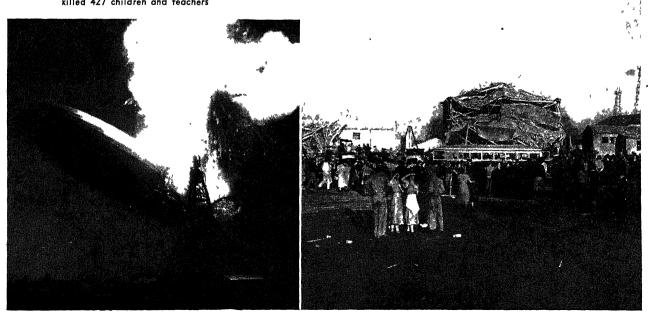

- Jan. 11 American Samoa. Capt. Edwin C. Musick, first pilot of the transpacific clipper planes, and crew of six killed in apparent attempt to make emergency landing in Pacific.
- Feb. 2 San Pedro, Calif. Collision of two U.S. navy bombing planes killed 11 in night practice manoeuvres.
- Mar. 30 Waianae, Oahu Island, Hawaiian Islands. Crashes of two U.S. navy bombers on scouting duty in war practice manoeuvres killed 11.

 April 30 Italy. Nineteen killed in crash of Italian plane of the Ala Littoria line on
- Mt. Maranola in fog. Nearly \$1,000,000 in jewellery was destroyed in flames.
- May 24 Cleveland, O. United Air Lines passenger plane crashed apparently because of simultaneous failure of both motors, killing ten passengers
- July 14 Rome. Italian air liner "I-Volo" plunged into sea off Sardinia. Twenty killed.
- July 24 Bogotá, Colombia. Fifty-three killed, many injured, when stunting military aeroplane fell into grandstand during military review.

 July 29 Pacific ocean, east of Samar Island. Hawaii clipper on flight from Guam
- disappeared with six passengers and nine crew members. Navy search abandoned Aug. 5.

Below, right: Ruins of the New London, Tex., public school, where a gas explosion on March 18, 1937, killed 427 children and teachers

Aug. 10 Near Debrecen, Hungary. Hungarian passenger plane fell after leaving aviation show; 12 killed.

Aug. 13 Kehl, Germany. Czech passenger plane hit mountain top in fog and exploded; 16 killed.

Aug. 18 Varese, Italy. Italian seaplane crashed while taking off; 14 killed.

Aug. 24 Tokyo, Japan. Fifty-eight killed and more than 100 injured when two planes collided and set fire to iron foundry.
 Oct. 1 Near Spluegen pass, Switzerland. German air liner with ten passengers

Oct. 10 Near Soest, Germany. Belgian air liner crashed and burned; 20 killed.

Nov. 4 St. Helier, Jersey, England. Crash of passenger air liner killed 14.

Nov. 26 Near Bathurst, Gambia, Africa. Crash of German transport plane on

experimental flight killed 11.

Nov. 29 Off Point Reyes, Calif. Lost transport liner landed in sea and was beached on rocks; five of seven passengers drowned.

Fires and Explosions

April 23 Grundy, Va. Explosion in Keen mountain coal mine killed 54.

May 16 Atlanta, Ga. Thirty-four lost lives in fire which destroyed Terminal hotel.

Oct. 28 Marseilles, France. Fire in hotel and store during Radical Socialist congress killed 73.

Nov. 6 Oslo, Norway. Fire in studio of court photographer killed 29.

Nov. 12–16 Chang-sha, China. Fire razed city, killed 2,000.

Nov. 18 Hospitalet, Spain. Explosion and fire in Loyalist munitions factory killed approximately 400.

Feb. 13 Sydney, Australia. Nineteen were drowned when a ferryboat carrying 150 capsized.

Motor Traffic

1 Near Salt Lake City, Utah. Twenty-three children and driver of school bus killed in collision with train.

Feb. 18 Rodessa, La. Twenty-five killed in tornado. Mar. 2 Los Angeles, Calif. Floods and landslides in Los Angeles and 100 other communities in five southern California counties caused deaths of 95, and approximately 100 reported missing. Number of homeless estimated at 20,000 and property damage at \$60,000,000.

Mar. 15 U.S. Middle West. Twenty-two killed in tornadoes in Illinois, Missouri, Iowa, Alabama, Georgia, Tennessee and Arkansas.

Mar. 30 U.S. Middle West. A tornado which swept across parts of Arkansas,

Oklahoma, Kansas, Missouri and Illinois killed 36.

April 7 Alabama-Georgia. Tornado and floods caused deaths of 27.

April 20-21 Turkey. More than 300 killed and 50,000 made homeless by earthquakes in central Anatolia in an area reaching from the Black sea almost to the Mediterranean.

June 18 Honan province. Chinese refugees from Yellow river flood estimated by Japanese at 700,000.

6 Kobe, Japan. More than 871 drowned or missing in floods

July 20 Kweichow province, China. More than 2,000 dead and injured after several days of floods.

Sept. 1 Tokyo and vicinity. Heaviest typhoon in Japan since 1905 killed at least 175.

Sept. 21 Northeastern U.S.A. Hurricane followed by floods and tidal waves killed 488 in Rhode Island, Massachusetts, Connecticut, New York, New Jersey, New Hampshire, Vermont and Quebec. Rhode Island, with more than 300 dead, was hardest hit by the storm, which was the worst in the recorded history of the northeastern states.

Sept. 29 Charleston, S.C. Thirty-one killed, more than 200 injured in tornact.

Oct. 21 Tokyo and Yokohama. Typhoon killed 226, injured 590, and left 35,000 homeless.

Nov. 2 Castries, St. Lucia, British West Indies. More than 200 killed or missing in series of mountain avalanches.

8 Philippine Islands. More than 300 killed in typhoon.

Dec. 17-18 Central Anatolia, Turkey. Undetermined number of persons killed in series of earthquakes.

June 19 Miles City, Mont. Forty-seven killed and approximately 65 injured when bridge over flooded Custer creek collapsed under the "Olympian," de luxe passenger train of Chicago, Milwaukee, St. Paul & Pacific rail-

July 30 Near Balaclava, Jamaica. Fifty-two killed, 70 injured in railway wreck. Sept. 25 Near Barcelona, Spain. Sixty-five killed, 200 injured, in head-on collision of trains.

Dec. 19 Barbacena, Minas Gerais, Brazil. Head-on collision of freight and passenger trains killed approximately 90.

Dec. 21 Near Mexico City, Mexico. More than 40 killed in train wreck.

Dec. 25 Near Kishinev, Rumania. Approximately 100 killed, 350 injured in collision of passenger trains.

Disasters of 1939

Aviation

Feb. 24 Near Nice, France. German plane with 12 nazi army officers aboard

crashed in Alps; all were killed. Mar. 18 Near Alder, Wash. Experimental substratosphere transport liner broke apart during test flight; ten killed, including two members of Dutch aviation mission.

May 8 Guayaquil, Ecuador. Crash of military plane in crowded street set fire to surrounding buildings; at least 25 killed, including pilot.

Aug. 13 Rio de Janeiro, Brazil. Fourteen killed, including Prof. James Harvey Rogers, when "baby clipper" plane plunged into harbour and struck dry dock.

Fires and Explosions

Mar. 1 Hirakata, Japan. Approximately 200 killed, 200 injured in explosion of army arsenal.

May

army arsenai.

Halifax, Nova Scotia. More than 30 died in hotel fire.

Near Tokyo, Japan. Eight factories destroyed by series of explosions; at least 11 killed, 260 injured, 30 missing.

Peñaranda de Bracamonte, Spain. Approximately 100 killed, 1,500 injured in explosion of munitions factory; town was virtually demolished. July 10

July 14 Providence, Ky. Twenty-eight coal miners died in explosion.

Oct. 27 Dunfermline, Scotland. At least 35 miners killed in colliery explosion. Nov. 13 Lagunillas, Venezuela. Town destroyed by oil fire; approximately 200 dead or missing.

Dec. 13 Near Brachto, Rumania. Explosion in cellulose factory killed more than 60.

Marine

Feb. 2 Bungo strait, Japan. Japanese submarine "I-63," with crew of 87 aboard, sank after collision; 6 were rescued.

aboard, sank after collision; 6 were rescued.

Feb. 8 Atlantic ocean, 1,500 miles east of New York. British freighter "Maria de Larrinaga" sank with 37 aboard.

May 23 Off Hampton Beach, N.H., U.S. submarine "Squalus" sank in Atlantic with 59 men aboard; 33, including Lieut. O. F. Naquin, the commander, were rescued May 24 and 25, and brought to surface in rescue bell; 26 were trapped and drowned.

June 1 Liverpool bay, England. British submarine "Thetis" sank with 103 men aboard; four escaped through hatch; rescue attempts failed after protuding stern of submarine sank to bottom before it could be out open

truding stern of submarine sank to bottom before it could be cut open or held fast at surface; 99 dead.

June 15 Cam-ranh bay, French Indo-China. French submarine "Phenix" disappeared after dive, with 71 aboard. No trace of craft, except oil slick

on surface, was found.

Aug. 23 Off Ilhéos, Bahía, Brazil. Coastwise steamer "Itacaré" foundered near

port; at least 30 drowned.

Dec. 12 La Perouse (Soya) strait, Japan. Soviet steamer "Indigirka" wrecked in storm; 700 believed dead; approximately 400 rescued.

Dec. 25 (?) Black sea. Turkish ship "Kilizilirmak" sank in storm with entire crew of 20; Greek steamer "Astrea" lost with crew of 14 aboard.

Motor Traffic

Mar. 29 Near Jackson, Miss. Fourteen died when 11 motorcars plunged into swollen creek through gap in highway caused by washout of bridge.

Natural Disasters

Jan. 24 South central Chile. Earthquake devastated area of approximately 50,000 square miles. Estimated death toll was 30,000, mostly in Concepción and Chillan.

Mar. 25 Near Bareges, France. Avalanches in Pyrenees killed 28; others missing. Apr. 15-16 Texas, Louisiana, Arkansas, Oklahoma. Tornadoes killed at least 40.

5 Northeastern Kentucky, U.S.A. At least 75 drowned, others missing in "flash" floods from swollen mountain streams. July

Northern China. Vast areas under flood waters; approximately 10,000,-000 persons homeless, starved or drowned.

Sept. 22 Vicinity of Smyrna, Turkey. At least 300 killed in earthquake.

Dec. 27 Northern Turkey. Earthquakes devastated wide regions in eastern and

northern Anatolia; casualties estimated at more than 100,000 killed or injured; city of Erzingan completely destroyed, with more than 15,000 deaths; floods later increased toll of dead.

Railroad

Feb. 11 Near Barcelona, Spain. Runaway express crashed into local train; 35 killed, more than 100 injured.
 April 13 Near Queretaro, Mex. Train wreck killed 28 outright; others died

April 18 Near Question, New Annumer and April 18 Near Elko, Nev. Streamliner "City of San Francisco" wrecked after passing over rail that had been bent in and spiked down; 24 killed, 113 injured.

Oct. 8 Berlin, Germany. Twenty-two killed in collision of trains.

Nov. 13 Near Oppeln, Germany. Train wreck killed 43, injured 60.

Dec. 22 Near Magdeburg, Germany. At least 132 killed, 109 injured, in collision of two express trains; 99 killed, 40 injured in another wreck near Friedrichshafen.

Dec. 30 Near Naples, Italy. Frozen switch caused train wreck in which at least 29 were killed, 100 injured.

Disasters of 1940

Feb. 27 Near Bucaramanga, Colombia. Eleven were killed when a passenger plane crashed into a mountain.

Mar. 17 Stromboli island, Italy. Fourteen were killed when the Italian air liner "I-Sutro" crashed against a volcano.

June 17 Bellerose, N.Y. Eleven army officers and men were killed when two bombing planes collided.

Aug. 23 Near Mt. Gaina, Transylvania. A passenger plane on the way from

Bucharest to Vienna crashed, killing the 12 passengers and the crew of three.

Near Lovettsville, Va. A plane of the Pennsylvania air lines crashed, Aug. 31 killing 21 passengers, including Sen. Ernest Lundeen of Minnesota and the crew of four.

Nov. 4 Near Salt Lake City, Utah. Ten persons were killed when a plane crashed into the side of Bountiful peak in the Wasatch mountains.

Nov. 8 Rio de Janeiro. Nineteen persons were killed when a passenger plane

collided with another plane and fell into Botafogo bay.

4 Chicago, Ill. A passenger plane crashed after striking a high tension wire at the edge of the airport. Six persons were killed outright; four

Fires and Explosions

- Jan. 10 Bartley, W.Va. Ninety-one workmen trapped underground killed in an explosion in a coal mine.
- Feb. 29 Arsa, Italy. Eighty-six were killed and 100 injured by an explosion in a coal mine.
- Mar. 16 St. Clairsville, O. Seventy-five persons were killed by an explosion in the Willow Grove coal mine.
- April 23 Natchez, Miss. One hundred and ninety-eight persons were burned to
- death in a fire which destroyed a Negro dance hall.

 May 7 Sandona, Colombia. One hundred and three persons, 67 of whom were children, were killed and 125 injured in a fire which destroyed the municipal palace.
- July 15 Sonman, Pa. Sixty-three persons were killed by an explosion in coal mine.
- Aug. 29 Bologna, Italy. Thirty-eight workmen were killed and 174 injured by an explosion in a munitions plant.
- Sept. 12 Kenvil, N.J. Forty-nine persons were killed, about 200 injured and a large number of houses in the surrounding country were wrecked by
- explosion in powder plant.

 Sept. 22 Sogamoso, Colombia. Twenty children were killed and four seriously injured in a panic caused by an alarm of fire in a motion picture theatre.
- Nov. 29 Cadiz, Ohio. An explosion in a coal mine trapped 30 miners who died
- before they could be rescued.

 Dec. 14 Rumania. Fifty-one men®were killed and 250 more trapped by an explosion in a coal mine 150 mi. northeast of Bucharest.

Marine

- Jan. 21 Near Toulon, France. Explosion in engine room of the Italian passenger ship "Orazio" in the Mediterranean set fire to the vessel, resulting in the death of 50 passengers and 60 of the crew.
- Feb. 18 Corunna, Spain. Twenty-two seamen were drowned when the Spanish steamer "Banderas" sank off shore.
- Feb. 25 Vigo, Spain. Thirty persons were drowned by the sinking of a small boat in Marin inlet.
- Mar. 4 Ningpo, China. Two hundred and fifty persons were drowned when the ship "King Shing" capsized in the Yung river.
- 2 Near Straits of Magellan. Chilean passenger steamer "Moraleda" struck a rock and was wrecked with a loss of 76.
- Oct. 13 Black sea. A small sailing vessel capsized near Gorele; 33 were drowned.
- Oct. 25 Sweden. At least 44 persons were drowned when a barge, carrying 80
- soldiers engaged in manoeuvres, capsized on Lake Armasjaervi.

 Nov. 10 St. John's, Newfoundland. Twenty-eight persons were drowned when a ferryboat struck a small motorboat in Conception bay and sank.
- Nov. 20 Melbourne, Australia. Twenty-four naval reservists were drowned when a merchant ship collided with and sank the minesweeper in which
- they were sailing across Port Phillip bay.

 Nov. 25 Haifa, Palestine. An explosion wrecked the steamer "Patria" on which 1,771 Jewish refugees were awaiting transfer to a British colony, killing 22 and seriously injuring 25.
- Istanbul, Turkey. More than 200 Jewish refugees from Bulgaria were drowned in the Sea of Marmora when their ship was wrecked.

Motor Traffic

- Jan. 29 Mexico. Thirty-two passengers killed and 23 injured when the gasoline tank exploded on a bus running from San Bartolo to Otolotepec.
- Mar. 14 McAllen, Tex. Twenty-seven were killed and 15 injured when a passenger train collided with a truck loaded with fruit pickers.

Natural Disasters

- 2 Kemal Pasha, Turkey. Five thousand drowned and 1,000 rendered homeless by a flood which swept over the region.
- Jan. 18 Balcittoy, Turkey. Fifty persons killed, 160 injured and 200 houses wrecked by earthquake.

 Feb. 21 Turkey. One hundred and twenty-five were killed and hundreds in-
- jured by an earthquake which wrecked Soysalli and three other villages in Kayseri province.
- Earthquake which struck Callao, Lima, Chorrillos and other cities killed approximately 350, injured 1,500 and caused widespread damage
- July 12 Seoul, Korea. Fifty-two persons were killed, 100 injured and thousands made homeless by typhoon.
- July 25 Chile. Storms in the northern provinces caused approximately 100 deaths.
- July 30 Anatolia, Turkey. More than 1,000 persons were killed by an earthquake.
- Oct. 18 Barcelona and Gerona, Spain. One hundred and eighty-two persons were drowned by floods in these provinces.
- Oct. 20 France. Floods in the southwest caused the death of 100 persons.
- Nov. 10 Rumania. Four hundred persons were killed and 800 injured by an earthquake which centred in Focsani.

- fire and crashed in jungle, killing all 25 persons aboard.
- Near Stephenville, Newfoundland. All 39 men, women and children aboard U.S. transatlantic air liner were killed when craft exploded after Oct. 3 crashing into hill; cause of accident was ascribed to "mechanical failure."
- Penang, British Malaya. Twenty-one persons aboard Ceylon-to-Singaore transport were killed in crash.
- Nov. 1 Near Limoges, France. Twenty-four persons killed when chartered plane crashed on Paris-Casablanca run.
- Nov. 13 Near Perote, Mex. At least 16 persons were killed in crash of passenger air liner on mountain.
- Nov. 14 Near Amsterdam, Holland. Twenty-six persons killed in air liner crash.
- Nov. 16 Near Iwo Island. Twenty-three persons killed when U.S. army trans-
- port crashed into sea 15 mi. from Iwo.

 Nov. 26 Near San Jose, Costa Rica. At least 23 killed when commercial air liner hit mountainside.
- Dec. 23 Near Rio de Janeiro. Twenty persons were killed in crash of commer-
- cial air liner. Dec. 24 Laguna Mts., Calif. Commercial air liner crashed on peak, killing 12
- persons.

 Dec. 25 Near Shanghai. At least 71 persons were killed when three Chinese air liners crashed separately in heavy fog.
- Dec. 28 Near Shannon, Ireland. Twelve persons aboard commercial air liner were killed when craft crashed and exploded on island in River Fergus near Shannon airport. Eleven survivors of accident were injured.

Fires and Explosions

- Chicago, Ill. At least 61 persons perished in flames or were suffocated June 5 by smoke in fire that swept La Salle hotel.
- Dubuque, Ia. Fire that started in basement of Canfield hotel brought Tune 9 death to estimated 15 people; 22 others were reported as missing.
- June 21 Dallas, Tex. At least 8 persons were killed and 41 others injured when exploding ammonia fumes from air-conditioning unit in basement swept through 700-room Baker hotel. There was no fire.
- June 25 Staten Island, N.Y. Estimated \$2,000,000 damage was caused by fire that destroyed ferry terminal; at least two persons were killed and several others injured in flames.
- Atlanta, Ga. At least 120 persons were killed in fire that swept Winecoff Dec. 7 hotel; an estimated 100 more were injured.
- Saskatoon, Saskatchewan. Fire that started in hotel's restaurant raged through Barry hotel in matter of seconds, bringing death to at least 11 ersons: 18 others were injured.
- Dec. 12 New York city. Collapse of ice plant wall sheared off half of neighbouring tenement, entombing and killing at least 37 residents of build-

Marine

- Feb. 4 Near Seward, Alaska. Passenger liner "Yukon" with 495 persons aboard, split into two sections after running aground in blizzard; coast guard reports indicated two dead and 31 missing.
- July 31 Off Rio de Janeiro. About 27 persons died in fire that started in boiler room of Brazilian transport "Duque de Caxias."
- Aug. 2 Tanganyika, Africa. 295 persons were drowned in sinking of steamer 'Vitya" in Lake Nyassa.
- Sept. 13 Off Cape Hatteras. Captain, his wife and 10 crew members drowned when Norwegian tanker broke in two during hurricane; 24 others of crew were rescued.
- Off Toulon, France. Hope abandoned for 18 men trapped in submarine believed sunk by floating mine off Toulon.

Motor Traffic

Dec. 18 Near Newberry, S C. Ten school children and bus driver were killed when school bus crashed into train.

Natural

- Feb. 13 Constantine, Algeria. At least 276 persons were killed in earthquakes that hit Setif and Batna regions in Constantine department.

 April 1 Alaska-Hawaii area of Pacific ocean. Series of seismic waves started off
- Alaska and Aleutian Islands and spread to Hawaiian Islands, causing about 150 deaths and leaving 5,000 persons homeless in Hawaii alone; damage was estimated in millions of dollars.
- May 28 Susquehanna valley, N.Y.-Pa.-Ohio. Susquehanna river flood, aggravated by heavy rains, caused widespread damage; 12 were reported dead and several persons were reported missing.
- May 31 Mus and Erzurum provinces, Turkey. At least 1,330 persons were killed in earthquake in eastern Turkey that levelled many villages.
- June 17 Detroit-Windsor. At least 14 persons were killed and many others in-jured by tornado that swept through U.S.-Canadian border area striking Detroit and Windsor regions.

Guests of the La Salle hotel in Chicago, III., climbing down fire escapes on the night of June 5, 1946, when fire took the lives of at least 61 persons

- West Indies. Violent earthquake in northern provinces of Dominican Republic brought death to at least 73 persons; heaviest shock accom-4~10 panied by tidal wave occurred Aug. 4; minor tremors were felt in Puerto Rico, Haiti and Cuba.
- Oct. 9 Off Portugal. Hurricane which swept over Madeira and Azores resulted in death of 27 persons.
- India. Between 300 and 400 persons were killed in earthquakes that Nov. 3 struck Muzaffarpur in Bihar province.

- Nov. 12 Negros Island, Philippines. Two hundred and sixty killed in typhoon, Manila dispatches disclosed.
- Nov. 13 Northern Peru. More than 500 persons were believed killed in series of
- earthquakes over 72 hr. in Andes mountain area; quake started Nov. 10.

 Nov. 15 Colorado. At least 18 persons died in two-week-period snowstorms (Nov. 2–15) that paralyzed communications over vast area in Colorado.
- Dec. 21 Southern Japan. Great earthquake, which started six tidal waves, spread ruin over large area of southern Japan; official figures indicated 1,088 dead, 165 missing, 142 injured and 94,669 persons left homeless.

Railroad

- April 25 Naperville, Ill. At least 47 persons were killed and 100 others injured when second section of express train, travelling at more than 75 m.p.h. crashed into rear of first section which had halted.
- Sept. 26 Near Victorville, Calif. Six persons were killed and 50 others injured in crash of crack passenger train.
- Nov. 12 Near Revigny sur Ornain, France. At least 35 people killed and 80 others injured in train crash.
- Dec. 13 Near Mansfield, O. At least 18 persons, including 14 soldiers were killed in three-way crash of passenger and two freight trains.

Miscellaneous

- Jan. 12 Diamond Harbor, India. Collapse of two temporary jetties on Hooghly river resulted in death of estimated 160 pilgrims who were bound for site of ceremonial bath.
- Mar. 9 Bolton, Lancashire, Eng. At least 33 persons were killed and 500 more were injured when guard rails in football stadium collapsed.

Disciples of Christ

In common with other religious bodies, Disciples of Christ suffered curtailment of some activities and the redirection of others during the years of World War II. Building operations were at a standstill, but many churches accumulated funds for future building. Normal expansion in home missions had to give place to special services to armed service personnel, to new industrial communities, and to displaced Americans of Japanese ancestry. Many of the younger ministers went into the chaplaincy with the armed forces (422 in service at the end of hostilities). The adoption of a resolution by the 1936 convention disapproving the military chaplaincy with "rank, pay and allowances" from the war department, and favouring a civilian chaplaincy supported by the churches to serve the armed forces, did not prevent hearty co-operation in the existing system, since there was no other. Carroll C. Roberts was chief of the Disciples' office for the certification of candidates for the chaplaincy. The supply of candidates for the ministry was temporarily reduced. A special fund, the "emergency million," was raised for wartime services during 1941-43. Restrictions on travel prevented the holding of many scheduled conventions and assemblies, and especially interfered with summer conferences and camps for young people. The annual international convention (U.S. and Canada) was omitted in 1940, 1943 and 1945. The 1946 convention was held at Columbus, Ohio, with M. E. Sadler as president. The world convention was postponed and moved from Toronto, Canada (1940) to Buffalo, N.Y. (1947). Robert M. Hopkins served as president of the United Christian Missionary society during the entire decade. Harry McCormack succeeded him in 1946, when Dr. Hopkins was appointed to serve the World Council of Churches at the Geneva office and to cultivate acquaintance with Disciples in Europe.

Disciples participated in all interchurch and oecumenical movements—the Conference on Life and Work at Oxford and the Conference on Faith and Order at Edinburgh, both in 1937, the continuing American Theological committee, a subsidiary of the latter; the Conference on the World Mission of the Church at Madras, India, in 1938 and the formative processes of the World Council of Churches of Christ. At their 1946 convention they unanimously approved the formation of the National

Council of Churches of Christ in the U.S., a merger of the principal existing interdenominational agencies.

Inner tensions which had long existed among Disciples continued unabated. The movement which gave rise to the Disciples as a separate body (in 1830) began with an appeal for the unity of all Christians and a return to simple and noncredal Christianity by the "restoration" of the primitive faith and practice. There had always been differences of opinion as to what was primitive and how much of it should be restored. The immersion of adult believers became the only recognized baptism, and until about 1900 there was no suggestion that this might be a matter of opinion. Before 1900 there were many who thought instrumental music and missionary societies contrary to the New Testament pattern; these separated and after 1906 were listed by the census as "Churches of Christ." Among those who did not withdraw on those issues were many who regarded it as apostasy not to believe in the infallibility of the Bible, and who thought that the autonomy of the local church was invaded by the actual operations of the missionary and administrative organizations and that the appointment of authorized representatives of the Disciples in the federal council or other interdenominational bodies was a usurpation of power. The protesting element refused to support the work of the United Christian Missionary society, which it charged with excessive "liberalism," and avoided the international convention, to which this and other agencies continued to report. It supported a number of independent missions and, for about ten years prior to 1946, held an annual convention of its own, called the North American. Sessions of the international convention were generally harmonious and its actions substantially unanimous, because those who disapproved its policies did not attend. There was, nevertheless, some overlap in the attendance at the two conventions, both of which were, in effect, mass meetings of all Disciples who wished to attend. In 1945 there were 5,872 churches which contributed to agencies reporting to the international convention, and 2,157 which did not. An acutely controversial point was the practice of "open membership" (the reception of Christians of other denominations into membership without immersion), which was adopted by a considerable and rapidly increasing number of churches.

These inner tensions and divergences of opinion led to the appointment, in 1936, of a commission on re-study of the disciples, on which the various schools of thought were represented. The commission published a report in 1946 defining the issues and mapping the field for further study, with a view to ironing out differences or maintaining unity in spite of them.

Indications of Growth.-In 1936, world membership in the Disciples of Christ was 1,756,403 (U.S. and Canada, 1,612,172; foreign, 144,231). Churches in the U.S. and Canada numbered 8,198, foreign, 825; ministers, U.S. and Canada, 7,304; local church maintenance, \$9,410,460 (in 1931 it was more than \$13,000 000); missions, benevolences and education, \$2,950,228. U.S. churches had foreign missions in Africa (Belgian Congo), China, India, Jamaica. Japan, Mexico, Philippine Islands, Puerto Rico, Argentina and Paraguay, with 205 organized churches having 65,181 members in these lands, served by 173 missionaries and 1,711 nationals. In addition, the British churches maintained missions in South Africa and Siam, and the Australian churches had missions in the New Hebrides. Of countries which were not mission fields, Great Britain reported 15,838 members, Australia 32,396, New Zealand 4,725, Norway 544, Denmark 120, South Africa 411 and

Poland 25,000. A total of 41 countries were listed in which Disciples of Christ had churches. Many of these were countries in which religious movements had been discovered with close kinship with the Disciples in spirit, purpose and program, but which had entirely independent origins and histories and little or no direct connection with Disciples in the English-speaking countries, and had received no aid from them. Of this class, only the Polish "Disciples" entered into the statistics, and these only by an estimate unsupported by details.

Comparable statistics for 1945 (year ending June 30) were as follows: Membership, as in the paragraph above, showing gains of 5.1% for U.S. and Canada, 15.5% for foreign, and 6.3% for the world. Churches, U.S. and Canada, 8,004; foreign, 922. Ministers, U.S. and Canada, 7,854. Local church maintenance, \$20,913,535. Missions, benevolence and education (including war emergency funds and college endowments), \$9,120,208. Wartime conditions had such a disturbing effect on foreign missions in some fields that reports could not be made which were fairly comparable with those for 1936, although only in Japan and in the Philippine Islands were operations suspended entirely. The Yearbook of Disciples of Christ published in Dec. 1945 stated that there were members in "17 foreign countries," including mission fields. "Unified promotion," in which many of the missionary and educational agencies co-operated in a united appeal to the churches for support, completed its tenth year on June 30, 1946. Twenty-five educational institutions co-operating with the board of higher education reported an aggregate of \$18,246,357 in endowment funds, \$37,029,127 in total assets and 9,470 students, of whom 1,016 were students for the ministry. (W. E. GA.)

Displaced Persons

As the events of World War II made increasing demands on German manpower, the nazis engaged in a systematic and ruthless program of recruiting foreign labour to bolster home production for their war machine. Recruitment is hardly the word to apply to the hundreds of thousands of Jews and those considered politically undesirable who were deported to labour and die in nazi concentration camps. But millions were recruited from France, Belgium, the Netherlands, Denmark, Norway, Poland, Soviet Russia, Italy and the Balkan countries through open threats and subtle forms of economic coercion.

With the publication of E. M. Kulischer's book, Population Displacement in Europe, in 1943, the public was given its first opportunity to examine the details of this nazi program of enslavement, although the British foreign office and the U.S. department of state, various independent research workers in demography and the various governments in exile in London had collected valuable information on certain aspects of the program. Unfortunately the various experts did not agree, and estimates of the number of displaced persons in Germany and nazi-occupied Europe varied from a low of 8,000,000 to a high of 30,000,000.

The Anglo-U.S. military authorities in London soon realized the necessity for advance planning to meet the eventuality, with the defeat of Germany, of caring for and repatriating millions of Europeans. Before a plan could be drafted, however, it was necessary to obtain the most accurate knowledge possible of the magnitude of the problem, so that supplies of food, clothing and medicine could be requisitioned to care for these displaced persons from the time of their liberation until they could be

repatriated. These estimates were made during the winter and spring of 1944 through the joint efforts of the Anglo-U.S. intelligence agencies and the governments in exile located in London. The work was initiated and given direction by Supreme Headquarters Allied Expeditionary Force (S.H.A.E.F.). The estimates (as shown in summary form in Table I), gave the number of foreign workers, deportees and other categories of displaced persons by nationality for each country, subdivided by regions, provinces, departments and urban centres and provided the basis for the S.H.A.E.F. plan.

The master plan which was written during the spring of 1944 by Majors M. Macdonald (British) and L. W. Cramer (U.S.) was essentially a product of integrated Anglo-U.S. staff work in the Displaced Persons branch, G-5 division (military government) of S.H.A.E.F. After receiving the approval of the supreme commander, the plan was issued to the S.H.A.E.F. armies as Administrative Memorandum Number 39. In brief this memorandum: (1) defined displaced persons as civilians outside their country by reasons of the war and refugees as temporarily homeless or displaced nationals within their own country; (2) placed full responsibility on military commanders in the field for the care and repatriation of displaced persons, including the requisitioning of supplies, billets and transportation; (3) specified the functions and the establishment of collecting points, transit centres and assembly centres required for the orderly rearward movement of displaced persons during combat; (4) made a fundamental distinction between the care to be given displaced persons of United Nations nationality and that to be provided for axis nationals; (5) defined the responsibilities and duties of Allied repatriation officers; and (6) fixed a system of individual registration and identification, with an instruction book in 19 languages for the control and issuance of repatriation visas for displaced persons.

Table 1.—Estimated Number of Displaced Persons in Germany and Austria, May 1944

Country of Origin	Total
France	2,320,000
U S.S.R	1,840,000
Poland	1,403,000
Belgium	559,000
Netherlands	402,000
Czechoslovakia	350,000
Yugoslavia	328,000
ltaly	195,000
Baltic States	100,000
Hungary	65,000
Denmark	45,000
Germany (in Austria)	40,000
Luxembourg	30,000
Bulgaria	25,000
Rumania	14,000
Greece	12,000
Norway	10,000
Total	7,738,000

In comparing the totals in Table I with those given in Table II, certain comments are appropriate: (1) The governments in exile for the most part deliberately exaggerated the totals for their countries to mislead the nazis in their recruiting program; (2) No estimate was ever furnished by the soviet authorities, probably because they themselves did not know; and (3) these estimates are really only comparable to those given in Table II for western Europeans since it was not known how many Poles, Czechoslovaks, Hungarians and Rumanians were uncovered and repatriated from the areas under soviet control.

Feverish preparations were made to implement the plan while it was still in draft stage. Working arrangements were made with the London governments in exile and

with the soviet embassy for the assignment and training of Allied repatriation officers, and training for the first of several thousand was begun. A training course for upward of 1,000 key Anglo-U.S. military government officers was given at training centres in Manchester and Eastbourne, England. Initial distributions of identification and registration forms and instructions were made. Finder lists and maps showing concentration camps and general housing capacities of cities and towns, mass housing facilities and a variety of related data were prepared and distributed. Supply estimates involving hundreds of thousands of tons were made and included in the overall requisitions. Preparations were completed just prior to D-day in June 1944.

Combat Operations.—The Normandy landings uncovered only a few thousand fortification workers, and even by the fall of 1944 only 50,000 displaced persons had been liberated. The nazis obviously were evacuating these labourers behind their lines for work in war factories within Germany. However, the enormous task of caring for more than 1,000,000 French, Belgian and Netherlands war refugees provided vital training in mass feeding and housing for the officers and men of the Anglo-U.S. armies and resulted in a nucleus of skilled personnel able to cope with the tenfold larger problem ahead in Germany.

The winter and spring months of 1944 saw the beginning of the U.N.R.R.A. program for recruiting assembly centre teams. Administrative difficulties of integrating the international personnel of this civilian agency into the Anglo-U.S. military organization during combat were overcome, and the first U.N.R.R.A. "spearhcad" teams of eight welfare workers each were on their way to assembly centres in the forward areas by the middle of April 1945. Forward areas were cleared of displaced persons in preparation for the Allied spring offensive. Valuable experience was gained in moving some 50,000 displaced persons rearward in trains of straw-lined boxcars.

With the beginning of the final Allied offensive late in Feb. 1945, German commanders no longer continued to evacuate displaced persons rearward, but sought to embarrass the Allied advance by pushing these unfortunate people forward. Thus during March more than 200,000 displaced persons were liberated and this number increased in rapid geometric progression to upward of 6,000,000 persons by the time of the collapse of the German armed forces on May 8, 1945. Conditions were chaotic for a period of two or three months, and it was fortunate that winter had given place to the warm weather of spring and summer. Rapid repatriation of western Europeans kept pace with the Allied advance. Displaced persons by the hundreds of thousands were loaded in empty returning supply trucks and unloaded and reloaded at railheads for train journeys to their homelands. Thousands of aeroplanes, after bringing food, gasoline and munitions to combat troops were similarly loaded with displaced per-

The rapid repatriation of Frenchmen, Netherlanders and Belgians was a saga of World War II. In the three months of April, May and June 1945, some 1,500,000 Frenchmen, 250,000 Netherlanders and 250,000 Belgians and Luxembourgers were repatriated. But the western Europeans were only 40% of the problem. The remaining 60%, eastern and southeastern Europeans, could not be so easily repatriated.

The displaced persons who could not be repatriated immediately were accommodated in some 800 assembly

centres (mass housing units consisting of bombed out barracks, schools and other public buildings), fed almost 100% from German food supplies, dusted by the million with DDT powder, and given essential medical treatment and first aid.

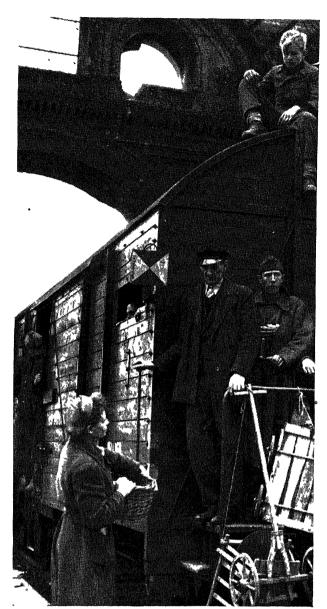

The displaced persecutees found in concentration camps presented by far the greatest problem. More than 300,000 such persecutees were liberated, but the majority of them were required to remain in camps for short periods of quarantine to prevent the spread of typhus, diphtheria, dysentery and tuberculosis. Tens of thousands of advanced cases of starvation required careful treatment. Complete army hospital units were mobilized for service within these camps, and local German civilians and Wehrmacht prisoners of war were requisitioned by the thousands to clean the premises. The rapidity with which this problem was solved, resulted in saving the lives of thousands.

During May 1945 arrangements were quickly made among the British, U.S. and soviet authorities for the repatriation of soviet citizens from the S.H.A.E.F. area, and western Europeans and former prisoners of war from the soviet area. Rail, air and truck transport was used to the fullest extent possible, and by the end of August 2,000,000 soviet citizens had been returned and 454,000 western Europeans repatriated. Arrangements were made in June between S.H.A.E.F. and the Mediterranean Allied command (A.F.H Q.) in Italy for a two-way movement via the Brenner pass and through Switzerland of Italians from Germany, Austria and France, and of German prisoners of war, German civilians and a few thousand western and eastern Europeans from Italy. By the middle of September 580,000 Italians had been repatriated. Concurrent with the movement of soviet citizens and Italians, 135,000 Czechs were repatriated via Pilsen from the west and through Budweis from Austria; 200,000 Yugoslavs were repatriated across the Austrian border just north of Jesenice; and 12,000 Greeks were returned to Athens by air or overland via the Brenner pass, Italy and small coasting vessels to ports of the homeland. By the end of the summer all remaining French, Belgians, Netherlanders, Danes and Norwegians desiring repatriation had been returned, and a start had been made on repatriating Poles, Germans from Austria, Rumanians and Hungarians. The period of mass repatriation was over. Five million displaced persons had been repatriated, but more than 1,000,000 remained as a care and welfare problem for the winter months.

Static Period, Winter of 1945-46.—At the beginning of Oct. 1945 the Anglo-U.S. program for displaced persons stood as indicated in Table II. Polish nationals, numbering

Displaced persons crowded into all available travel space, inside and outside of trains leaving Berlin in 1945. The city was swollen with DP's in transit

837,000 persons, represented the major problem, and only 25% of these were unwilling to be repatriated. Balts, Yugoslavs and ex-enemy Hungarian and Rumanian nationals comprised the majority of the remainder.

The repatriation of Poles was delayed by unwillingness on the part of the soviet authorities to allow repatriation across their area of Germany during September and October, while they satisfied themselves that all soviet citizens had been returned from western Germany and Austria. Actually, the movement of soviet nationals had dwindled to a small trickle during these two months. The few movements of Poles were made by way of Pilsen and Praha to the Katowice area, through the co-operation of the Czechoslovak government. As for the Hungarians and Rumanians, in this case with full soviet co-operation, their repatriation was quickly completed before the end of Nov. 1945.

Thus, with the onset of winter the Poles, the Balts, the White Russians, the claimed but not accepted Yugoslavs and Czechs, and some 20,000-30,000 Jews and other

Germans who had been inmates of nazi concentration camps remained as a joint responsibility of the Anglo-U.S. armies and some 5,000 U.N.R.R.A. assembly centre workers.

Well before the beginning of cold weather, late in 1945, extensive programs of assembly centre improvement and winterization had been undertaken. Buildings and heating plants were repaired and wood fuel collected; adequate distributions of army and U.N.R.R.A. supplies of winter clothing, shoes, blankets and hundreds of other items were made; extensive welfare programs, calculated to make the displaced persons contented with their lot, were undertaken; rations were increased from a minimum of 2,000 calories per person per day to 2,300 calories for all United Nations displaced persons. Jews and other persecutees were alloted 2,500 calories. Insofar as possible, each assembly centre was operated under committees of residents elected by democratic means. But notwithstanding these improvements, the necessity for mass care (which was the only way such large numbers could be maintained in isolation from the hated German civilian), resulted in drab over-crowded living quarters, dull tasting food, and isolation and uncertainty about the future in a state of enforced idleness. Unhappiness and discontent became the rule rather than the exception.

Situation in Fall of 1946.—By Sept. 1946 substantial progress had been made in solving the displaced persons problem in the British, U.S. and French zones of Germany, with 885,000 persons repatriated (compare Tables II and III). The condition of displaced persons was materially improved. Assembly centres were consolidated into the best facilities available and made comfortable for winter occupancy. Recreational, educational, religious and employment programs relieved the monotony. Displaced persons received abundant rations, averaging from 2,000 to 3,000 calories per person per day. Hundreds of tons of amenity supplies were distributed. Thus, displaced persons enjoyed a higher living standard than did the nationals of most European countries, and one markedly superior to that of the German civilian, who subsisted on 1,000 to 1,500 calories. Notwithstanding abundant rations and remedial efforts by U.N.R.R.A., displaced persons for the most part were discontented. Unrest developed, marked by a disproportionate amount of crime, ranging from black market operations to acts of extreme violence. Efforts continued to persuade displaced persons to volunteer for repatriation, and to eliminate unqualified persons, but 370,-000 Poles remained who did not desire repatriation, 56,000 additional Balts were admitted to assembly centres, and 95,000 Jews infiltrated from Poland and Hungary.

U.N.R.R.A. extended the scope and efficiency of its operations and signed agreements with the British, U.S. and French authorities permitting operations as a quasi-independent organization responsible for management of assembly centres, distribution of amenity supplies, supervision of voluntary relief agencies and operation of a central tracing bureau. The military agreed to furnish basic supplies of food, clothing and medicines, buildings and other assembly centre facilities, police protection and supervision of some 500 Allied repatriation officers. It also agreed to negotiate transfer points, routes and modes of travel and other considerations of repatriation movements.

Assembly centres were operated by U.N.R.R.A. on a democratic self-help basis. Residents were formed into committees dealing with all aspects of life in each centre. U.N.R.R.A. and its affiliated agencies assembled qualified

*Included in others and unclassified.
†Of these totals, aggregating 789,000 displaced persons, 348,000 were in the British, 404,000 in the U.S. and 37,000 in the French zones.
‡Based on official government sources. Whereas these totals undoubtedly represent, for the most part, repatriates from Germany and from the soviet zones, yet they are known to include some repatriates from the United Kingdom, Sweden, Switzerland and other traceruisid areas. other unoccupied areas.

welfare workers, warehouse managers, teachers, doctors and nurses who relieved the military of a great burden, kept unrest to a minimum, and made lasting contributions in rehabilitating millions of displaced persons.

Repatriation was slow, but the 850,000 persons repatriated required difficult individual persuasion, complex transit negotiations, and the overcoming of problems of winter movement. Polish repatriation had begun in the autumn of 1945 with train movements through Czechoslovakia to the Katowice area, truck movements from Lueneburg to Stettin on the Oder, and ship movements on the Baltic from Luebeck to Gdynia. By the end of Dec. 1945, 300,000 Poles had been repatriated. Then bitter winter weather and unfavourable reports from Poland resulted in slowed and intermittent repatriation, so that by Sept. 1946 only 200,000 additional Poles were repatriated. Hungarian repatriation started slowly in Dec. 1945 after protracted negotiations with the soviet authorities who required the screening out of suspected collaborators, volksdeutsche, and former soldiers in the German army. Intermittent train movements commenced via Linz and Heygesholm and continued until the summer of 1946. Hundreds and even thousands of a score or more of other nationalities continued to be repatriated. Delay resulted from personal fear of political consequences, profitable employment in Germany, illness requiring hospitalization, family ties with German civilians, anticipated future business opportunities and a variety of transport difficulties.

At the close of hostilities, approximately 25,000 Jewish displaced persons, all former concentration camp inmates and persecutees, were uncovered. Special Jewish centres were established. Increased rations and special care administered by Jewish voluntary relief agencies quickly restored this Jewish group to tolerably good health. Persistent reports of anti-Semitism in Poland coincided with the arrival of a few hundred Polish Jews at U.S. centres in Bavaria. Interrogations of many of these new arrivals revealed that they had been guided to Bavaria by their kin who had returned to Poland for that purpose. These initial infiltrations swelled in numbers so that by the summer of 1946, 90,000 Polish and some Hungarian Jews had arrived, almost exclusively in the U.S. zone. Strenuous efforts to block infiltration succeeded for the British and French but continued steadily in reduced numbers into the U.S.

zone. Whether or not this infiltration was a well-organized movement assisted by outside funds to force action on the Palestine question was beside the point. The fact was that these people had arrived and desired access to Palestine or to the U.S.; their presence was an expensive burden. Dodecanese

The Dodecanese is a group of 12 formerly Turkish islands in the southeastern part of the Aegean sea. The most important of the islands is Rhodes; other large islands are Cos, Kalymnos and Leros. Area 1,035 sq.mi., pop. (April 21, 1936) 140,848. Capital Rhodes (pop. 27,466). Of the total population in 1936 the Greeks formed 85%.

The islands were Turkish for several centuries before they were occupied by Italy in the course of its war against Turkey in 1912. They were officially ceded to Italy by Turkey in the treaty of Lausanne which came into effect in 1924. This cession included also the small island of Castelrosso with its strategic position on the Anatolian coast. Following the defeat of Italy in World War II, Greece demanded the cession of the islands in view of the large majority of Greek inhabitants and also Italy's wanton act of aggression against Greece in Oct. 1940. The Greek demand was supported by the United States and Great Britain. The U.S.S.R. was reported to have objected to the outright transfer of the strategic islands to Greece and to have demanded either a trusteeship over the islands or at least a cession of naval and air bases there. At the meeting of the foreign ministers of the four big powers in Paris on June 27, 1946, however, it was unanimously decided to give the Dodecanese Islands to Greece and to demand their complete demilitarization. (See also Italian COLONIAL EMPIRE.) (H. Ko.)

Doenitz (1892—), German naval officer, was born Sept. 16, 1892, in Berlin. Commissioned an ensign in the Imperial German navy in 1913, he served in a submarine division during World War I. Taken prisoner by the British in 1918, he was repatriated in 1919. On his return to Germany, he rejoined the German navy. (The prosecution at the Nuernberg war crimes trial in 1945 charged that Doenitz assisted in construction of hidden U-boats in violation of the Versailles treaty and in training crews to man them.) He was chief of the U-boat force, 1939—43, becoming grand admiral and commander in chief of the German navy in 1943.

On May 1, 1945, Doenitz announced the death of Adolf Hitler and declared himself successor to the fuehrer, at the latter's express designation. Doenitz conceded in a broadcast on May 5 that resistance against the western Allies had become "senseless," and ordered his envoys to sign Allied surrender terms on May 7 at Reims, France. On May 23, the Allies dissolved his government and arrested him. He was one of the principal defendants at the Nuernberg trials that started Nov. 20, 1945. The court's ruling of Oct. 1, 1946, exculpated Doenitz of charges that he was a party to the nazi conspiracy to wage aggressive war, but convicted him on two counts: that he did commit crimes against the peace and that he violated customs of war. He was sentenced to 10 years of imprisonment.

Dog Racing

The pari mutuel betting lure stimulated dog racing considerably in the United States during the decade 1937–46, with 1946 marking a new high in attendance, value of purses and wagering. Two states, Massachusetts and Florida, were the meccas of the sport, with lesser racing at Phoenix, Ariz., and Portland, Ore. Winter racing was centred at Florida's 11 tracks, while the summer concentration was in Wonderland, Massoit and Taunton, all near Boston, Mass.

A review of the 12-year history of Wonderland, largest of the dog tracks in the United States, served to prove the growth of greyhound racing. When the track opened in 1935, 4,500 people attended the inaugural and bet \$48,000. In 1946, opening night drew 23,000 people who bet

Start of the open stake event in the annual field trials at Pinehurst, N.C., in Jan. 1945. Ricochet Guy (left) finished in second place \$600,000. Thereafter, throughout 1946, Wonderland nightly averaged 18,000 in attendance and \$500,000 in pari mutuel handle for the 100-night meeting.

Breeding of greyhounds also increased during the ten years, perhaps twofold. It was estimated that there were 100,000 greyhounds in breeding each year. In 1945, a record \$30,000 was offered Ray E. Holmes of Revere, Mass., for his two-year-old sensation, Lucky Pilot, but was relused. In England, where dog racing was run on a larger scale than in the United States, the record sales price up to 1945 was \$10,000 for Magic Bohemian, a greyhound which attracted attention by winning a 525-yd. race in 29.1 sec.

Purse money increased apace of interest in the sport, and in 1946 \$10,000 was distributed in the American Challenge Cup series. In 1945, a record payoff of \$2,850 was made for a daily double winner at a Miami track.

Like horse racing, the greyhound sport suffered when war conditions forced a half-year ban on animal racing in the United States during 1944. That year also brought dog racing one of its biggest tragedies, when a kennel fire at Phoenix destroyed 60 greyhounds.

Three outstanding runners marked the progress of dog racing in the United States during the decade. Foremost was Rural Rube, regarded as the "Man o' War" of the greyhounds. Next in 1941, came Never Roll, which set four world records and tied another. Into prominence in 1946 came Lucky Pilot, son of Never Roll, which in his first dozen starts as a 2-year-old broke one and tied two of his sire's world records. (M. P. W.)

Dominican Republic

A West Indian republic, sometimes (but incorrectly) referred to as Santo Domingo, the Dominican Republic occupies the eastern two-thirds of the island of Haiti or Hispaniola. Area, 19.325 sq.mi.; pop. (July 1945 est.),

2,029,054. The population by the 1935 census was 1,479,417; later official estimates of population were: 1939, 1,656,219; 1944, 1,969,773. Almost two-thirds of the population lives in the Cibao lowlands in the north; most of the rest live in the vicinity of Ciudad Trujillo on the south coast. Racial distribution is estimated to be 15% white, 15% Negro and 70% mestizo. The population is predominantly rural and agrarian; only about 15% live in cities. The birth rate in 1941 and the death rate in 1940, both based on incomplete data, were respectively 31.4 and 9.3 per 1,000. The capital is Ciudad Trujillo (formerly Santo Domingo) with a pop. (1946 official est.) of 131,271 (1935 census 71,091). Other cities (with 1945 pop. estimates) are Santiago de los Caballeros (54,113), San Pedro de Macorís (22,728), San Felipe de Puerto Plata (15,610).

The executive branch is headed by a president elected directly for a five-year term and eligible to immediate reelection; the legislative branch is a bicameral congress including a senate of 19 members and a chamber of deputies of 40, members of both houses being elected directly for five-year terms; the judiciary is headed by a supreme court of justice. Presidents during the decade 1937–46: Generalissimo Rafael Leónidas Trujillo y Molina, 1930–Aug. 16, 1938; Dr. Jacinto B. Peynado, Aug. 16, 1938–March 7, 1940; Dr. Manuel de Jesús Troncoso de la Concha, March 7, 1940–Aug. 16, 1942; Gen. Trujillo, after the latter date.

* * *

THE PRINCIPAL development of 1937 was the Dominican massacre of Haitians near the common border of the two republics. A long-standing boundary dispute between the two had been settled in Feb. 1935, but feelings, especially along the border zone, continued strained, particularly because of the casual and irregular migration of Haitian peasant farmers across the boundary for work on the Dominican side. Haiti's population density being much greater (about 300 per sq.mi.), this helped relieve the population pressure but caused almost chronic ill will. The climax came in large-scale disorders, beginning in Oct. 1937, which resulted in the killing of large numbers of Haitians, some estimates running above 7,000. The attacks were allegedly condoned by the Dominican government with the result that considerable hostility, popular and official, was directed from abroad toward the administration of Pres. Trujillo. The Haitian government requested an international investigation, but this was opposed by Trujillo. The matter was resolved by the Permanent Committee of Inter-American Conciliation on Jan. 31, 1938, with the Dominican government agreeing to pay Haiti an indemnity of \$750,000.

Pres. Trujillo decided not to continue in office beyond 1938, and the candidate of the Dominican party (the only party legally permitted in the republic) in the election held in May 1938 was Dr. Jacinto B. Peynado, a political lieutenant of Trujillo. Peynado was elected without opposition and was inaugurated on Aug. 16.

Favourable international attention was attracted early in 1939 by proposals made for the colonization of up to 100,000 Jewish and other refugees from central Europe in the Dominican Republic. The project was an outgrowth of the Evian refugee conference in 1938. Gen. Trujillo contributed a 26,000-ac. estate in the northern part of the republic as a nucleus, to which later additions were made. A commission appointed by the Inter-Governmental Committee on Refugees began in March 1939 a study of the

feasibility of such large-scale colonization.

Pres. Peynado died March 7, 1940, and was succeeded by Vice-Pres. Manuel de Jesús Troncoso de la Concha, a lawyer by profession and a former rector of the University of Santo Domingo. The change had little practical significance, however, because Gen. Trujillo retained strong political control of the island republic. Plans for the resettlement of European refugees continued. The vanguard of the Sosúa colony reached the country in May and began development of the estate given by Trujillo. By the end of 1940, some 500 settlers, mostly German Jews, were at Sosúa. Trujillo in 1941 gave 50,000 ac. of land to the colonists. Various agencies in the United States, including the Brookings institution, extended technical aid by lending experts in such fields as rural electrification, sanitation, and tropical forestry. In commemoration of Trujillo's part in establishing the Sosúa colony, the Foundation for the Redemption of Israel, with headquarters at Jerusalem, gave him an illustrated album and diploma in 1946. Charges were made in Aug. 1940 that the Dominican-German Scientific institute, founded in 1937, was engaged in fifth-column activity. The economic impact of the war was hitting the republic hard by 1940 and continued to do so in later years; the cost-of-living index by the end of 1943 had reached 190 as against 100 in 1939.

The Dominican government concluded a highly important treaty with the United States early in 1941 abrogating the right of the latter government to supervise the collection of Dominican customs, a galling concession in effect since the modus vivendi of Feb. 1905. The Dominican government on April 1 formally took over the collection of customs. The government gave further evidence of cordial relations with the United States by declaring war against all major axis governments in Dec. 1941 within a few days after the attack on Pearl Harbor. Other signs of close co-operation with the United States included the authorization, in March, of a \$300,000 loan by the United States Export-Import bank to supplement a \$3,000,-000 credit of Dec. 1940. With technical assistance from the United States, the Dominican government continued its efforts in 1941 to establish a rubber industry in the republic.

The outstanding political event of 1942 was the return to office of Gen. Trujillo. The election was held in May; Trujillo, unopposed as the candidate of the Dominican party, was elected to a new five-year term. This was the first national election in which women were allowed to vote, changes in the electoral system having been introduced by constitutional amendments in 1942. One woman senator was elected and three other women were chosen deputies. Dominican economy was increasingly seriously affected by the disruption of shipping facilities caused by World War II. During the year, the government took over all stocks of automobiles, both new and used, as well as all supplies of rubber; it also instituted both gasoline rationing and traffic control. Shortages in food supplies resulted in the formation of national commissions to set price ceilings, encourage rice production and regulate trade. The government early in May prohibited the export of livestock, meat, eggs and some other foodstuffs.

The Dominican government took action early in 1942 to prevent subversive activity within its boundaries; the attitude was of especial importance because the strategic location of the island made it significant in hemisphere defense. Axis minority groups were not large (estimated at 140 Germans plus 100 nationals of German descent and 350 Italians plus 400 nationals of Italian descent), but the government took over property owned by alien enemies

Refugee camp for persons made homeless by a series of violent earthquakes which shook the Dominican Republic in Aug. 1946, levelling four towns, killing several scores of persons and leaving a wave of epidemics in its wake

and forbade axis nationals to acquire motor vehicles. All boats in national waters were placed under government jurisdiction, and regular inspections of the coast were instituted to prevent the axis from establishing secret bases on Dominican territory for supply of submarines in the Caribbean. Emphasis was given to the need for control of the movement of United States currency when a Spanish shipmaster was reportedly seized during the year with \$220,000 of "hot" money in his possession. The government in July enacted the necessary legislation to prevent the export and import of such currency. The acute passenger transit problem was somewhat relieved during the year by the granting of a new contract to British West Indian Airways and by other expansion in air communication.

Shipping operations improved in 1943 as the submarine menace abated, but shortages of consumption products continued, especially in such items as gasoline, iron and steel products and electrical appliances. Truck operation was reported as reduced by 60% and horse-drawn vehicles were used wherever available. The government set up control commissions for several commodities such as textiles and nails, but in spite of price-fixing legislation the cost of living steadily increased. An agricultural diversification program, started in the early 1930s, resulted in basic food conditions that were much better than in some other

Caribbean states. Some foodstuffs (rice, for example) were available for export, although a few years earlier they had been imported in substantial amounts. Unemployment was not a serious problem, although it had been at times earlier. An important labour law passed during the year established procedures designed to expedite recognition of labour federations, associations and unions. The administration established official censorship of all means of communication on April 16. Both the United States and the Peruvian legations were raised to the status of embassies during 1943, with the Dominican government reciprocating.

In Jan. and Feb. 1944, the republic celebrated, with elaborate ceremonies, the centennial of its independence from Haiti; the celebration ended Feb. 27. The year was otherwise a quiet one both in internal and foreign affairs. The 1945 and 1946 sugar crops were placed under contract at the end of May with the British Food administration, at a price per pound to be fixed subsequently but guaranteed not to be less than that eventually set for the Cuban crop. The 1943-44 crop, a record one of more than 600,000 short tons, was under contract for sale to the United States, which had also arranged, in Dec. 1943, to take the entire Dominican molasses output for the year 1944. The United States likewise agreed to purchase surplus peanuts, beans, cattle, corn and rice, and was given an option to buy butter, eggs, fresh vegetables and fruit. The government announced a program of agricultural education during 1944. The congress passed a labour contract law and May 1 was established as a labour holiday. The inflationary trend characteristic of the hemisphere continued to affect the Dominican Republic, and shortages of certain manufactured items, especially tires and transportation equipment, were serious. The government awarded to a Puerto Rican engineer a contract for the expenditure of \$2,000,000 for the improvement of port facilities at Ciudad Trujillo. In the fall of 1944 it began crystallizing plans for the expenditure of \$2,500,000 for improvements at San Pedro de Macorís, the chief sugar port of the republic. The government in August announced the opening in different parts of the country of low-cost dining rooms serving about 3,600 meals a day at a cost of 10 cents a meal. It also set up a register of unemployed persons. The minimum wage laws were extended to include added groups of food and garment workers. The government on July 24 authorized the use of \$50,000 in United States subsidiary coinage and simultaneously forbade the export of gold.

On May 29, 1945, Pres. Trujillo invited political leaders to reorganize the country's political parties, all of which (except the Dominican party) had been outlawed since 1930; he announced that the country had progressed far toward political maturity and that new parties might function either in co-operation with or opposition to the government. He also invited political exiles to return to the country and guaranteed them safety and freedom of action. His opponents were slow to take advantage of these generous offers, however, and seemed skeptical of the president's good faith. The government created a new administrative department, Labour and National Economy, on June 1, 1945. Other administrative activity during the year included the establishment of an agricultural loan bank, announced April 7, and construction of low-cost housing for workers and governmental employees earning less than \$100 a month; for the latter purpose, the president in November submitted a bill to the congress for the

expenditure of \$5,000,000 for 25,000 such houses.

The foreign office announced in March that diplomatic relations with the U.S.S.R. had been established. Dominican representatives at the United Nations conference at San Francisco in June signed a nondiscrimination treaty with China. The Dominican Republic in September became the third state to sign the United Nations charter, with the congress also approving the statute setting up the International Court of Justice. A mission representing the United Nations Relief and Rehabilitation administration visited the republic in April to arrange for contributions and the government subsequently announced that it would make a preliminary gift of \$350,000, two-thirds of which would be paid in corn. It subsequently made additional payments recommended by U.N.R.R.A., bringing its total contributions up to \$1,400,000. The end of World War II brought relaxation of a number of wartime restrictions affecting economic activity; the government removed import controls on all but a few critical items on Oct. 1, 1945. The United States in the same month revealed that military lend-lease goods supplied to the Dominican Republic up to July 1945 had amounted to \$1,140,000 in

value. The government announced late in 1945 that it expected a new 360,000-barrel cement plant to be completed by the end of that year.

A new labour law dated Jan. 4, 1946, established an 8hour day and a 48-hour week for various classes of workers, but the alleged ambiguity of the law led to restlessness among labouring classes in subsequent weeks. The government in July paid its full assessment of \$12,250 to the working capital fund of the United Nations, according to announcement made Aug. 1 by Sec. Gen. Trygve Lie. The republic made elaborate plans to celebrate the 450th anniversary, on Aug. 4, 1946, of the founding of Ciudad Trujillo (named Santo Domingo until 1936) by Bartolomé Columbus. On the same day, however, the country's most serious disaster in many years struck in the form of a heavy earthquake, followed by a disastrous tidal wave in the northern part of the republic. Cities most seriously hit by the quake were Santiago, San Francisco de Maçorís and Puerto Plata; the inland town of Moca (pop., 8,720) also suffered loss of life and much damage, as well as the smaller localities of Matanzas and Samaná. Repeated, but lesser, shocks came in the two weeks following the original

Donations and Bequests

Despite the demands of World War II and increased taxes upon private resources, philanthropy in the United States reached new heights during the decade 1937–46. Total philanthropy in the United States was estimated at \$639,862,000 in 1936, and \$752,152,000 in 1937. By 1945, U.S. philanthropy had reached \$2,397,652,000.

While the war years found philanthropic interests directed largely toward war causes, philanthropy as a whole did not suffer greatly. The general average of giving showed an upward trend.

An index could be found in a study of giving in six cities, compiling publicly announced gifts of \$1,000 or more in six large cities—New York, Chicago, Philadelphia, Baltimore, Boston and Washington. The results of this study showed total gifts and bequests in the six cities amounted to \$107,910,706 in 1936 and \$183,347,000 in 1045.

On the basis of this index and other available statistics, the following conclusions (aside from the increase in giving) regarding philanthropy in the decade could be drawn: (1) war conditions brought forth many warrelated philanthropic causes which received support to an unprecedented degree, but the established giving-public did not desert its normal philanthropies; (2) there was evidence that new giving habits were created; many who gave to war causes had never before been contributors; (3) the weight of taxation may have cut the size of some gifts but, on the whole, it apparently had no adverse effect; (4) management and labour participated in philanthropy to a greater degree than ever before.

On the basis of the best statistics available, it seems reasonable to estimate that the U.S. public gave at least \$1,500,000,000 in cash and kind to war philanthropies during the decade. With this tremendous outpouring of contributions, the question naturally arises as to its effects upon normal philanthropies. One source of evidence, bearing on this question, may be found in the wartime support of community chests, an established means of financing local and permanent philanthropic needs.

A continuing study, made over a period of years, of 29 of the larger community chests having annual goals of more than \$500,000 showed that these chests in 1936 raised \$33,681,068. In 1945, these same 29 chests raised \$53,577.232 for their usual services. In addition, they raised \$28,953,705 for war causes. These figures indicated that generous support of war philanthropies did not affect adversely such causes as health, welfare and recreation.

Support of education during the decade was also maintained at a reasonably high level despite the demands of war. A study of gifts and bequests to 51 colleges and universities showed that for the ten years between 1930-31 and 1939-40 the average annual total of gifts to these institutions was \$42,374,000. There was a decline in giving during the years 1941 and 1942 but, by 1945, the yearly average had again risen to \$45,237,000.

The average of giving to education—as indicated by the statistics of 51 institutions—in the decade ending with 1946 was somewhat below the average for the decade ending with 1936, but with the end of the war conditions many of these institutions began to seek funds for purposes which were deferred during the war, and there was reason to foresee a decided upswing in giving to educational causes.

Two important factors in U.S. philanthropy during the

decade were increased philanthropic support by both management and labour. Figures of the United States government showed philanthropic contributions by corporations and firms during 1936 of approximately \$30,000,000. While government figures for later years were not yet available at the end of the decade, it was estimated that corporate and business gifts to philanthropy had reached \$175,000,000 in 1944, and probably were reduced but little in 1945 and 1946, with the decrease in goals sought by war organizations.

One index of the upward trend in corporation giving during the ten years could be found in the statistics of community chests and councils. In nation-wide community chest campaigns held in 1936, a total of \$81,707,787 was raised, and it was estimated that 25% of this came in corporate gifts. Of the total of \$90,379,099 raised in 1941 by community chests, 27.2% came from corporate gifts. In 1945, all community chests raised \$188,377,310 and the corporate gifts represented 34.2% of this amount. This increase was presumably the result, in part, of support of war philanthropies included in chest goals.

The element of business interest was not as easily demonstrated in many peacetime philanthropies as in wartime causes. Over the decade, however, there was a changing philosophy on the part of corporations with regard to philanthropy. The corporation came to regard itself as a part of the community and not as an organization which was apart, bound by by-laws and constitutions. Corporations recognized that what was good for the community was good for the corporation. A survey showed that 67% of business executives questioned indicated their belief that corporations and businesses had a responsibility to support community projects for common health and welfare.

Employees had always been a fruitful source of support for philanthropic purposes, but the decade saw the organization of employee-giving raised to new levels. Organized labour assumed definite responsibilities for participation in philanthropies and greatly increased the total sum of contributions coming from employees for philanthropic purposes.

The C.I.O. War Relief committee and the League for Human Rights of the American Federation of Labor were organized to centralize the giving of labour for war projects. Evidence of the extent of giving could be found in reports that the C.I.O. members gave \$33,157,174 to community war funds and the American Red Cross in 1944, and the American Federation of Labor gifts were estimated at \$40,000,000 in the same year. These figures indicated that organized labour was giving at the rate of nearly \$75,000,000 to war causes alone when the end of the war came. It is probable that an equal amount was given to normal community welfare causes.

The progress made in philanthropy during the decade was stimulated, in part, by war conditions and the readiness of the public to give in support of war purposes. Nevertheless, there was good evidence that normal philanthropies, exclusive of war causes, were not neglected but actually picked up new support in the face of war, increased taxation and decreased yield from capital investments. There was no doubt that the U.S. sense of responsibility for philanthropy had developed to an unprecedented degree during the decade.

During 1946, public announcements were made of more than 400 special fund-raising campaigns with total goals in excess of \$1,500,000,000. Thus the demands on the generosity of U.S. citizens was great. There was every reason to

believe, however, that the response would be generous but in proportion to the merits of the case presented. (See also Community Chest; Societies and Associations; War Relief, U.S.)

Philanthropy in Britain.—The outstanding donations from 1937 to 1946 in Great Britain were those of Lord William Nussield, motor manufacturer, whose benefactions were reported to have reached more than £25,000,000. In 1937 he gave £2,000,000 to found a trust fund to aid areas with severe unemployment and also £1,300,000 to Oxford university to found Nussield college.

Bequests and gifts tended to concentrate in three directions: a vast number of bequests to hospitals and charitable societies; frequent gifts to the treasury; and gifts of land and famous mansions to the National Trust (q.v.).

In 1938, part of the Duffryn estate known as the "Kew Gardens of Wales" and valued at £500,000 was made public property. In 1940, Bateman's, Rudyard Kipling's Sussex home, was given to the nation. In 1941, Sir Charles Trevelyan gave 13,000 ac. of moor and woodland known as Wallington to the public. Cliveden, a mansion overlooking the Thames at Taplow, was given to the National Trust by Lord Astor in 1942. Sir Courtauld Thomson gave his Buckinghamshire estate, Dorneywood, and 200 ac. to the nation to be used by ministers to entertain visitors from overseas. In 1943, Lord Sackville handed Knole, near Sevenoaks, to the National Trust for public use. In 1944, Sir Richard Acland gave the trust the deeds of his 16,000 ac. of estate in Devon and Somerset. Mrs. William Heelis (Beatrix Potter) presented the trust with 4,000 ac. of her Lake district properties. Famous historical buildings given to the nation privately were Kenilworth castle and Lindisfarne castle on Holy Island.

A number of minor properties, including cliffs at Land's End, were placed in the care of the National Trust through the anonymous activities of a group of benefactors called "the Ferguson gang."

Among donations to the national exchequer was £50,000 from Lord Rothermere in 1939 as a contribution toward national armament. Lord Baldwin in 1937 gave, on behalf of an anonymous donor, £250,000 to found the New Imperial Trust to encourage interimperial relations. In the same year the Ashley library in the British museum passed into national ownership through the beneficence of T. J. Wise.

To mark the coronation of King George VI, Lord Glanely gave £30,000 to educational and charitable institutions, and Sir John Siddeley the sum of £100,000 for developing farm schools. Among gifts to the treasury in 1940 was a diamond necklace presented by an anonymous woman. It was sold for £24,400 at Christie's.

On Oct. 18, 1946, Field Marshal Jan C. Smuts, prime minister of South Africa, presented a sum of more than £1,350,000 to Clement R. Attlee, premier of Great Britain. This was a national gift from the people of South Africa, made as an expression of admiration and faith in the people of Britain. The presentation took the form of certificates for gold lying in the Bank of South Africa.

Donovan, William Joseph®

Donovan (1889-), U.S. army officer and government official, was born Ian. 1, 1889, at Buffalo, N.Y. Educated at Columbia university, he received his law degree in 1907. He organized a cavalry troop in the national guard in 1916 and served in the Mexican expedition. Attached to the "Fighting 69th" division of New York state, Donovan fought in World War I and was decorated for valour by three governments. Appointed assistant in 1924 to Harlan Fiske Stone, then attorney-general, he was renamed to that post by Pres. Coolidge, serving from 1925 to 1929. He ran unsuccessfully for governor of New York state on the Republican ticket in 1932. In 1940, he made several trips abroad to gather information on nazi fifth-column activities in Europe and on the true state of Allied resistance to the axis.

On June 13, 1942, Donovan was appointed director of the Office of Strategic Services, a "super-secret" agency charged with procuring and integrating information on axis plans and dispositions during the war. On Sept. 20, 1945, Pres. Truman ordered abolition of the agency, transferring its principal functions to the state department. Donovan was named assistant counsel at the Nuernberg war trials, Nov. 8, 1945, but left this post three weeks later to return to private practice in New York. In Aug. 1946, he was appointed head of the American Institute of International Information, a nonprofit organization designed to seek information on world problems.

Doolittle, James Harold

Doolittle (1896—), U.S. army air officer, was born Dec. 14, 1896, at Alameda, Calif., and was a flying instructor in the army during World War I. After the armistice he resumed his studies at the Massachusetts Institute of Technology, receiving a doctor of science degree in 1925. An expert pilot, Doolittle won the Harmon trophy in 1930, the Bendix trophy race in 1931 and the Thompson trophy race in 1932. He later retired from racing and joined the army board studying reorganization of the air corps reserve.

Ordered back to active duty in 1940, Doolittle led a U.S. bomber squadron that staged the spectacular daylight raid over Tokyo, on April 18, 1942, the first on that Japanese city during World War II. He was awarded the congressional medal of honour for this exploit and was promoted to the rank of a brigadier general. Transferred to the North African theatre, he was named head of the Allied bomber command in northwest Africa in Feb. 1943, and the following December he took over command of the U.S. 8th air force based in Great Britain, later becoming a lieutenant general.

After the defeat of Germany in May 1945, he and part of the 8th air force were transferred to the Pacific, but the precipitate Japanese surrender prevented him from fully exploiting his air force. When he left the army Jan. 1, 1946, he became president of the Air Force association. On March 18, 1946, he was named head of a six-man board of ex-officers and enlisted men to investigate the army's much criticized caste system. The report, published on May 27, 1946, recommended the abolition of many terms overstressing the caste differences between officers and enlisted men. (For an account of the Doolittle raid on Tokyo, see Tokyo.)

Douglas, William Orville

Douglas (1898-), U.S. jurist, was born Oct. 16, 1898, in Maine, Minn. He was educated at Whitman col-

ity, gaining 28 seats in the provincial legislature.

Drug Administration, U.S.

The year 1937 marked a turning point in U.S. federal control of drug traffic. For four years legislation had been pending in congress, recommended by those responsible for food and drug law enforcement, to strengthen the protective provisions of the Food and Drugs act of 1906. Many committee hearings had been held on this and other food and drug bills subsequently introduced, but no new law had been enacted.

At the hearings and for many years in published reports of the chief of the Food and Drug administration it had been pointed out that the public could not be protected adequately under the existing law. There was no control over the distribution of new drugs or of dangerous drugs, no requirement that preparations for self-administration bear adequate directions and warnings. With the exception of a few specified ingredients, there was no requirement for the disclosure of the composition of secret "remedies." A joker in the 1906 act prevented court action against drugs bearing misleading claims except where guilty knowledge could be proved to the satisfaction of the court, thus putting a premium on ignorance of the therapeutic effects of medicines.

In Oct. 1937 the danger to public health of toxic drugs distributed under inadequate controls was dramatically publicized by a tragedy which resulted in more than 100 deaths in the 6 weeks that the responsible drug, "Elixir Sulfanilamide" was distributed. This preparation contained a toxic solvent but had been distributed without adequate tests. As soon as the first report of fatalities was received, the Food and Drug administration began a nation-wide roundup and recovered remaining portions of the drug. The secretary of agriculture, who was responsible for enforcement of the drug laws until the administration was transferred to the Federal Security agency in 1940, submitted a report at the request of congress on the "Elixir" incident, in which he pointed out the limitations of the law to prevent such tragic occurrences. He stated that while this case was spectacular, the actual toll of deaths from other drugs then on the market and from worthless nostrums offered for serious disease conditions was probably far greater.

Public demand for a stronger law gave new impetus to the passage of the pending legislation and on June 25, 1938, the Food, Drug and Cosmetic act became law. It corrected in large part the deficiencies in the 1906 act and brought profound changes in the production and distribution of drug products. While an adjustment period was provided for the orderly transition from the old to the new law, sections designed to protect the consumer against dangerous drugs and cosmetics went into effect immediately.

One such section related to new drugs, which could not be introduced into interstate commerce without filed applications establishing their safety for use. The Food and Drug administration's responsibility was serious; no valuable drug should be unnecessarily withheld from public use and, at the same time, new drugs should not be released without sufficient testing to establish their safety.

lege, Walla Walla, Wash., receiving his degree in 1920. After teaching high school for several years at Yakima, Wash., he entered Columbia university, receiving his law degree in 1925. He was admitted to the bar the following year. From 1925 to 1928, he lectured in law at Columbia and was associated with a private law firm in New York city. He joined the faculty of Yale university in 1928, eventually becoming a full professor and then Sterling professor of law. During the Hoover administration Douglas helped the department of commerce in analyzing bankruptcies. He was recalled to Washington, D.C., in 1934 to direct investigations conducted by the Securities and Exchange commission into bondholders committees and reorganizations. Douglas, who was commissioner and chairman of the SEC from 1936 to 1939, delivered an "ultimatum" to the New York Stock exchange to undertake self-reform or undergo government supervision. Wall street accepted self-reform, and thereafter relations between Douglas and "the Street" became more friendly.

On March 20, 1939, Pres. Roosevelt named Douglas as associate justice of the supreme court, succeeding Justice Brandeis, who had resigned the preceding month. An analysis of Douglas' court decisions from 1939 to 1946 indicated he sided with the "left side" of the bench, but also showed he had no incapacity for going along with the "right."

In 1944 Pres. Roosevelt informed the Democratic national party leaders that both Douglas and Harry S. Truman would be suitable to him as running mates if Henry Wallace was not renominated for the vice-presidency. Truman was selected.

Drew, George Alexander

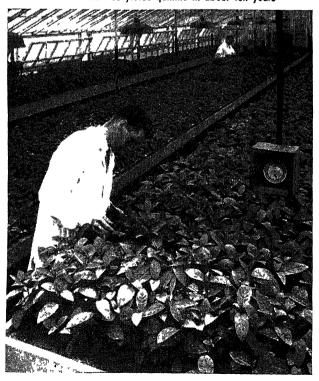

Drew (1894—), Canadian politician, was born at Guelph, Ont., May 7, 1894; he was educated at the Collegiate institute of Guelph, Upper Canada college and the University of Toronto. He enlisted in the Canadian expeditionary force in 1914, and went overseas a year later. Wounded in 1916, he was invalided home the following year and received his discharge from the army in 1919. Drew was admitted to the bar in 1920, practising in Guelph until 1925 and then in Toronto. Entering the provincial legislature, he became leader of the Conservative opposition in the legislature at Toronto.

Drew won prominence in 1942 by his denunciation of the government's action with regard to the Canadian expedition to Hong Kong. Although proceedings were initiated against him, they were dropped later. After formation of the Progressive Conservative party at the Winnipeg convention in Dec. 1942, Drew organized the party's forces in Ontario. In the general provincial elections in Aug. 1943 the Progressive Conservatives won the largest number of seats and Drew assumed the premiership and the portfolio of education. In the Ontario elections in 1945 his administration received an overwhelming major-

The new-drug provisions went into effect just at the beginning of the emphasis on chemotherapy. World War II accelerated progress in this field and resulted in the development of such potent agents as penicillin, streptomycin, tyrothricin and various sulfonamides with profound medicinal properties, and often with toxicities. Appraisal of the evidence relating to the safety of such drugs and the adequacy of production controls became increasingly complex. A total of 4,017 new drug applications had been allowed by the end of June 1946, which marked 8 years of enforcement of this provision.

The 1938 act was not intended to outlaw safe and efficacious self-medication. It required full directions for use and warnings against misuse on medicines to be sold to the lay public. The establishment by the federal security administrator of exemptions from this labelling requirement was provided where such directions were not necessary for the protection of public health. The first exemptions included prescription drugs. It developed that some manufacturers resorted to this exemption in marketing drugs commonly purchased and safely used by consumers, and omitted adequate directions from the labelling. This defeated the purpose of the act to give the consumer essential information about valuable drugs suitable for use without medical supervision. It also imposed a hardship on the retail pharmacist who had on his shelves bona fide prescription drugs and simple medicines for minor ailments, both bearing the prescription legend and both illegal for him to sell without a physician's prescription. Amended regulations became effective in Oct. 1945 designed to make a fundamental distinction between drugs which could be used by the public without medical supervision and those which could not.

Cinchona seedlings in a greenhouse of the U.S. department of agriculture at Glenn Dale, Md. Plantings were raised in quantity during 1943 as a substitute for quinine from the Netherlands Indies when normal supplies were cut off by the Japanese in 1942. The bark of the cinchona tree yields quinine in about ten years

Although seizures of violative drugs increased nearly fourfold in the ten-year period, statistics were of little value in comparing the drug picture of 1946 with that of 1937. In the latter year there were numerous worthless "remedies" on the market which the Food and Drug administration was powerless to remove from consumer channels. If a manufacturer could prove that he was so poorly informed concerning therapeutic values of drug products as to believe that worthless ingredients would cure diabetes, cancer, tuberculosis or other serious diseases, the preparation could not be removed from the market by seizure because the government could not prove fraud. After the 1938 act went into effect the offenders who had evaded court action for years under the fraud provisions of the old law, abandoned their practices either voluntarily or as a result of seizures, criminal prosecutions and injunctions brought in federal court. Products claiming the cure or alleviation of serious diseases of the type that would become difficult or impossible to cure if competent medical treatment were delayed became fewer every year. Actions increased against preparations bearing false and misleading therapeutic claims exploiting the consumer's eagerness to benefit from true scientific progress in the fields of vitamins and minerals. These preparations seldom affected the consumer's health, but they bore false insinuations of the inadequacy of the normal diet to supply required nutritional elements which resulted in a serious economic loss.

Progress in control of dangerous drugs included the immediate removal from the market, when the 1938 act went into effect, of such products as dinitrophenol, and the classification as prescription drugs of products, such as thyroid, unsafe to use without medical supervision. The requirement that all nonofficial drugs consisting of two or more ingredients bear the name and quantity or proportion of each active ingredient was also a safety provision for the physician and for the consumer acting as physician to himself.

In 1937, actions against official drugs (those listed by the U.S. Pharmacopoeia and the National Formulary) resulted largely from variations in active ingredients. By 1946, only about 20% as many actions were necessary for such violations. A far greater number resulted from injection drugs containing undissolved particles or failing to meet sterility requirements. This trend reflected the change by the medical profession from many drugs formerly used for oral administration to injection medicines. The former could often be properly assayed by a simple chemical test. A drug intended for intravenous injection required the same chemical analysis and, in addition, bacteriological testing for sterility, pharmacological testing for pyrogens and physical examination for foreign particles. Bacteriological examination was required, also, for surgical dressings, sulfonamides and other powders for use on open wounds.

During World War II, investigations were made at the request of the armed services into the toxicity and efficacy of many newly developed preparations under the various conditions of use to which they would be subjected. The administration tested all medical consignments purchased by the army, which averaged more than 1,000 a month at the high point of this program.

The act was amended in 1941 to provide for predistribution certification of insulin on a fee basis, and in 1945 similar control for penicillin was enacted. Insulin had previously been pretested under patents that were expiring, and penicillin had been tested and certified under war controls of the War Production board and the mili-

tary authorities. Both drugs were used for conditions that might lead to fatalities if they were not of the potency or purity required. The amendments were passed unanimously by congress upon recommendations by the Federal Security administrator that such control was essential to public health. Dulles, John Foster

Dulles (1888—), U.S. lawyer and government official, was born Feb. 25, 1888, in Washington, D.C. He was graduated from Princeton university in 1908, and received an LL.B. degree from George Washington university, Washington, D.C., in 1911. He entered a law firm in 1911, becoming a senior partner of the firm in 1944. During World War I, he was a captain, and later a major in the army and was attached to the general staff. Following the armistice, he was assigned to the U.S. delegation as principal counsel on the Paris Peace Conference committee and helped draft provisions dealing with reparations and financial matters.

Returning to the U.S., he resumed his law practice, soon establishing a reputation as an authority in international law. When Dulles supported Governor Thomas Dewey in the 1944 presidential campaign, it was generally assumed that he would be Dewey's selection for secretary of state in the event of a Republican victory.

Dulles was named as an adviser to the U.S. delegation to the U.N. April 5, 1945. He accompanied Secretary of State James Byrnes to the first conference of the Council of Foreign Ministers in the early fall of 1945 and on his return to the U.S. he declared Oct. 6 that Byrnes was entitled to support from all political factions. He attended the U.N. sessions in London (Jan.—Feb. 1946) and later in New York city and in Lake Success participated in the trusteeship debates in November.

Duplessis, Maurice Lenoble

Duplessis (1890—), Canadian politician, was born at Trois Rivières, Quebec, April 20, 1890, the son of French-Canadian parents. He was graduated from Laval university, Montreal, where he obtained B.A. and LL.B. degrees. In his first candidacy for the Quebec legislature in 1923, he was defeated. Four years later he stood again and was elected. He was re-elected in 1931, 1935 and 1936. He was chosen leader of the Quebec Conservative party at its convention in 1933, but just before the national elections of 1936, he formed his own party, the Union Nationale. Duplessis' party defeated the Liberal party, which had been

in office for 39 years, and Duplessis was sworn in as premier Aug. 26, 1936. Shortly thereafter he instituted the "padlock law" which made it illegal for anybody owning or renting a building "to use it . . . to propagate communism or bolshevism by any means whatsoever." Another provision of that law made it illegal to print or distribute any newspaper or periodical that propagated or "tended" to propagate "communism or bolshevism." His party was re-elected in the provincial elections of Aug. 8, 1944.

Dutch Literature

Before the German invasion of May 1940, the older generation of leading Dutch poets and critics, such as J. Greshoff, H. Marsman, Dr. Menno ter Braak and E. du Perron, took sides in the crisis of European civilization. Even such a retiring and introvert figure as the poet A. Roland Holst (Een winter aan zee, 1937), wrote a few verses with a prophetic-political turn, as did the Catholic lyricist Jan Engelman. An interesting discussion of Christianity was contributed by Ter Braak (Van oude en nieuwe Christenen, 1937), Anton Van Duinkerken (Verscheurde Christenheid, 1937) and H. Bruning (Verworpen Christendom, 1938). A group of younger writers did not link their verse so intimately with the cultural and spiritual crisis. Their views were most clearly expressed in the new periodical Criterium, at first under the leadership of E. Hoornik. Realities soon forced them, however, to choose sides openly, although their preference for narrative and romantic poetry remained conspicuous.

Among the older generation, the great novelist Arthur van Schendel was particularly important because, after a period of producing typical Dutch tales full of sombre motives of destiny, he began in 1938 a series of novels richer in fantasy (De Wereld een Dansfeest, 1938; De zeven Tuinen, 1939). To the best prose works of these years also belonged S. Vestdijk's Het vijfde Zegel (1937), and F. Bordewijk's Karakter (1938). The death of Albert Verwey (1865–1937) and of Willem Kloos (1859–1938) marked the end of the Nieuwe Gids group, whose influence had, indeed, long since disappeared.

The year 1940 saw the suicide of Dr. Menno ter Braak (1902–40), the death of E. du Perron (1899–1940), and of the poet and critic H. Marsman (1899–1940). Among other victims of World War II were the poet Jan Campert, the Hispanophile and novelist Dr. Johan Brouwer, the painter and essayist W. Arondéus, the narrator A. M. de Jong and the philosopher Prof. Leo Polak.

The German authorities did not at first interfere directly with literary life, although many works of Jewish and leftist writers were banned. Among the most remarkable publications of the early years of World War II were: Van Schendel's *Eeuspel der Natuur* (1942), Vestdijk's *Rumeiland* (1940) and Theun de Vries's *Tegels van de*

Haard (1941). A collection of essays by the director of the Rijksmuseum, Dr. F. Schmidt Gegener, was published posthumously under the name "Phoenix." In verse, the collection Tusschenspelen by P. C. Boutens (1870–1943) and the clandestinely distributed In Memoriam Ter Braak et Du Perron by A. Roland Holst made a great impression. Anonymous political verses appeared almost immediately after the occupation. The formation of the Dutch "Kulturkammer" (April 1942) imposed upon every author the choice of submitting to the German measures or of being silent. There was a third choice: publication in secret. One of the leading figures among the resistance movement of the men of letters was Prof. N. A. Donkersloot.

Owing partly to the growing atrocities, the stream of so-called "Gueux" songs (Geuzenliederen) increased. To these secret publications, the work of a few dozen printers, some of whom paid for them with their lives, the Netherlands owed several hundred curious issues. The publishing house De Bezige Bij devoted the proceeds to help the illegal action. As practically all periodicals were suppressed, clandestine journals appeared out of which, after the liberation, new periodicals were formed.

The death of Ter Braak proved an irreparable loss to Dutch criticism; in the poetical field Gerrit Achterberg and Bertus Aafjes came to the fore during World War II and J. C. Bloem stood out among the older writers. In prose, the harvest was poor; with Arthur van Schendel (1874–1946) the only master novelist passed away. In spite of interesting work by A. Defresne, drama remained the weakest spot in Dutch literature. (G. Sc.)

BIBLIOGRAPHY.—J. Greshoff (editor), Harvest of the Lowlands (1945).

Dutra, Eurico Gaspar

Dutra (1885-), Brazilian statesman and army officer, was born May 18, 1885, in Cuiabá, Brazil. After a cursory education in primary and secondary schools he joined the army as a private in 1902. He attended the Brazilian Military school in Rio de Janeiro, 1904-08, completing his work as an officer candidate, and was commissioned as a 2nd lieutenant in 1910. In 1932 Dutra, who had become one of the leading members of the Brazilian officers' clique, helped put Getulio Vargas in the presidency by means of a coup d'état. Later, Dutra helped put down an anti-Vargas rebellion in São Paulo state and in 1936 the grateful Vargas appointed him minister of war. Although Dutra apparently was no confirmed believer in democracy and had shown authoritarian leanings, his sympathies were with the Allies in the war against the axis. After Brazil declared war against Germany and Italy in Aug. 1942 Dutra helped build up the Brazilian army, with the aid of U.S. equipment, into a sizable force. In Oct. 1945 when Vargas was forced to resign the presidency and call national elections, Dutra became his hand-picked candidate. Dutra defeated his opponents and was sworn in as president, Jan. 31, 1946, for a six-year term. In the summer of 1946 he ousted Communists from government offices and suspended a Communist newspaper that protested the action.

Dyestuffs

In 1937, the U.S. dyestuffs industry had attained a position of key importance in the nation's economy. Prior to World War I, the production of dyes in the United States had been insignificant. Practically all of the requirements were imported from Germany, and the

loss of foreign sources of supply placed colour-consuming industries in a precarious position. Early in 1915, steps were taken to establish a U.S. industry; the government provided the necessary tariff protection. Many patents which Germany had taken out in the United States and which had virtually prevented the establishment of a U.S. dye industry were seized and made available to U.S. manufacturers. These factors acted as a stimulus toward the creation of a self-contained industry, and progress thereafter was rapid. Despite the return of imports in the early 1920s, the expansion of domestic capacity resulted in their gradual displacement. The U.S. valuation method of tariff protection proved to be exceptionally effective in promoting the development of newer and more complex dyes. The 20-year period from 1917 to 1937 witnessed the further expansion of the U.S. industry even though foreign interests re-established themselves in the United States, both as producers and as selling agents for imported dyes. Table I illustrates the supply position of the United States in 2 representative peace and war years:

Exports to total sales of do- mestic dyes	14.2	13.0	9.7	14.5	

Production of dyes in the United States followed a steady upward trend during the two interwar decades and reached a peak in 1941 of 168,595,000 lb., exceeding the previous year's output by more than 30%. This expansion was primarily due to the demands for textiles from the rapidly increasing military forces. The industry continued to supply an active civilian market both for current consumption and stock piling in anticipation of probable entrance into the war. The utilization of vat colours became more widespread, and the quality and fastness of the dyed materials were better than ever before. In 1939, U.S. manufacturers supplied more than 95% by weight of U.S. apparent consumption. Following the outbreak of hostilities in Europe and the subsequent disruption of overseas communications, U.S. production greatly expanded. In 1940, manufacturers supplied almost 98% of the quantity consumed in the United States which rose to 99.5% in 1943 and 1944. The indispensability of an integrated chemical industry to the welfare and security of the United States was particularly significant.

Facilities for the manufacture of dyes were substantially expanded in connection with the war program. More than \$2,500,000 went into the building and processing equipment needed for the increased production of military vat dyes. Many organic chemicals and intermediates normally required in dyestuff synthesis were utilized in the defense program for the manufacture of explosives, aviation gasoline, pharmaceuticals, refrigerants and synthetic rubber.

Conservation of raw and finished materials was the industrial keynote for 1942. The national emergency brought about many drastic and sudden changes. Government consumption of certain vat colours used for olive drab and khaki shades had increased abnormally long before U.S. entrance into World War II. A growing demand for civilian goods coloured with fast dyes manifested itself. The dyestuff industry stepped up production on the vital war colours. With the military program developing rapidly,

it became evident that the production of these particular anthraquinone vat colours would be insufficient to fill all the requirements of the government. This brought about the War Production board's conservation order M-103, effective April 1, 1942. It restricted the sale of nine anthraquinone vat dyes exclusively for military purposes and assured mills holding government contracts of a sufficient supply of vat colours. Quarterly civilian quotas on anthraquinone vat dyes not restricted for military use were also established, and the use of dyes, other than vat, for non-military purposes was reduced to 60% of the quantity consumed in 1941. The lowered output of dyes was due to the government curtailment in the supply of cotton textiles for civilian use and the scarcity of many basic raw materials needed for civilian dye production.

A similar situation existed in 1943 and 1944. Increased consumption of dyes for military use was offset by decreased civilian consumption, the total 1943 production being 5% less than that of 1942. The sale of certain vat colours continued to be restricted for military use only. Civilian requirements were allotted what was believed to be sufficient for civilian needs. It was the policy of the War Production board to make available dyes of high quality and performance in order to maintain the standards of civilian textiles as close as possible to the desirable properties of fabrics processed during peace.

World War II was also largely responsible for the development of new fibres and materials for specialized uses. Fibres were given numerous treatments such as shrinkproofing, resistance to creasing, water repellency, mildewproofing and flame-proofing. These entailed the use of waxes, resins and other chemicals and necessitated modifications in dyeing and finishing procedure. Through research carried out in dyestuff laboratories, new dyes were developed and processes devised that were capable of withstanding many of these treatments without deterioration of colour or fastness properties. Dyestuff manufacturers improved dyeing and application techniques as well. These made possible the continuous processing of delicate fabrics with minimum distortion, crushing or chemical deterioration, thus extending the application of vat colours to a wider variety of materials than before. Woolens, spun rayons and various combinations of animal, vegetable and synthetic fibres could be dyed with vat colours by a continuous method which minimized the variables and mechanical difficulties formerly restricting the use of these exceptionally fast colours.

During the first eight months of 1945, efforts were directed toward the production of adequate quantities of military dyes to satisfy government requirements. Many of the restricted vat colours had to be produced at a rate 200 times the normal prewar demand. It was also recognized that should the war end suddenly, sizable stocks of these colours would be on hand plus material in process. The surplus could not be avoided because of the time required in manufacturing a dye and the inability to change over, once the operation was under way.

That situation existed on Aug. 20, 1945, when conservation order M-103 was rescinded. While material was made available for reconversion and civilian use, results were not immediate, and the industry was left with the problem of disposing of heavy inventories of military colours. Their exceptional fastness made them particularly desirable for heavy-duty fabrics, and dyeing formulas for civilian shades were developed incorporating these colours.

Reconversion began soon after V-J day. Military-type dye inventories held by textile mills were taken over by the government and declared surplus property. Although

the dye industry had to make extensive shifts in the relative importance of different dyes produced, a return to the normal pattern presented comparatively few difficulties. The technical and mechanical changes involved were relatively simple, consisting largely of the realignment of equipment without large-scale replacements or alterations but required time. The colours most urgently needed were first put into production, and by the end of 1945 practically all groups of colours were again manufactured but not in sufficient quantities to fill the heavy demand for both domestic and export purposes. Total production of dyes in 1945 was 144,000,000 lb. compared with 152,000,-000 lb. in 1944. A substantial decline in the production of vat colours occurred, but this class continued to be the most important and accounted for 34% of the total production of dyes in 1945.

An active demand for all types of dyes was evident, but strikes in the steel and coal industries as well as the usual lag in production of dyes behind seasonal trends in the textile trades, prevented the dye industry from completing the expected major readjustments in 1946. The supply of many raw materials and intermediates was still insufficient to meet all requirements, but it was considered to be only a matter of time before most of these shortages could be overcome. A wider variety of colours would shortly become available, since many dyes were developed during the war which had previously been imported. The United States dye manufacturers were in a stronger competitive position than ever before; their efficiency had reached a high level, and new technical methods and processes had been developed.

Germany.—Before World War II, Germany was the principal source of dye imports into the United States and the most important competitor of the domestic industry in export trade. The German dye industry developed many new products, and the ability of Germany to wage a global war was largely due to its organic chemicals industry. In 1939, 155,000,000 lb. of dyes were produced, of which 50% were exported. Germany controlled plants in almost every dye-producing country in the world, including the United States. Much of the ground lost by German dye manufacturers during World War I had been regained and its position was strong. After Germany's defeat, the Allied Control council ordered the seizure of all plants and assets.

United Kingdom.—The pattern followed by the British dyestuff industry closely paralleled that of the United States. In 1913, the total production was only 9,000,000 lb., reaching a high of 63,000,000 lb. in 1937, then dropping off in 1938 to 45,500,000 lb., of which 9,000,000 lb. were exported. The industry was integrated and strengthened its equipment and manufacturing technique considerably during the war.

Switzerland.—Dye production amounted to 16,000,000 lb. in 1938 and 20,000,000 in 1939. Before World War II, Switzerland exported more than 90% of its entire output of dyes. The average unit value of Swiss exports of dyes was considerably higher than that of any other country.

Japan.—Prior to the war, Japan was the fifth largest dye-producing country in the world. Until 1931, development of the industry had been hindered by outside competition, but the desire of the government to increase its country's military potentialities led to heavy subsidies and effective protective duties. Sulphur colours were the most important group of colours manufactured during the 1930s, but large gains were also made in the production

of other groups of colours.

France.—In 1938, 20,000,000 lb. of dyes were produced, and exports amounted to 9,500,000 lb., consisting chiefly of the lower priced bulk colours. Principal customers were Germany, Belgium, the Netherlands, China and Czechoslovakia.

Italy.—Before the war, Italy had a substantial dye industry and exported appreciable quantities to countries other than the United States. In 1939, 31,000,000 lb. of dyes were manufactured, of which 43% were represented by sulphur colours. Important markets were Germany, Balkan states and the far east. Production apparently diminished after 1939 owing to difficulties in obtaining raw materials. (See also CHEMISTRY.) (A. G. BR.)

Dykstra, Clarence Addison

Dykstra (1883–), U.S. educator, was born Feb. 25, 1883, at Cleveland, O. He studied at the University of Iowa, graduating with a B.A. degree in 1903. In the early 1900s he taught at several U.S. universities and was chairman of the department of political science at the University of Kansas; he was associated with that institution from 1909-18. He then abandoned his academic career temporarily to become executive secretary of the Cleveland, O., Civic league and held similar offices at Chicago and Los Angeles. For seven years (1923-30) he taught at the University of California and in 1930 he was selected city manager of Cincinnati, a post he retained until 1937, when he was named successor to Glenn Frank as president of the University of Wisconsin. On Oct. 12, 1940, Dykstra accepted the post of director of selective service after the university granted him leave of absence. He held this post until April 1941. Concurrently, he held other positions connected with the government service and was chairman of the National Desense Mediation board until June 1941. He resigned as president of the University of Wisconsin on Oct. 28, 1944, to become provost of the University of California, at Los Angeles.

Eaker, Ira C.

Eaker (1896-), U.S. army air officer, was born April 13, 1896, in Field Creek, Tex. He studied at the University of the Philippines, Columbia and Southern California universities, and was commissioned as second lieutenant in the infantry reserve in 1917. In 1929 he was co-pilot in an army plane which established an endurance flight record of 150 hr. and 40 min., and some years later he made a cross-continent "blind flight." In

Jan. 1942 he was made brigadier general. He was appointed chief of the U.S. bomber command in the European theatre of operations in the summer of 1942, and on Feb. 15, 1943, having been advanced to the rank of major general, became commander of the 8th U.S. air force, succeeding Maj. Gen. Carl Spaatz. Promoted to lieutenant general in Oct. 1943, he was appointed, on Dec. 28, commander of all Allied air units in the Mediterranean theatre. On April 24, Eaker was named deputy commander of the army air forces and chief of the air staff.

Ear, Nose and Throat, Diseases of

The decade 1937-46 was replete with improvements in the surgical treatment of deafness, and inspirational advances in the research and study of the physiology of the nose and ear were made.

Julius Lempert's fenestration or window operation in the surgical treatment of deafness caused by otosclerosis was outstanding. His record of 1,000 patients with 57% completely rehabilitated by restoration of hearing and an additional 9% partially rehabilitated was impressive.

The use of the cartilaginous stopple in the fenestrum was not taken up with complete enthusiasm by all otological surgeons. Edward Campbell of Philadelphia gave a fine résumé of surgical progress in the treatment of deafness and felt that Lempert's operation offered the only real solution to otosclerosis deafness.

Lempert created a mobile window in the membranous and extracartilaginous portion of the external auditory canal which gave him an approach to any part of the temporal bone. It is technically called the endaural, antauricular approach to the temporal bone. With this approach he was able to perfect a new technique for the alleviation of deafness caused by otosclerosis. He finally accomplished a one stage endaural plastic reconstruction, incorporating the following principles: (1) the decompression and mobilization of the fluid beneath the bony capsule (the perilymph) by constructing surgically a troughshaped fenestrum ("window") in the bony capsule of the external semicircular canal at first, and later changed to the vestibule in a newer technique; (2) replacing the removed area of bone with a cartilaginous stopple; (3) and arresting the progressive stasis by decompression of the dura of the temporal lobe in the region of the epitympanic

Deafness in Children.—A great interest arose in the hearing defects of children. Most large cities such as New York, Philadelphia and Baltimore continued to make routine audiometric studies on all school children in the lower grades.

Remarkable work on this subject was done by S. J. Crowe and John W. Baylor of Baltimore in 1939. They observed that long-continued partial obstruction of the eustachian tubes in children caused retraction of the ear drums, impaired hearing for high tones, with relatively good hearing for low tones, and sometimes caused a total loss of hearing by bone conduction. Detailed observations were made of 60 children, in some cases for 10 years. The most satisfactory method of treatment was irradiation with radium or Roentgen rays. After the hyperplastic lymphoid tissue had been reduced and the tubal orifices looked normal, the hearing for high tones and for boneconducted sounds often returned to normal. The authors concluded that the most common type of middle ear deafness in adults begins during childhood. If school children in the primary grades were examined at least once a year with a nasopharyngoscope, and those with hyperplastic

lymphoid tissue in and around the orifice of the eustachian tube were treated with radiation as often as necessary to insure normal functioning of tubes, the authors believed the number of deaf adults in the succeeding generation could be reduced by 50%.

Aero-otitis Media.—Inflammation of the middle ear, either catarrhal or suppurative in type, came up as a distinct problem among flying personnel during World War II. If treated at once, simple conservative measures effected a cure; if allowed to proceed, pus formed in the middle ear and required surgery. Prevention was the keynote. Fliers should not go aloft if there is any evidence of acute rhinitis or acute sinusitis. Rapid descent appeared to be more important in causation than ascent; also, if the mouth were kept open or swallowing was practiced, the number of cases could be reduced. Proper ventilation of the middle ear by way of the eustachian tube was imperative for prevention and treatment.

Acoustic Trauma and Deafness.—World War II was instrumental in causing loss of hearing in many thousands of young men. Walter Hughson estimated the number at 250,000, including losses from slight to profound. Sudden loud explosions, as of high calibre artillery, caused more scrious damage to the inner ear than did the lower-pitched noises of rifle or machine gun fire. Major Borkis of the British army recorded that most cases of nerve deafness persisting for six months after blast injury to the ear did not improve. Sulfonamides were used to clear up infection resulting from ruptured drums, the average stay in the hospital being 14 days.

Tympanosympathectomy.—A new operation was devised by Julius Lempert for the relief of patients suffering from chronically persistent tinnitus aurium (noise in the ear). Fifteen patients were operated upon and ten were cured. The operation was based on the theory that the ganglion cells in certain cases are either acutely or chronically inflamed. Hence, with the removal of these cells in the tympanic plexus of nerves a cure should result in those cases in which ganglionitis is a causative factor. The operation in brief consisted of (1) widening the outer membranous third of the auditory canal to permit as wide a speculum as possible; (2) disengaging the lower half of the drum; (3) everting the disengaged half to expose the tympanic plexus; (4) excision of the tympanic plexus; and (5) replacing the disengaged portion of drum into its normal position.

The cases had to be carefully selected and carefully operated upon, and there was no guarantee that all would be cured.

Nose.—A great deal of work was done on the physiology of nasal secretions. Although the aetiology was still obscure, new and important facts concerning the secretions in the nose came to light—secretions in health and disease. Normally the nose was found to be slightly acid, pH between 5.5 and 6.6 as compared with neutral 7, pH standing for hydrogen ion concentration. During acute cold and during intense emotion the secretions became alkaline.

Hence, treatment to be of benefit should be such as to return the nose to its normal or acid condition. Vasoconstrictors were no longer recommended promiscuously. Secondary dilatation became so well known that only the mildest of vasoconstrictors were used as a temporary stopgap until aetiology could be determined and more effective therapy instituted.

Nasal plastic surgery or rhinoplasty had become a real art, combining itself with physiologic concepts so that people might breathe better and look better at the same time. Good results were further enhanced by the use of penicillin and sulfonamides to prevent complications. The one-stage operation for correction of internal and external deformities of the nose came to be considered good surgery, saving time, expense and unnecessary hospitalization.

Arthur W. Proetz, clinical professor at Washington university, St. Louis, Mo., in his book Applied Physiology of the Nose, definitely brought together concepts on how the nose functions, developed up to 1941. The importance of ciliary action, of a protective mucous blanket, of submucous phagocytic and wandering cells, of lysozyme and of conservative surgery were all stressed in minute and convincing detail, based on experimental and clinical evidence.

Sinuses.—Aero-haematoma was discussed as a new entity: blood in a sinus encountered among fliers caused by sudden high ascents or obstructive aerosinusitis. Twelve cases were encountered over a period of two years, by R. Wesley Wright and Harold M. E. Boyd. These cases were treated successfully by conservative measures, shrinking packs in the nose and occasionally sinus lavage. The outstanding symptom was pain, coming on during actual or simulated flight. Other symptoms were soreness over the sinus areas, numbness of the face and teeth, discharge of fresh or old blood from the nose and occasional dizziness. With the advent of increased flying this new condition was kept in mind with its diagnosis and simple therapy.

Allergy in the Ear, Nose and Throat.—Joseph E. Sternberg warned against the abuse of vasoconstrictors in hay fever and vasomotor rhinitis. Nasal obstruction persisted in several cases in spite of continued use of vasoconstrictors, but the condition cleared up within five days of nontreatment. His belief was that vasoconstrictors should be used as a spray only, and not more than once or twice in 24 hours.

Benadryl, a new antihistamine drug, was found to be of value in allergic conditions, angioneurotic oedema and similar complexes. Histamine was indicted as the probable injurious agent and research work was done to produce this anti-histamine drug.

Benadryl was given to 72 patients whose complaints embraced vasomotor rhinitis, definite perennial allergic rhinitis and nasal allergy associated with asthma. Marked improvement or complete relief from nasal congestion and its associated symptoms occurred in 50% of the group with vasomotor rhinitis and in 42% of the group with perennial allergic rhinitis. Only four of the eight patients with associated asthma were definitely improved.

Benadryl and pyribenzamine were not the answer to a physician's prayer for a solution to allergic problems, but they did permit him to alleviate symptoms while he studied the patient for actual cause.

Penicillin in Otolaryngology.—Lt. Col. Gilbert C. Struble reported on the successful use of penicillin in otolaryngologic conditions in army personnel. Detailed, convincing descriptions of symptoms and therapy were outlined, and included such cases as acute and chronic empyema of the antrum, acute and chronic suppurative otitis media, superficial and deep cellulitis of the neck, etc., with the following general conclusions. Although penicillin is of great value in many diseases of the ear, nose and throat, it should not be relied upon to prevent impending intracranial complications of aural or sinal origin. Penicillin should be given directly into the spinal fluid if brain or meninges are involved. Also, it can be combined with sulfonamide therapy successfully, one appearing to en-

hance the effect of the other. Penicillin, like sulfonamide compounds, can give an effect masking the presence of disease unless the attending physician is alert to this possibility. Above all, the general principles and indications for surgical drainage remained unchanged during the decade 1937–46.

Larynx.—Much progress was made in the treatment of cancer of the larynx. If it is at all operable, most outstanding surgeons feel that laryngofissure or laryngectomy is the method of choice. Max Cutler of Chicago treated 118 unselected cases of laryngeal cancer by X-ray alone and obtained 42% five-year cures, and 39% three-year cures. Concentration radiotherapy resulted in the curing of certain forms of cancer of the larynx formerly regarded as incurable.

In general, Cutler felt that laryngectomy should be limited to intrinsic lesions with complete fixation of the vocal cords occurring in good surgical subjects of good life expectancy.

The study of laryngeal function, both in health and disease, received quite an impetus with the improvement in colour photography of the larynx. Louis H. Clerf of Jefferson Medical college, Philadelphia, contributed a historical and modern outline of laryngeal photography in 1941. He presented his own contribution of a photographic unit embodying the principle of the Garel camera. This simple apparatus for photographing the larynx by mirror laryngoscopy could be readily employed, because it required no additional personnel to operate and gave uniformly good results in a majority of patients whose larynges could be visualized by mirror laryngoscopy.

Gabriel Tucker of the University of Pennsylvania repeatedly emphasized the value in teaching of rapid colour motion picture films of the larynx, because it represents the living larynx exactly as it appears in the body and without distortion.

Ménière's Symptom Complex.—A complex characterized by deafness, tinnitus and vertigo received a new type of therapy from H. I. Lillie, B. T. Horton and W. C. Thornell.

There were 25 cases, 18 men and 7 women; the drug used was histamine, 2.75 mgms. in 250 c.c. of isotonic salt solution, and was given intravenously slowly. It was given daily for three to six days, then subcutaneous injections were given and gradually tapered off according to the response to treatment. Audiometric studies were made before and after treatment; 12 of the 25 patients showed improvement of hearing, in 6 improvement was noticeable, in 3 moderate, in 3 slight; tinnitus was improved in 14 patients and 21 noted improvement in vertigo. It was concluded that many persons with Ménière's symptom complex were improved in their hearing, tinnitus and vertigo with this new type of therapy. (See also Infantile

(G. M. C.; G. E. L.)

Earhart, Amelia

Miss Earhart (Mrs. George P. Putnam) (1898–1937), U.S. aviatrix, was lost in the Pacific ocean during a round-the-world flight starting from Miami on June 1, 1937. Despite an extensive search by the army and navy, no trace was found of the flyer or her plane. Born July 24, 1898, she had successively been a nurse in Canada during World War I, a research worker, social worker, flyer, editor and lecturer. She established the following aviation records—first woman to fly the Atlantic, to fly in an Autogiro, to cross the United States in an Autogiro, to fly non-stop across the United States and to fly from Hawaii to the United States. In 1931, she had married the publisher, George Palmer Putnam.

Eastern Churches

The Greek Orthodox Church is a group of 11 churches comprising 140,000,000 members, united to each other by the same faith and governed by shepherds who go back successively as far as the apostles.

As a result of the Balkan Wars and World War I, the oecumenical patriarchate of Constantinople had lost most of its dioceses. Confined in Constantinople under the oppressive measures of the Turkish government, it struggled hard to keep its oecumenical prestige in regard to the other orthodox churches and the Christian churches. In 1944 the Bulgarian church, which had been in schism since 1872, asked and obtained from the oecumenical patriarchate its independence and autocephaly, a fact which contributed much to the pre-eminence of the patriarchate of Constantinople as the head of all the Orthodox churches. It succeeded even during World War II in keeping its friendly relations with the churches of the west and participating in the various conferences on faith, life and work. Its relations, especially with the Anglican church, attained such a degree of intimacy as to be called "brotherly."

The patriarchate of Alexandria paid much attention to its internal reorganization and extension towards Central and South Africa, as well as to the education of its clergy according to the modern problems with which it had to deal. The patriarchate of Antioch, free from many of the trials of war, but living in a country where many denominations

continued to struggle for supremacy, was fighting to keep its place. The training of the clergy met with many difficulties owing to scarcity of means. The patriarchate of Jerusalem, being the custodian of the holy places on behalf of the Orthodox Church in Palestine, had to fight hard against the contending parties in the new attempts to deprive it of the superiority it possessed in the administration of the holy places from the very beginning. The church of Cyprus, which in 1934 lost its archbishop and one of its metropolitans, up to 1946 had not achieved the election of a new archbishop.

The most important change took place in the great Orthodox Church of Russia. Because of the attitude taken after the revolution of 1917 towards religion generally and the Orthodox Church in Russia in particular, persecution by word and deed continued throughout the first ten years until the *locum tenens* of the patriarchal throne decided to recognize the new regime. Even after that recognition the persecution did not cease, but was confined to the spiritual means of atheistic propaganda. The first mitigation of persecution appeared after the publication of the Constitution of Stalin (1937) when religion was conditionally recognized and permitted. The teaching of religion in the schools continued to be forbidden; neither were parents allowed to look after the religious education of their children.

A sudden change in the conduct of the soviet government was noted after the German invasion of Russia. During the war years the Russian clergy with the *locum tenens*,

Alexei, patriarch of the Russian Orthodox Church (left), shown with Stephan I, exarch of the Bulgarian Church, during Alexei's visit to Sofia, Bulgaria, in the summer of 1946

Sergius, exhorted the Russian faithful to fight for their country and collected among them 200,000,000 roubles for the needs of war. This devotion of the Russian church to the nation moved the government to allow the election of a new patriarch in Russia and to give him, with his holy synod, permission to proceed to the organization of the Orthodox Church in Russia, which had been lacking from the time of the revolution. After this grant of freedom, many churches, which during the revolution had been turned to secular uses, were given back to their formal object. Theological academies and seminaries started to function again in the U.S.S.R., and religious magazines and ecclesiastical books were again published; a new religious life developed. During the election and enthronement of the successor of Sergius, the Patriarch Alexei, the soviet government seized the opportunity to show to the world its new spirit of tolerance.

The Orthodox Church in the Balkans, especially the church of Greece, suffered very much owing to the vicissitudes of war. After the occupation of Greece by the Germans and the Italians and the invasion of northern Greece by the Bulgarians, many churches were destroyed and the clergy pitilessly persecuted; the theological faculty and the theological colleges ceased to function. After liberation, the church of Greece applied itself strenuously to its reconstruction, but progress was very slow owing to the total collapse of the finances of the state and the impoverishment of the people, who largely contributed to the economic existence and prosperity of the church. The other Orthodox churches of Rumania, Yugoslavia and Bulgaria,

owing to the new regime, had to accommodate themselves and restrict their religious life in many ways. Religious teaching was abolished in the schools, ecclesiastical property was in danger of being confiscated and the clergy was forbidden to enter into communication with the other Orthodox churches or with the western churches and denominations. The Orthodox Church of Poland, consisting chiefly of Ukrainians, was literally decimated after the reunion of the Ukraine with soviet Russia. Of the 4,000,-000 Orthodox members before the annexation, there remained some 200,000 with a metropolitan in residence in Warsaw and one bishop. The small Orthodox Church of Albania, although it succeeded in obtaining its autocephaly from the oecumenical patriarchate of Constantinople, could not be optimistic about its future owing to the pressure of the Moslem-soviet government of Albania.

Eastman, Joseph Bartlett

Eastman (1882-1944), U.S. government official, was born June 26, 1882, in Katonah, N.Y. He was graduated from Amherst college in 1904 and studied law at Boston university. He was appointed to the Interstate Commerce commission by President Wilson in 1919 and was reappointed by succeeding presidents until 1933, when he served as federal co-ordinator of transportation. During his 14-year tenure on the ICC, Eastman fought to lower freight rates and executive salaries. He denounced unnecessary duplication of transportation services and sought to outlaw dummy corporations and holding companies. In 1936 he returned to the ICC and in Dec. 1941 was appointed director of the Office of Defense Transportation (ODT). Under Eastman's direction, the U.S. railways functioned smoothly during World War II and there was no repetition of the breakdown of World War I. Eastman died in Washington, D.C., March 15, 1944.

East Prussia

Formerly the easternmost province of the German land of Prussia, East Prussia had an area of 14,283 sq.mi. and a pop. (1939) of 2,496,017. East Prussia was separated from the remainder of the German reich after World War I by the Polish province of Pomorze, generally known as the Polish Corridor. According to the official figures of the Prussian census of 1910 the population in the southern part of East Prussia showed a strong Slav admixture, and in some districts in the southeast even a Slav majority. In 1919 the Poles based their claims for East Prussia on these considerations of nationality, and also upon considerations of strategy. A plebiscite arranged by the peace conference in 1919 in the nationally mixed districts decided in favour of Germany. Yet the strategic considerations in favour of Poland retained their validity, as was clearly shown when the German armies advancing from East Prussia precipitated Poland's defeat in 1939 and made Poland's access to the Baltic sea militarily untenable. For these reasons Poland claimed East Prussia during World War II. An additional reason was the socio-political character of the land; East Prussia was regarded as the centre of the economic and political power of the militaristic Junker class. In the period of the German republic (1918-33) the Junkers succeeded in maintaining their former position and even in increasing their hold upon Germany after the election of Field Marshal Paul von Hindenburg as president of the reich.

At the Berlin conference in 1945, the United States, the soviet union and Britain decided that Koenigsberg, the capital of East Prussia and an important port, and all the territory east and north of it were to be incorporated into the U.S.S.R., while the southern part of the province was put under Polish administration. The German inhabitants of East Prussia were to be transferred to Germany and to be replaced by Slav settlers. (H. Ko.)

Eberstadt, Ferdinand

Eberstadt (1890—), U.S. government official, banker and lawyer, was born June 19, 1890, in New York city. He graduated from Princeton in 1913 and took his law degree from Columbia university in 1917. He was associated with a Wall street investment house as a corporation lawyer and later was an investment banker until Jan. 1942, when he became chairman of the Army and Navy Munitions board. When this board was merged with the War Production board in September, Eberstadt was appointed vice-chairman of the latter, under Donald M. Nelson, in charge of synchronizing army and navy needs with production schedules. As the culmination of disputes within the board and between the army and the board, Eberstadt left in Feb. 1943.

Economics

The decade 1937-46 saw important advances in both theoretical and empirical economics. In the field of value theory, the basic postulates of the neoclassical system were critically examined and revised in important respects. Likewise, much creative speculation took place in the field of business cycle theory. Finally, the period was notably fruitful in empirical economics, where important progress was made in the development of new statistical tools and measurements, and particularly in relating empirical investigation to theoretical analysis.

There continued through this period the re-examination of value theory, begun in the early '30s with the publication of the works of Edward Chamberlin, Joan Robinson and Heinrich von Stackelberg on monopolistic and imperfect competition. Theoretically, while many minor refinements of the theory appeared, only one development appeared of possible real significance for future value theory—the attempt by Robert Triffin to effect a synthesis of the Marshallian partial equilibrium tradition of the Anglo-Saxon countries with the Walrasian general equilibrium system dominant on the continent. This was done by taking the concept of the differentiation of the prod-

uct of firms to the point where each firm was looked upon as a separate "industry." By thus doing away with the concept of the industry as a group of competing firms, and instead placing all firms in competition with one another with greater or lesser competitive gaps between firms, it was possible conceptually to relate all firms into one overall system.

The development of the theory of monopolistic competition gave an improved frame of reference for studies of monopolistic elements in the national economy. This was particularly evident in the extensive investigation into monopoly conducted by the Temporary National Economic committee, as well as in a number of private studies.

Within the field of value theory one other development, while not new, assumed increased importance. This was the revival, particularly by J. R. Hicks, of the indifference curve analysis, first introduced by Francis Edgeworth and Vilfredo Pareto but never extensively used until the decade 1937–46. Its theoretical significance lay in the fact that it claimed to do away with any dependence upon the concept of the measurability of utility characteristic of the traditional value theory. Analytically its major use had been in the rehabilitation of welfare economics, where it resulted in a considerable revival of interest in the related field of index numbers, and in the analysis of factoral combinations and multiple-product operations.

Perhaps in reaction to the depression of the 1930s, a major share of the attention of both theoretical and empirical economists was claimed by problems related directly to business cycles. The problem of unemployment had become perhaps the major practical and theoretical problem, just as the theories of value and distribution were for the classical period.

* * *

A MAJOR INFLUENCE in giving this problem its central position had been the appearance in 1936 of J. M. Keynes's General Theory of Employment Interest and Money. Its major significance for economics lay in the fact that it presented a new system for analyzing movements in aggregate income and employment. Taking unemployment as its central problem, the General Theory set forth a more complete and realistic system for analyzing the level of effective demand and the reasons for its fluctuation. It showed in theoretical form the possibility of an economic system which was in temporary equilibrium at less than full employment.

While many of the individual points of the General Theory could be traced to other authors, the publication of the new system was an event of first-rate importance in the advance of economic thought. It acted as a tremendous stimulus to the creative activity not only of those sympathetic to the Keynesian ideas but also to anti-Keynesians.

In the theoretical ferment following the publication of the General Theory, much effort went into the attempt to put business cycle analysis into dynamic terms. One aspect was a rapid development of the theory of uncertainty and expectations in the explanation of the level of investment. Another was the use of time sequence and period analysis of the movements from one position to another. Mathematical economists in particular were concerned with dynamic business cycle analysis and made important contributions.

The General Theory and the theoretical systems based upon it were not accepted without criticism. Objections came primarily under two related headings. First, it was held that certain of the relationships postulated as stable by the Keynesians, particularly that wages are inflexible

downward and that there is a consistent relationship between consumption and income, were not borne out in fact. Secondly, it was urged that the aggregative Keynesian analysis did not include enough variables to give a true picture of business cycle processes.

One other major contribution to the theory of economic change appeared during the decade, that of J. A. Schumpeter. Conceptually Schumpeter's work represented a major advance. Instead of taking the business cycle as an area apart, he placed it at the centre of the entire capitalist process and, bringing to a focus all phases of economic analysis, revealed the cycle as a legitimate and necessary characteristic of capitalism.

Starting from a system of static equilibrium, Schumpeter explained the business cycle by introducing the entrepreneur, defined as a person who initiates new products, methods and industries, as the dynamic force which initiates successive waves of economic progress and growth, to be followed by a readjustment toward a new equilibrium as the dynamic factors gradually become exhausted.

Empirical economics was probably emphasized more during the decade 1937–46 than in any previous era. It was particularly characterized by efforts to relate statistical studies to theoretical analysis. Because of the increased interest both of private groups and of the government, large numbers of new statistical series became available.

Especially significant were two new series of data relating directly to problems of business cycle measurement. One was the new census bureau series on the labour force, on unemployment and on the distribution of labour and employment among major segments of the economy. The second highly important series were estimates of national income and related series, carried on by the department of commerce.

Earlier work in these two areas had been done primarily by private organizations, and the fact that the government took over in this period indicated the increased importance placed upon the problem of fluctuations in employment and output. In terms of progress of economic thought, these and other important quantitative measurements helped meet a long-felt need for adequate concrete data to fit into the theoretical concepts which economists had developed.

Moreover, not only had theoretical concepts helped to mould the form in which the statistics were collected, but as better opportunity was provided to test hypotheses by facts, empirical economics in turn did much to influence the development and improvement of theory. An important illustration was the tendency previously mentioned to try to break up purely aggregative analysis of the Keynesian type into its components.

A noteworthy example of the trend toward relating theoretical and empirical analysis was Wassily Leontief's continuing studies which attempted to place in the framework of the general equilibrium theory an empirical study of the interrelations within the parts of the economy as evidenced by concurrent variations in statistical measurements of price, production, investment and income. This type of analysis contributed much to an understanding of the real interrelationships in the economy, and might ultimately provide a scientific basis for prediction of economic trends. The growing concern of the public and the government with these problems was again illustrated by the fact that this work was now being carried on by the government.

The central position taken by the problems connected

with business cycles was shown by the preoccupation of public policy pronouncements, both by private individuals and institutions and by the government, with questions relating to full employment and high levels of national income. The pronouncements of economists in the field of public policy primarily reflected their concern with the problem of maintaining an adequate level of investment both in the short-run cyclical period and in the long-run secular trend.

All schools of thought apparently agreed upon the strategic importance of investment and the necessity for finding sufficient outlets to absorb the nation's savings. In terms of policies needed to achieve a high level of investment two opposing positions could be distinguished.

One major point of view was that of the so-called stagnationist school. They foresaw a long-run lack of investment outlets in the private sector of the economy caused by factors not subject to control by methods suitable to a democratic capitalistic economy. These included such points as the decline of the rate of increase in population, the disappearance of the extensive frontier, a tendency toward capital saving investment, internal financing by industry and the possibility that saving would prove to be larger than intended investment. Moreover, because of this long-run lack of investment outlets, it was expected that short-term cyclical fluctuations in employment and income would be more severe, with relatively short periods of high activity and long periods of decline.

Suggested remedies varied widely. However, it may be said that all tended to place major reliance on an increased expenditure by the government, particularly government investment, to take up the slack expected in investment in the private sector. Concomitantly they tended to emphasize both the productivity of public investment and the lack of burden of the public debt. This latter position, which aroused much controversy, was supported first on the basis that the interest on internally held public debt amounted merely to a transfer of incomes and did not therefore involve a burden on balance.

Secondly, it was held that because of the expected tendency of national income to rise, partly because of government investment, any burden from the increasing interest charge would be lessened, depending upon the relative rates of increase.

The opposing groups denied the validity of the reasons advanced by the stagnationists, on the basis that such trends had been in existence during previous periods of high investment, or that the stagnationists had misinterpreted their data. The oppositionists tended to feel that any tendency toward long-run stagnation was due to institutional factors within human control. They cited the possibility of altering arrangements in such fields as monetary policy, the control of monopoly, tax reform and international trade and investment. Therefore, their policy recommendations were concerned with removing or alleviating institutional obstacles to high rates of investment

Two major areas of reform could be taken as typical of the manner in which these groups wished to improve investment outlets. One was by a reform of the tax system in a direction which the proponents felt would make a more favourable milieu for investment. All of these schemes had in common the desire to lighten the load of taxation upon investment return so that prospective profit might appear higher to the investor. Details of the schemes tended to vary, depending upon what factors in

the tax structure were believed most oppressive to investment. Generally, however, such schemes included heavier rates of personal taxation at low income levels coupled with the elimination of most excise taxes except those for sumptuary purposes; lower rates on high income levels; reduction of the corporation income tax rate; and a method of combining the corporation income tax and the personal income tax so that double taxation of dividend income would be eliminated.

The other example occurred in the field of international trade and investment. It was felt that enormous potential outlets for the sale of commodities and for investment existed abroad, but that under existing institutional arrangements the potentials were not likely to be realized. Policy recommendations were directed primarily toward such problems as stabilizing and freeing exchanges, encouraging capital movements on an economic basis, reducing government barriers to trade, controlling international cartels, and finding satisfactory methods of carrying on trade between free and controlled economies.

It was too early to tell at the end of the decade whether the war had any appreciable permanent effect upon the progress and direction of economic thought. It brought forth much discussion of such problems as price control, rationing and inflation. Likewise, much consideration was given to the form postwar problems might take, and to methods of alleviating expected maladjustments. However, the procedures used in analyzing these problems grew directly out of prewar modes of thought. The major influence apparently was in changing the areas of application and emphasis without causing any immediate direct break in the direction of economic thought.

This is not to say, however, that the large experience gained by economists and others with various economic processes, coupled with the enormous amount of empirical material gathered in the course of the war, might not have very important effects on the future progress of economic thinking.

It was probable that the war had accelerated to an even greater degree than in the past the tendency to link empirical and theoretical work with mutual advantage to the progress of each and to the progress of economics as a whole.

Ecuador

Ecuador is a west-coast republic of South America, astride the equator, from which it is named. It is bounded on the north by Colombia, on the east and south by Peru and on the west by the Pacific ocean. Area: 104,510 sq.mi. (including the Galápagos Islands, or Archipiélago de Colón, a dependency in the Pacific, with an area of 3,029 sq.mi.). Pop. (1944 est.), 3,171,367. No national census had ever been taken; earlier pop. ests. were: 1941, 3,011,062;

Four homeless Ecuadorian children victimized by the earthquake that brought death and destruction to inhabitants of the area southeast of Quito during Aug. 1938

1942, 3,085,871. Racial distribution is estimated at 60% or more pure Indian, 25 to 30% mestizo and at most 15% white; there are a few Negroes on the coast. Density of population for the whole country by a 1944 official estimate was 30.35 per sq.mi. The capital is Quito (pop., 1944 est., 165,924); other important cities, with 1944 pop. ests.: Guayaquil, the principal port (172,948); Cuenca (52,519); Riobamba (27,459); Jipijapa (22,097); Vinces (21,860); Chone (21,834); Ambato (21,692); Loja (20,776) and Latacunga (20,357). Presidents during the decade 1937-46 included Federico Páez, 1935-Oct. 24, 1937; Alberto Enríquez, Oct. 24, 1937-Aug. 10, 1938; Manuel María Borrero, Aug. 10, 1938-Dec. 1, 1938; Aurelio Mosquera Narváez, Dec. 2, 1938-Nov. 17, 1939; Carlos Arroyo del Río, Nov. 17, 1939-Dec. 11, 1939; Andrés Córdova, Dec. 11, 1939-Sept. 1, 1940; Carlos Arroyo del Río, Sept. 1, 1940-May 28, 1944; José María Velasco Ibarra, after May 28, 1944.

Disorder by Tradition.-Ecuadorian development during the decade was a continuation of the country's history of almost chronic disorder. Ecuador had attempted an extensive program of reforms under the government of a junta headed by Federico Páez which came into power in 1935. The budget for 1937 was the largest in many years, with heavy expenditures for national defense, public education, and public works and communications. The government made especial efforts to advertise the country and to attract tourists. A constituent assembly met on Aug. 10, 1937, to consider needed amendments to the constitution of 1906. This assembly formally named Páez as provisional president of the country and began consideration of constitutional changes. The government in the meantime sternly suppressed adverse criticism, closed opposition newspapers and refused to allow political exiles to return to the country. As internal unrest continued, Pres. Páez was compelled to resign on Oct. 24; he was succeeded by War Minister Alberto Enríquez. Pres. Enríquez promptly dissolved the constituent assembly and announced a formal investigation of governmental affairs and a proposed purge of those who had "abused power."

Political instability continued throughout 1938. A new constituent assembly met on Aug. 10 and accepted the resignation of Provisional Pres. Enriquez. The assembly chose as his successor Dr. Manuel María Borrero, but he proved unable to restore order and resigned amid political turmoil on Dec. 1. On the following day the assembly chose Dr. Aurelio Mosquera Narváez as constitutional president under a new constitution which it had approved a few hours before. Pres. Mosquera, however, was quickly thrown into conflict with the assembly in a dispute revolving around former Pres. Luis Larrea Alba, and on Dec. 14 he dissolved the assembly by force and called new elections. A part of the army led by Larrea thereupon attempted to overthrow the government of Mosquera, but the revolt was crushed after two days of fighting.

A major factor behind the political unrest, accentuated by the fact that no one political leader could command general support from the country, was popular dissatisfaction over the lack of progress toward settlement of the acute boundary dispute with Peru. This controversy, involving more than 100,000 sq.mi. of territory in the Oriente, or undeveloped provinces east of the Andes, was a long-lived quarrel but had become more serious. Negotiations with Peru had reached an impasse by June 1938, and as frequent minor clashes in the disputed areas continued, Ecuador on Oct. 10 appealed for mediation to the American republics which, in a three-year conference at Buenos Aires, had just effected a settlement in the historic Chaco boundary controversy between Paraguay and Bolivia; nothing came of the appeal, however. Because of strained relations with Peru, Ecuador at first indicated refusal to attend the eighth Pan-American conference at Lima, Peru, in Dec. 1938, but finally agreed to participate.

The constituent assembly enacted several laws during

1938 aimed at the betterment of the Indian population and its protection from exploitation, and at encouragement of co-operative farming. Nationalistic legislation directed against foreigners, and the somewhat idealistic laws for the protection of labour, caused serious disputes with foreign corporations during the year.

The government in Jan. and in March 1939 suppressed minor disturbances accompanied by strikes, which it attributed to leftist elements. Arrest of several prominent political and military figures in July thwarted a rumoured revolution. Moderate tension continued throughout the year. In the meantime, congressional elections were held on Jan. 15 under the constitution adopted the preceding month. Women voted in them for the first time in Ecuadorian history. The new congress met Feb. 2 and confirmed Dr. Mosquera Narváez in the presidency. Great indignation was prevalent throughout Ecuador in March 1939 when it was proposed in the U.S. congress that that country should purchase or lease the Galápagos Islands from Ecuador for use as a Pacific defense base for the Panama canal and to prevent their seizure by any foreign power. The Ecuadorian government in May formally and absolutely disavowed the proposal. Ecuador declared her neutrality when war broke out in Europe on Sept. 1, 1939, and, on Oct. 20, in accordance with the Declaration of Panama adopted at the first inter-American foreign ministers' conference for the creation of a safety belt around the hemisphere, the government proclaimed the neutrality of a zone extending 500 mi. west from its coasts and including the Galápagos archipelago. War conditions quickly resulted in serious economic disturbance in Ecuador, manifested chiefly by a sharp rise in retail prices, from 10% to 20%, and a decline in agricultural prices. Pres. Mosquera died on Nov. 17, 1939, and was succeeded as provisional president by Dr. Carlos Arroyo del Río, president of the senate. Arroyo del Río resigned on Dec. 11, however, to enter the electoral campaign for a succeeding term as constitutional president.

Arroyo was elected president on Jan. 11, 1940, in a warmly contested campaign in which the result was little in doubt, however, because of administration support of Arroyo. Partisans of Dr. José María Velasco Ibarra, a former president and an independent candidate in the campaign, refused to accept the official election verdict, and on Jan. 12 attempted a coup d'état, but Provisional Pres. Andrés Córdova was able to suppress the movement within a few hours. The government soon afterward expelled Velasco to Colombia. Further revolutionary plots occurred later in January, in March, and in July but were relatively easily suppressed by the government and Arroyo was enabled to take office on Sept. 1, 1940.

Moves Against Axis.-Ecuador strongly supported the program proposed and adopted at the second foreign ministers' conference at Havana, Cuba, in July 1940 for the provisional administration of European possessions in the New World in the event that another power (Germany) should attempt to assume possession or control of them. Totalitarian propaganda and fifth-column activities had become so considerable in Ecuador by mid-1940 that the government in June began a formal investigation. It subsequently eliminated two focal points of axis propaganda, an Italian military mission, which was replaced by one from the U.S., and the economically unprofitable Germancontrolled S.E.D.T.A. air line. German employees were ousted from the latter, with support by the U.S. state department, and supplanted with Ecuadorian and U.S. personnel. Popular protests over the presence of several

Japanese "oil explorers" near Esmeraldas, a coastal port in northern Ecuador, led the government to expel them in June. Initiative in the movement to eliminate propagandists and fifth-column activities was taken by a senate committee headed by Sen. Filemón Borja.

Border incidents in 1941 led to a Peruvian invasion of southern Ecuadorian provinces in mid-year; withdrawal was accomplished only after some international pressure and much alleged destruction of property by Peruvian forces. The development greatly embittered the feelings between the two countries. Political disorders were frequent during the year and were intensified by the boundary dispute; many observers telt that only divisions among his opponents permitted Pres. Arroyo del Río to remain in power through the year. The delicate political balance prevented acceptance of a proposed border agreement with Peru or the conclusion of any agreement with the United States for construction of a naval or air base on the strategic Galápagos Islands, lest the domestic opposition be given political ammunition. The situation played into the hands, of course, of pro-axis propagandists, who were very active throughout the year. A German diplomatic attaché was expelled for abuse of his prerogatives. After soviet entry into the war in mid-year, nazi agents became active in propaganda work among conservative, strongly Roman Catholic elements. Feeling against Japan was very strong, however, especially after the rumour became widespread that Japan was extending military aid to Peru, where a large Japanese minority was located. After formal entry by the United States into World War II, Ecuador granted that country rights of a nonbelligerent and interned a number of Japanese nationals.

Ecuador had an especial interest in the third foreign ministers' conference, held at Rio de Janeiro in Jan. 1942, because of the opportunity thus presented for settlement of its boundary controversy with Peru. Ecuador threatened a partial disruption of the conference by refusing to participate until the question was admitted to the agenda. Peru finally consented to this action and throughout the sessions of the conference, although the boundary controversy had no official place on the program, leading delegates, including Sumner Welles of the United States, attempted to find a solution of the dispute. It was finally announced, just before adjournment of the conference, that the long-standing quarrel had been settled and the boundary marked out in general. Ecuador lost a major part of the Amazonian Oriente which it had previously claimed, but it was territory settled primarily by Peruvians. With technical assistance from the United States, Brazil and other interested American republics, a joint boundary commission began work in mid-1942 on the actual surveying of the line on the ground; this work was incomplete at the end of 1946. Opponents of the administration made much political capital of the popular dissatisfaction with the settlement, and in May 1942 a threatened revolt led to the arrest of several of the most disaffected In spite of the delicate political balance, Pres. Arroyo del Río led his administration in a policy of wholehearted collaboration with the United States in the war effort. The rubber crop was assigned to the United States by treaty in July and in September the government leased to that nation air and naval base sites on both the mainland and the Galápagos Islands. Pres. Arroyo del Río visited Washington, D.C., in Nov. 1942 and subsequently announced the creation of an Ecuadorian Development corporation, which, with a capital of \$10,000,000 loaned by the United States, would develop Ecuadorian agricultural and industrial resources; the corporation was designed as an affiliate

of the Inter-American Development commission.

Ecuadorian co-operation in the inter-American war effort continued without substantial change in 1943. The government on March 26 prohibited subsequent publication of news on hemisphere defense or local military developments. All communication with axis countries was ended in May, and property of axis nationals was taken over by the government. The executive placed all vessels of more than 20 tons under national control. The government concluded arrangements on Feb. 23 by which the United States was to buy all Ecuadorian quinine available for export. The United States in June extended a \$5,000,000 stabilization fund agreement for an added year. Extraordinary powers which the congress had earlier granted to the president because of world conditions were in November continued in force until Aug. 1944. The government in the same month prohibited exports of platinum.

Internal politics during the year was marked by preparations for the 1944 presidential election. At least six candidates were reported in the field as early as May 1943, one of them being former Pres. Velasco Ibarra, who had been in exile much of the time in previous years. Several Liberal party candidates for the congress were arrested in February on a charge of political conspiracy. The government easily suppressed a minor revolt in August. Conditions in the economic field generally improved through the year, although a flour shortage occurred in May. The cost of living continued to increase, and was estimated in 1943 to be more than 50% higher than in 1939. Price control proved, on the whole, ineffective. The United States promised late in May, after the visit of Vice-President Henry Wallace, to send urgently needed locomotives and other railway equipment, and, in conjunction with United States experts, a comprehensive social and sanitary improvement program was outlined. The United States expended considerable amounts on defense construction at Salinas, at the tip of the peninsula between the Guayas river and the ocean, and in the Galápagos Islands; this resulted in a temporary increase in employment. The available labour supply was further absorbed by added demands for balsa and rubber, in addition to the usual agricultural employment. Several, but not all, important subsistence and export crops were estimated to be in larger supply than in the previous year, although with regard to exports the lack of shipping continued to be a handicap. The government on Oct. 6 established a national bank of provincial development, with a capital of 100,000,000 sucres, for the purpose of furthering the agricultural program and other projects.

May Revolution.—The climax of developments in 1944 was the revolution late in May, shortly before the scheduled presidential elections, followed by the new government's consolidation of its position. The presidential campaign, which had begun even before the middle of 1943, revolved around the effort of the administration party (the Liberal Radical) to continue in power. That party on Feb. 16, 1944, nominated Miguel Angel Albornoz, 70-year-old president of the senate, as its candidate. The chief opposition candidate was Dr. Velasco Ibarra, supported by the Democratic Alliance, a coalition of groups opposing the administration. Velasco Ibarra, who was still in exile, set up headquarters in southern Colombia and from there maintained close touch with the Ecuadorian political situation. As the election, scheduled for June 10, approached, political tension increased. Riots broke out at Guayaquil, frequent centre of revolutionary movements, on May 20, and on May 26 the government closed all university classes until after the election. The expected uprising came on

Ecuadorian workers removing bark from a balsa tree trunk

May 28; Arroyo del Río and his cabinet promptly resigned and later went into exile in Colombia; Albornoz withdrew as a candidate. A junta took charge until the arrival of Velasco Ibarra in triumph on May 30. He assumed the provisional presidency the following day and was confirmed as constitutional president on Aug. 10.

The new regime made many changes in administrative and diplomatic positions in the following weeks. Diplomatic recognition came quickly; 22 foreign states had extended it by June 15. Pres. Velasco Ibarra on June 1 announced plans for a constituent assembly to draft a new basic law and make other changes. Elections on July 23 resulted in a clear majority for the pro-administration Democratic Alliance; the party composition was 32 Socialists, 28 Liberals, 25 Conservatives, 8 Communists and 3 independents. The assembly met during the remainder of 1944 as both a constituent and a legislative body. It questioned, but did not repudiate, the 1942 boundary adjustment with Peru; it did, however, take punitive steps against the Ecuadorian officials who had negotiated it. The assembly on Aug. 17 appointed a committee to study the position of the United States naval rights in the Galápagos Islands and on Dec. 29 the assembly advised the president that a new naval base agreement with the United States, for a 99-year lease, was inadvisable. The assembly on Nov. 8 approved a resolution for establishment of relations with the U.S.S.R. In domestic matters, the government, by decree of June 15, assumed administrative control of the national railway system. It also took tentative steps during

1944 to establish a national merchant marine. The government purchased the entire 1944 sugar crop.

The chief development of 1945 was the adoption of a new constitution, dated March 5, and approved by the constituent assembly after several months of deliberation. The new constitution made some important changes in the governmental system. The unitary form was continued, with a president directly elected for a four-year term and ineligible for the immediately succeeding term, but a unicameral congress was established, chosen in part on an elaborate basis of functional representation. Several novel features included representation in various bodies by the "political trends" of the right, centre and left. The bill of rights was elaborate and reflected a high degree of governmental regulation.

Senator Kenneth McKellar's renewal of the proposal that the United States buy or lease the Galápagos Islands for a naval base led to sharp criticism from members of the Ecuadorian constituent assembly. Lt. Gen. G. H. Brett and Rear Adm. H. G. Kingman conferred in Quito March 15 with the president and foreign minister regarding postwar use of Galápagos bases. A report circulated in mid-September that a preliminary agreement had been reached for United States use of the Galápagos in return for an Export-Import bank loan of \$20,000,000. The foreign office announced Feb. 3 that Ecuador had considered itself at war with Japan from Dec. 7, 1941. Ecuador signed the United Nations pact Feb. 14 at Washington, D.C. The foreign office on Feb. 15 announced agreement with Peru

over the last differences affecting their mutual boundary controversy; five months later the presidents of the two countries exchanged cordial felicitations. The soviet chargé d'affaires in Mexico announced on June 28 that diplomatic relations between his country and Ecuador had been established.

More Plots.-Domestic politics continued disturbed in 1945. Pres. Velasco threatened in late February to resign unless certain changes were made in the then pending constitution; he later declared his disapproval of the constitution and absented himself from Quito when it was promulgated. The president refused to accept a collective cabinet resignation March 11 and again on July 30. An alleged attempt at revolt by army officers was suppressed Aug. 3. The government granted amnesty on Aug. 14 to various members of former administrations. An executive decree in April authorized a contract for establishment of a domestic telecommunications system. A presidential decree on June 9 reduced import duties on automobiles, trucks, busses and tires by 75% in an effort to relieve the acute transportation problem. Quito began construction during the year of a modern water-purification system to cost \$1,000,000. Ecuador had its first experience with woman suffrage in municipal elections, which reflected a conservative trend, on Nov. 25, 1945.

Chronically turbulent political conditions continued in 1946. The government suppressed a revolutionary plot on March 30; the crisis was accompanied by many arrests and the suspension of constitutional guarantees. Soon afterward the 1945 constitution was suspended and the government announced elections for May 26 for a new constitu-

ent assembly and congressional elections for June 30. Final returns for the constituent assembly indicated choice of 33 Conservatives, 20 dissident Liberals, 6 independents, 2 dissident leftists and 1 Democrat; Liberals, Socialists and Communists abstained from voting. Three prominent political leaders were arrested July 31 for alleged subversive plotting. The constituent assembly met Aug. 10, although an easily suppressed revolt the same day by 60 armed civilians tried to prevent its meeting. Velasco at once submitted his resignation as president, but the conservativedominated assembly on Aug. 11 rejected it by a vote of 43 to 10, with leftist and centre parties refusing to vote, and reinstated him until 1948. The assembly on Aug. 18 ended all political and military sanctions imposed after the 1944 revolution. The government on Jan. 6 signed a treaty of amity with China. Early in 1946, Ecuador proposed creation of a permanent conciliation commission for the American republics. The United States on Feb. 1 transferred its airfield at Salinas to Ecuadorian authorities and on June 30 the military bases in the Galápagos were evacuated.

Eden, (Robert) Anthony

Eden (1897—), British statesman, was born June 12, 1897, and was educated at Eton and at Christ church, Oxford. After service in World War I from 1915 to 1919, he contested the Spennymoor division of Durham in 1922, and in the following year he was elected for Warwick and Leamington, which he thereafter continued to represent. He was lord privy seal and a privy councillor in 1934, and the following year entered the cabinet as minister without portfolio for League of Nations affairs, holding this post until the following December, when he became foreign minister. Disagreement with Prime Minister Chamberlain over the latter's policy of "appeasing" Germany and Italy led to Eden's resignation on Feb. 20, 1938.

Upon the outbreak of war on Sept. 3, 1939, he reentered Chamberlain's cabinet as dominions secretary, and on Dec. 23, 1940, he was appointed to the foreign ministry in Winston Churchill's cabinet.

Eden was active in the negotiations culminating in the important British-U.S.S.R. pact in July 1941. He participated in a number of international conferences, among which were the parleys with Stalin at Moscow and Tehran in 1943, and the Crimea, San Francisco and Potsdam conferences in 1945. At Potsdam he yielded his place as foreign secretary to Ernest Bevin, following the victory of the Labour party in the elections of July 1945. When Winston Churchill visited the U.S. in Jan. 1946, Eden led the Conservative party opposition in the house, attacking particularly the Labour government's acts of nationalization.

Edinburgh

The year 1937 saw Edinburgh, city, royal burgh, and capital of Scotland, peacefully engaged in its industries of printing, bookbinding, brewing, distilling and biscuitmaking; its streets were thronged with tourists attracted by the city's rich historical associations, its fine buildings and monuments and its picturesque position on the shores of

the Forth. In that year occurred one of the most colourful scenes Edinburgh had witnessed, when the king and queen paid their coronation visit to the city, and, on their way to take up residence at the palace of Holyroodhouse, drove along Prince's street under banners presented by, and bearing the coats of arms of, the burghs of Scotland.

Not predominantly an industrial city, Edinburgh had not suffered so acutely as more highly industrialized areas during the years of trade depression. With the outbreak of World War II, however, the city devoted itself to the production of war supplies, and soon its newly erected or hastily re-adapted factories were turning out a steady stream of war materials. Edinburgh had its first taste of actual warfare on Oct. 16, 1939, when, in the first raid on Great Britain, German bombers carried out a daring daylight attack on warships in the Firth of Forth. Its position on the Forth made the city particularly interested in naval activity, and the port of Leith played its full part in the country's war effort. One of the most memorable events at the port was the arrival in Feb. 1940 of H.M.S. "Cossack" after its epic voyage to a Norwegian fjord, where it had rescued British seamen from the German prison ship "Altmark."

The city still attracted a large number of visitors in wartime and was called upon to represent Scotland to the Allied forces. It played a leading part in the formation of street-savings groups, and its record showed that the city was second to none in war savings; the total subscribed from the start of the savings campaign to the end of World War II in May 1945 was $\pounds_{11}6,000,000$.

The civilian population in Edinburgh in 1937 was 466,800. In June 1946 it was 463,100, but since many citizens had not yet returned from the services the figure was not representative. (J. I. F.)

Edison, Charles

Edison (1890-), U.S. secretary of the navy from 1939 to 1940, was born at Llewellyn Park, West Orange, N.J. on Aug. 3, 1890, the son of Thomas A. Edison. He was educated at Massachusetts Institute of Technology and in 1913 joined his father in business and research. He served as assistant secretary of the navy from Nov. 17, 1936, as acting secretary upon the death of Claude A. Swanson July 7, 1939, and as secretary from Dec. 30, 1939 to June 24, 1940, when he resigned to become the successful candidate for the governorship of New Jersey. Although a Democrat, he was a political opponent of Mayor Frank Hague of Jersey City, and after the end of his three-year term in 1944 he succeeded, despite the vigorous opposition of Hague, in having the state constitution revised.

Education

Great social crises have always exercised a profound influence upon the development of education. The ten years 1937-46, years of economic depression followed by war, were marked in the United States by widespread unrest and unsettlement in education on the one hand, and on the other by extensive analyses, surveys and discussions of plans for the improvement of education in all its aspects. While there were serious setbacks and dislocations, preparations were made for the readjustments which the domestic and the world crises revealed to be essential. The country could take pride in the fact that the average edu-

cation of the personnel in the armed forces had risen in the period between the two wars from six grades of elementary school to two years of high school, but grave concern was caused by the educational and physical deficiencies of large numbers examined by the Selective Service. These deficiencies, however, objectified, in a way that could be understood by all, the existence of serious inequalities in the provision of educational opportunities throughout the country and brought home the fact that education should be viewed as a national concern and that the maintenance of satisfactory minimum standards could be assured only if local, state and federal resources were pooled. The recognition that the federal government must participate in the support of education demanded a clearer statement of policy to define the relations between federal and state authorities in the administration and provision of education.

This issue was precipitated by apparent encroachments of the federal government in educational affairs necessitated as emergency measures during the depression.

The ten critical years were marked by setbacks which were inevitable. Enrolments in elementary schools declined as a result of the declining birth rate. Secondary school enrolments fluctuated with opportunities for employment and directed attention to the problems of youth and the urgency of changes in the curriculum to meet the needs of all U.S. youth. Colleges and universities were affected by uncertainties from year to year about enrolments and their financial future, and were challenged to redefine their aims. New types of education were introduced—nursery schools to take care of preschool children as a social welfare measure during the depression and during the war to provide for their care while their mothers were engaged in war industries; the Civilian Conservation corps (CCC) and National Youth administration (NYA) to provide for unemployed youth; and a variety of projects in education under the Work Projects administration (WPA) to meet the needs of unemployed adults.

In the first of the ten years under discussion, Harvard university celebrated its tercentenary anniversary, notable not only as an event in the history of U.S. education but because of the reaffirmation of the national ideal in education. The ideal was clearly defined by President Roosevelt on this occasion: "Love of liberty and freedom of thought is a most admirable attribute of Harvard. But it is not an exclusive possession of Harvard or of any other university in America. . . . In the name of the American nation I venture to ask you to cherish its traditions and to fulfill its highest opportunities."

It was understood throughout the country that this reaffirmation of the democratic ideal was an answer to the challenge of foreign ideologies. Nor was it ignored; education for democracy became one of the chief preoccupations of educators. The Educational Policies commission, established in 1935 by the National Education association for a five-year period but continued throughout the decade under discussion, devoted the major part of its publications to a clarification of the aims and purposes of education in U.S. democracy-The Unique Function of Education in American Democracy (1937); The Purposes of Education in American Democracy (1938); Education and Economic Well-Being in American Democracy (1940); and The Education of Free Men in American Democracy (1941). In 1939 a Congress on Education for Democracy, convened by Teachers college, Columbia university, New York, N.Y., was attended by delegates from national organizations representing business, industry, labour, agriculture, voters, advertisers and other activities and representatives from foreign countries. The keynote for this congress was again sounded by President Roosevelt, who in a message wrote: "Education for democracy cannot merely be taken for granted. What goes on in the schools every hour of the day, on the playground and in the classroom, whether reflecting methods of control by the teacher, or opportunities for self-expression by the pupils, must be checked against the fact that the children are growing up to live in a democracy. That the schools make worthy citizens is the most important responsibility placed upon them." The proceedings of the congress were published under the title Education for Democracy (New York, 1939).

Education for democracy had always been the aim of U.S. education; the crises of the ten years 1937-46 focused attention on the urgency of needed reforms in curriculum and methods of instruction. In the years preceding the depression the emphasis, based on the theory of progressive education, had been on the freedom of the individual and at the extreme on a type of laissez-faire education without much attention being given to the development of a sense of social duty and responsibility. (See I. L. Kandel, The Cult of Uncertainty, New York, 1943). While the contributions of progressive education were not ignored, it began to be recognized that social values and social understanding must be given their rightful place in education. If the aims of education for citizenship in a democracy were to be realized, the educative process must develop in the future citizens an understanding of civic, social and economic affairs and a sense of responsibility for co-operating with their fellow citizens. In the discussions of the new adjustments and reforms needed in education, a shift took place from the cult of individualism to an emphasis on the school in the community, radiating from the community to the nation and from the nation to the world. (See Department of Supervision and Curriculum of the National Education Association, Toward a New Curriculum, Extending the Educational Opportunity of Children, Youth, and Adults, Washington, D.C., 1944; and Department of Elementary School Principals, Community Living and Elementary Education, Washington, D.C., 1944). The Progressive Education association changed its name in 1944 to the American Education Fellowship.

The strains and tensions caused by the depression crisis produced another problem for educators who realized that the interracial and interreligious conflicts were obstacles to the successful achievement of the democratic ideal and the great U.S. experiment. Started in Springfield, Mass., and followed in other school systems, a movement was launched to promote intercultural education which was later sponsored by several national organizations. (See S. G. Cole, J. Quillen and M. J. Wiese, Charting Intercultural Education, Stanford, Cal., 1946; H. Taba and W. Van Til, eds., Democratic Human Relations, Washington, D.C., 1945; and J. W. Wise, Springfield Plan, New York, 1945.)

Whether from the point of view of democratic ideals or of intercultural relations, a new emphasis began to be placed upon values. A movement to associate schools with religious instruction had begun before the depression in the form of weekday schools or of released time. In May 1944 a conference was called by the American Council on Education with the co-operation of the National Conference of Christians and Jews to discuss the issues raised in discussions of religion and public education. That a need was felt for incorporating religious values in education was agreed upon at the conference; it was also clear that the introduction of sectarian religious education in public schools would be contrary to the U.S. tradition. (See American Council on Education Studies, Religion and Public Education, Washington, D.C., 1945; and C. H. Moehlman, School and Church, the American Way, New York, 1944.) The problem was discussed from another point of view in the seventh yearbook of the John Dewey society, The Public Schools and Spiritual Values (New York, 1944). The volume aimed to establish the broadest possible area of agreement between "secularists" and the "supernaturalists." From still another angle the problem of values entered discussions of the place of the humanities in a liberal education, particularly at college level.

These were some of the general issues discussed in the decade 1937-46. More time had to elapse before they

could be woven into a general pattern. The more immediate problems which emerged during the period and which occupied the major part of the attention of all concerned with education are presented in the following pages. A summary of the outstanding changes which pressed for attention at the close of World War II was presented in a pamphlet of the Educational Policies commission, National Education association, *Proposals for Public Education in Postwar America* (Washington, D.C., 1944):

(1) Wider application of the principle that an acceptable minimum of educational opportunity should be available to every individual regardless of his status. (2) General improvement of programs to develop physical and mental health. (3) Greater emphasis upon intelligent self-direction in study and learning. (4) Increased opportunity for learning how to do, particularly through work experience in vocational programs. (5) Increased opportunity for learning and practicing the ways of democratic group living. (6) More systematic adap-

Impressions of war in the drawing of a student at New York university's Clinic for the Social Adjustment of the Gifted Child, in 1942

tation of teaching methods, content, and length of schooling to individual and social needs. (7) Broader cultural background and greater technical knowledge and skill on the part of all professional staff members. (8) Reorganization and enlargement of local school districts and the integration of state educational facilities in the interest of efficient and economical school programs. (9) General acceptance of the principle that public education should receive its financial support from all levels of government, state and national.

Equality of Educational Opportunity.-The U.S. people had always nurtured a deep-rooted and abiding faith in education. In his "Farewell Address," George Washington urged his fellow citizens to establish institutions for the dissemination of learning as a primary concern. The faith in education was re-enforced by the ideal of providing equality of educational opportunities for all. Despite the provision of educational facilities unparalleled in any other country, serious concern began to be shown during and after World War I as to whether adequate provisions were being made throughout the country to insure equality of educational opportunity. During the depression and World War II the most persistent problem discussed centred on this subject. In the depression years many communities were unable for financial reasons to keep their schools open at all or were able to keep them open only for a curtailed school year. Large numbers of teachers joined the ranks of the unemployed, while the salaries of those retained in service were considerably reduced. Expenditures for education declined everywhere, and capital expenditures for new buildings or for repairs were reduced to a minimum.

More revealing than the disruption of educational services during the depression were the facts discovered by Selective Service, which rejected some 5,000,000 young men for military service on account of physical, mental and educational deficiencies; more than 1 in every 3 examined was rejected. Of the registrants in the 2 registrations before Pearl Harbor, 347,038 made their mark on the registration cards because they could not write their names. Many others were found whose reading ability was so poor that they were unable to read orders, signboards, regulations and instructions; they were, in the phrase that became current, "functionally illiterate." In the words of the Director of Selective Service, "With great pressure on our manpower resources, it is regrettable that we lose so many physically qualified, who must be rejected because of illiteracy." Other shortcomings were also discovered; for example, inadequate preparation among officer candidates in mathematics and an inadequate number of men with a mastery of foreign languages. These shortcomings did not arise from failure to provide opportunities for education, but they did reflect certain trends in education at the high school and college levels.

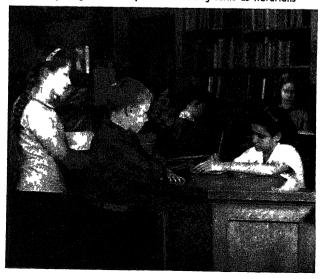

As a consequence of the striking facts about the status of education revealed during the depression and war years, a number of detailed studies were made which destroyed the general assumption that the ideal of equality of educational opportunity was universally put into practice throughout the country. On Sept. 19, 1936, President Roosevelt appointed an Advisory Committee on Education for the purpose of making a study of the experience under the existing program of federal aid for vocational education. On April 19, 1937, the president requested the committee to give more extended consideration to the whole subject of federal relationship to state and local conduct of education. Under the enlarged terms of reference the committee investigated the status of education in all its

aspects and the needs that had to be met. The committee transmitted a comprehensive report early in 1938. The general conclusions of the committee, as presented in a summary of its report published under the title *The Federal Government and Education* were as follows:

The public school system in the United States greatly needs improvement. Glaring inequalities characterize educational opportunities throughout the Nation. The education that can be provided at present in many localities is below the minimum necessary to preserve democratic institutions. Federal aid is the only way in which the difficulties in this widespread and complex situation can be corrected.

The committee pointed out in detail the nature and causes of the inequalities found in every aspect of education: the amount expended per pupil in average attendance; teachers' salaries; length of school term; number of pupils of high school age enrolled in high schools; value of school property; expenditure on school equipment and instructional materials; provision of health and welfare services; and expenditure per classroom unit. Inequalities existed not only among states but within each state, and between urban and rural communities. One of the chief causes of the inequalities was the manner of financial support based on a property tax and the fact that the financially poorer states and communities had a larger number of children per 1,000 of their populations than the wealthier states, which resulted in the poorer states making greater effort and ranking higher in the percentage of income devoted to education than the wealthier states and yet unable to provide even a satisfactory minimum of educational facilities. The amount and quality of education which children and youth could enjoy were dependent not only on the economic condition of their parents but also on their place of residence. In a large measure, too, the reason for the prevailing inequalities was to be found in the traditional system of local administration of education which resulted in the existence, at the time when the report was made, of 127,000 independent areas of school administration, ranging from the district with a single-teacher school and a small number of children of all ages to an area as large as New York city. The number of school districts was reduced to 115,000 by 1946, but without any serious effect on the situation. Because of the migration and mobility of the U.S. people, education had become a national concern. Education had to be

Junior high school students at Winnetka, Ill., being initiated into library usage with many of them taking turns as librarians

recognized as the bulwark of democracy and as an agency to equalize the condition of men and reduce class, race and sectional distinctions. In concluding its discussion of inequality of educational opportunity the committee stated that:

If for a long period of years, each succeeding generation is drawn in disproportionately large numbers from those areas in which economic conditions are poorest, if the population reserves of the Nation continue to be recruited from economically underprivileged groups, and if the inability of the depressed economic areas and groups to provide proper education for their children is not corrected by aid from areas and groups more prosperous, the effect on American civilization and on representative political institutions may be disastrous.

The Advisory Committee on Education supported its discussion of inequality of educational opportunity by factual data based on statistics of 1935–36. The same statistical approach to the problem of providing an adequate system of education was made in a pamphlet on Federal Aid for Education: A Review of Pertinent Facts, issued by the National Education association in 1942. In a report entitled Unfinished Business in American Education: An Inventory of Public School Expenditures in the United States, issued jointly by the National Education association and the American Council on Education in 1946, Professors John K. Norton and Eugene S. Lawler also presented a factual and objective picture of education and the problems to be met.

The census of 1940 showed that 2,000,000 adults had never attended any kind of school; 10,000,000 adults, not confined to the financially poorer states, had had so little education as to be virtually illiterate; 3,000,000 children between the ages of 6 and 17 were not in school because of ignorance of parents and poor enforcement of compulsory attendance laws. According to Selective Service, of the 17,000,000 men examined in the draft, 5,000,000 were rejected for educational, mental and physical deficiencies. Education in the United States was provided in school buildings ranging from one-room shacks taught by relatively unprepared teachers to spacious buildings with the finest equipment and instructional materials and taught by competent teachers. In 1939-40 the best financed school systems spent \$6,000 or more per classroom unit per year on salaries, books, equipment and maintenance; 19,-497 children enjoyed the advantage of schools at this level. The poorest school systems, attended by 38,283 children, spent less than \$100 per classroom unit. In the same year 1,401,605 children attended schools in which the cost per classroom unit was \$4,000 per year, while 1,175,996 children were in schools where the unit cost was less than \$500 per year. For the country as a whole the median cost per classroom unit per year was \$1,600. The greatest need existed in areas where the largest numbers of children were found and where the cost per unit was low. Thus, while the ratio of the number of children of school age per 1,000 of the population was 226 for the country as a whole, it was 296 in South Carolina, 193 in New York and 178 in California.

The variations in per capita income in the states were even greater—\$960 in Nevada and \$195 in Mississippi, which in terms of income per child to be educated amounted to \$5,140 in Nevada and \$693 in Mississippi. The poorer states had, therefore, to devote greater effort to the provision of funds for the support of education than the wealthier. The ten states with the lowest expenditures allotted a larger percentage of their incomes to education than the ten states with the highest expenditures. Yet in spite of this the states low in income had low expendi-

tures for education; Mississippi ranked ninth in order of percentage of income devoted to education (3.41%) but the median expenditure for education was only \$400 per classroom unit, while New York, which devoted 2.61% of income to education, spent \$4,100 per classroom unit. In the dual system states the median expenditure per classroom unit for white children was \$1,186 as compared with \$477 for Negro children.

That inequalities in education affected children not only in low-income states but also in rural areas all over the country had long been known. The problem of rural education came to the fore with the migration of families in search of work during the depression. It was recognized more than ever before that the quality of education given in rural schools would in the long run affect the quality of citizenship in the urban areas to which the rural population migrated, as well as in the nation as a whole. At a White House Conference on Rural Education held in Oct. 1944 "A Charter of Education for Rural Children" was drawn up. The conference pledged itself to the achievement of the following educational rights for every rural child: a satisfactory, modern elementary and secondary education; an educational program to bridge the gap between home and school and between school and adult life; health services, educational and vocational guidance, library facilities, recreational activities, and where needed, school lunches and transportation facilities at public expense; teachers, supervisors and administrators familiar with rural life; educational service and guidance during the entire year and full-time attendance at a school open for not less than 9 months in each year for 12 years; a satisfactory, modern school building; participation through the school in community life and culture; a local school system sufficiently strong to provide all the services required for a modern education; and the use of the tax resources of the community, state and nation to guarantee a U.S. standard of educational opportunity.

The campaign to correct inequalities in education had for a long time been conducted mainly by educators. A powerful ally was found in the U.S. Chamber of Commerce, which in 1945 published the report of its Committee on Education, Education, An Investment in People. After presenting statistics showing the existence of widespread inequalities, the report illustrated the relation between education and income by the fact that 50% of those who attended college or went beyond, 39% of those who attended high school or graduated, and 11% of those who had 8 years of schooling reached the \$5,000 bracket. A somewhat similar distribution was found in the relation between rent paid or rental value of owned homes. Finally, data were presented showing that the volume of economic activity in the various states rose or fell with the level of educational expenditure and the median years of completed education in such matters as per capita retail sales, number of telephones per 1,000 of the population and circulation of national magazines. A close relation was also indicated between the rate of educational deficiencies as shown by Selective Service and current expenses for education. The committee concluded that education had become an essential instrument in the expansion of the nation's dynamic economy.

Evidence was accumulated during the decade 1937-46 that young people could not for financial reasons avail themselves of such opportunities as existed. This fact had already been brought out by George S. Counts in his study of *The Selective Character of Secondary Education* (1922);

it had been confirmed by a number of other studies. The National Survey of Secondary Education (Washington, D.C., 1932) had shown that 31% of the high school students left school for economic reasons. In Maryland, Howard M. Bell found that the percentage was 52% (Youth Tell Their Story, 1938); the Regents' Inquiry in New York state reported in 1939 that the most important cause for leaving high school was financial; in a study of Parental Income and College Opportunities (1940) Helen B. Goetsch found that of 1,023 high school graduates in Milwaukee, Wis., able to profit from college education only 35% were in full-time attendance in some college and that there was a close relationship not only between the amount of fulltime education but also between the choice of professional careers and parental incomes. In Kentucky H. L. Davis, in a study of the Utilization of Potential College Ability in the June, 1940, Graduates of Kentucky High Schools (1942), found that for economic reasons about half of the best college risks failed to go to college, while about one in seven of the poor college risks did continue from high school to college. Finally, the whole subject was fully discussed from every angle by W. Lloyd Warner, Robert J. Havighurst and Martin B. Loeb in Who Shall Be Educated: The Challenge of Unequal Opportunities (1944). The solution by the award of scholarships or other subsidies to poor but able youth was advocated by President James B. Conant in "Education for a Classless Society" (Atlantic Monthly) and in the report on Education and Economic Well-Being in American Democracy of the Educational Policies commission of the National Education association (1940).

Federal Aid.—It was generally agreed that inequalities could be removed only by federal participation in the support of education. The movement for federal aid had begun during World War I; it continued throughout the decade 1937–46, and bills were introduced in congress almost annually after the initiation of the proposal, but without success. One reason for this failure was general ignorance of the fact that the history of federal activities in education could be traced back almost to the founding of the republic.

The temporary dislocation of the nation's educational system during the years of the depression and the pressing need of trained civilian manpower inevitably led to increased financial aid from the federal government and to the assumption of extensive educational functions by almost every department of government. This development was particularly marked in connection with the emergency programs which began to be undertaken in 1933.

Funds amounting to a total of about \$22,000,000 were provided to keep schools open in many areas. The Federal Emergency Administration of Public Works (PWA) made grants for the construction and repair of educational buildings which up to 1937 amounted to a total of \$263,-000,000, supplemented by loans of \$83,000,000. Under the Works Progress (later Work Projects) administration (WPA), \$250,000,000 was spent for the repair of old buildings and the construction of new buildings for educational and community recreational activities. The same administration under its emergency education program hired some 44,000 unemployed teachers to give various types of part-time education which enrolled more than 1,700,000 persons. In the schools books were repaired, libraries maintained and lunches provided in addition to numerous other useful activities. A notable contribution was also made by WPA in the support given for the establishment of nearly 1,500 nursery schools during the depression years and an increasing number during World War II to take care of children of working mothers in defense areas.

In 1934 a program of student aid was begun under the Works Progress administration and transferred in 1935 to the National Youth administration (NYA). Aid was given under this program to students who otherwise could not remain in high school or college in return for part-time employment in the school or on the campus or on work of value to the community. The appropriations to NYA rose from \$35,517,000 in 1935 to \$157,159,000 in 1941 and dropped to \$151,760,000 in 1942. A year before the student aid program was adopted the Civilian Conservation corps (CCC) was established as a form of work relief which combined work with other forms of educational experiences at the elementary, secondary and even college levels. At the same time the older activities of the federal government in education were continued with increased grants for instruction and research in land-grant colleges, for agricultural and home economics extension work in rural areas and for vocational education and vocational rehabilitation.

World War II imposed new responsibilities, the major burden for which was assumed by the federal government, to promote education for defense. In addition to the training of army and navy personnel in colleges, an extensive program for the training of workers in industry and agriculture was undertaken in 1940 under the direction of the U.S. office of education and continued until June 1945. During this period provision was made for the training of 12,000,000 men and women in high schools, special courses, colleges and universities. Of this number, 1,500,000 men and women were trained in colleges and universities, some under the Engineering, Science and Management War Training programs (ESMWT), some in special courses, others in co-operation with industrial concerns. Training for industry was provided for 8,000,000 students in 2,500 schools and for food production for 2,500,000 in 15,000 farm communities. Under the Lanham act, 1941-45, child care centres were established for children of mothers engaged in war industries. Funds were also provided by the federal government for maternal and child health, for welfare services for dependent and delinquent children and for medical care for crippled and handicapped chil-

For the fiscal year ended on June 30, 1942, the federal government provided \$286,401,164.35, of which \$55,711,-247.17 came under regular funds and \$230,689,917.18 under emergency funds provided for the crises created by the depression and the war. Of the emergency funds, \$15,-878,189.42 was allotted for defense training in colleges, \$99,704,280.21 for defense training in secondary schools and \$54,294,597.00 to provide educational facilities for war work areas. Other funds were appropriated by the federal government for international cultural relations conducted by the Office of the Coordinator of Inter-American Affairs and the Division of Cultural Relations of the department of state. It was estimated in 1944 that the educational expenditures of federal bureaus and agencies amounted to a total of \$1,500,000,000, more than half of the total expenditures (about \$2,500,000,000) for elementary, secondary and college education provided by local, state and federal agencies.

Despite the fact that the federal government during the depression and the years of World War II embarked on an extensive educational program in addition to the continuing program of supporting education, proposals for the development of a policy of federal aid to correct the

glaring inequalities in the provision of educational opportunity continued to meet with resistance. The opposition came in the main from groups which insisted on the tradition of states' rights and feared that federal aid might be followed by federal control in education. It became clear during the depression and war years that the appropriation of federal funds for education was not based on any clear policy concerning the relations which should exist between federal and state governments. While some of the funds were channelled through the state and local educational agencies to be administered by them under federal supervision of a general nature, others were administered directly by federal bureaus and agencies.

The crisis came to a head in 1941 with mounting criticism of the tendency on the part of federal agencies to administer directly the educational services provided under the programs for the Civilian Conservation corps and the National Youth administration. In a bulletin, The Civilian Conservation Corps, the National Youth Administration, and the Public Schools, published by the Educational Policies commission of the National Education association in 1941, two questions were raised: should the federal government operate and control educational programs to meet needs which affected the national welfare and which could be met by the unaided powers of the states? Or should they be met by the federal government by working through the state and local educational systems? These issues were raised by the operation and control through the CCC and the NYA of nation-wide programs of education for unemployed youth, separate from the state and local educational systems. Three principles were recommended by the Educational Policies commission to govern the relations between federal, state and local agencies: (1) to give leadership to promote concerted nation-wide action; (2) to supply financial aid in order to equalize opportunities in established services of education, to establish new services and to aid needy students; and (3) in times of unemployment, to provide employment on public works programs for youths who, having completed their vocational education, could not be placed in regular jobs. The commission recommended that the CCC and the NYA should be discontinued as separate youth agencies and that their functions should be transferred to state and local educational agencies. The federal government should meet needs which affected national welfare, cut across the bounds of states and were beyond the unaided powers of the states to meet. The government should not itself operate and control educational programs, but should work through the state and local systems and strengthen these agencies by supplying leadership and financial aid without control. As a consequence of the mounting criticism, and also because of the entrance of the country into World War II, which demanded other methods for training youth, the CCC was discontinued in 1942 and the NYA in 1943.

The movement for federal aid for education, as already pointed out, was strengthened by the light which had been thrown on the inequalities in education. It became increasingly apparent that the major issue was the relationship of the federal government to the states, when and if aid was approved by congress. The Advisory Committee on Education, in its report to President Roosevelt, stressed the values of the U.S. tradition of local controls in government and especially in education. Efficiency might be secured by centralization of control but at the price of suitable adaptation to local needs. One of the great values of local freedom was the assurance of experimentation, healthy rivalry between localities and popular interest in education. The preservation of local control over education remained one

aspect of the preservation of U.S. democracy. If federal aid were provided, however, there should be a limited amount of control to insure honesty, legality and efficiency in the expenditure of funds. Safeguards could be established without bringing the federal government into the local management of schools. The use of federal aid to exercise control over the content and process of education would be resisted as incompatible with the maintenance of local initiative and responsibility. The committee recommended the application of these principles to any new laws to provide federal aid and the amendment of existing laws to conform with these principles. Control over courses of study should be avoided and the duty of determining the character of education, whether general or vocational, should be left to the states.

In a bulletin published in 1945 by the Educational Policies commission of the National Education association on Federal-State Relations in Education, attention was again directed to the inequalities in education which existed throughout the nation. Federal aid had increased but on a piecemeal or hit-or-miss basis. The federal government played an important role in education, but the pattern and directions of federal action in education were indefinite and chaotic. Education should be looked upon as an integrated whole directed to producing competent citizens for a democracy, but its administration, organization, content and process should result from the co-operation of all concerned. Federal participation was essential since education was a national as well as a local interest, but federal action should be restricted to supplementing and assisting local administrative authorities. The federal government should (1) supply financial assistance and control the expenditure of funds by way of audit and adequate reports to insure their use for the purpose for which they are granted, and (2) provide leadership through research, investigation, co-operation, reports and recommendations for the development of education.

The commission found not only an absence of policy to govern federal-state relations, but considerable overlapping of functions between the many federal bureaus which had something to do with education. Grants when made should be for general rather than special purposes in order to encourage the development of balanced programs of education and to avoid over-emphasis on particular aspects. The main purpose of general grants should be to establish a national minimum of financial support for public education in the states, and the funds should be distributed on an objective basis such as the number of children and youth attending school and the fiscal capacity of each state. The commission was of the opinion that the matching of funds by the states was undesirable since such a practice would favour the richest states and would again result in unbalanced educational programs.

The number of agencies concerned with education in the federal government, the commission recommended, should be reduced, and only those in which educational activities constituted an integral part of their functions should be retained. To co-ordinate their work an interdepartmental committee should be created, but more important than this, in the opinion of the commission, was the need of a more effective federal office of education to exercise leadership, to serve as the agency of the federal government in dealing with the states, to conduct investigations and research, to collect and publish statistical and factual information concerning education and new educational enterprises and procedures and to conduct con-

ferences of lay and professional leaders in education for the consideration of matters of educational policy and procedure of national interest. The commission further recommended the creation of a national educational commission or board of from 12 to 15 outstanding citizens appointed by the president to serve as a general advisory body on education.

The prospects of federal legislation of federal aid appeared to be brighter in 1946 than at any other time during the preceding ten years. This was due to the formation of a bipartisan group which met in Washington on Nov. 15, 1945, on call of Congressman Robert Ramspeck (Georgia) to sponsor house of representatives bill 1296, for which H.R. 4929 was later substituted. As a consequence of this meeting a Committee for the Support of Federal Aid for Public Schools was formed. Even more encouraging to the advocates of federal aid were the remarks of Sen. Robert A. Taft (Ohio), chairman of the Republican steering committee, who on Aug. 4, 1945, proposed on behalf of the committee that the legislative agenda for congress, following the summer recess, should include: (1) "A bill to extend federal aid to assist the states to develop a comprehensive health program through public and private agencies ... and establish medical inspection and physical education in our schools," and (2) "A bill to provide federal aid to enable the poorer states to provide a minimum of education for every child." The Democratic platform, adopted at the Chicago convention in 1944, included a plank favouring "federal aid to education administered by the states without interference by the federal government." In his annual message to congress on Jan. 21, 1946, President Truman repeated the proposal which he had made in his budget message the previous year, "that the federal government provide financial aid to assist the states in assuring more nearly equal opportunities for a good education," since inequality among the states would still continue even though higher incomes might be expected than before World War II. He also recommended grants to meet current arrears in the construction of educational facilities, and ended his message with the statement that:

The federal government has not sought, and will not seek, to dominate education in the states. It should continue its historic role of leadership and advice and, for the purpose of equalizing educational opportunities, it should extend further financial support to the cause of education in areas where this is desirable.

It was significant that the later bills to provide federal aid for education contained specific provisions to prohibit the exercise of any direction, supervision or control over or prescription of any requirements with respect to any school or any state educational institution or agency to which funds would be made available. This provision was contained in an amendment to senate bill 181, proposed on March 27, 1946, by Sen. Lister Hill of Alabama (for himself, Sen. Elbert D. Thomas of Utah and Sen. Taft). The bill authorized appropriations "for the purpose of more nearly equalizing public elementary school and public secondary school opportunities among and within the States," beginning for the fiscal year ending June 1947 with the sum of \$150,000,000 and rising for the fiscal year ending June 1949 and for each fiscal year thereafter to \$250,000,000. The apportionment was to be based on the number of children between 5 and 17 and the fiscal capacity of each state, with a definite provision of \$40 for each child to be educated and with special advantages for the

Children of the Redlands public schools in California being trained to work together through constructional activities

poorer states. The bill carefully safeguarded the educational interests of minority races in those states which maintained dual systems of education. The funds would be administered in each state by the education authority which was given the responsibility of auditing local expenditures and submitting annual reports to the U.S. commissioner of education. The companion bill to S. 181 in the house of representatives was H.R. 4929.

In 1943 the National Resources Planning board drafted proposals for a postwar program for education to include education for health and safety, vocational training, education for leisure, home and family living, national security and citizenship, social and economic education, the retraining of men and women demobilized from the armed forces and defense industries and the provision of opportunities for those whose education had been interrupted by the war. The cost of this program would be \$6,100,000,-000, including expenditures for the following purposes: \$3,000,000,000 for preschool, elementary and secondary schools; \$400,000,000 for junior colleges; \$1,000,000,000 for colleges, universities, professional and technical institutions; \$300,000,000 for adult education; \$300,000,000 for student aid; and \$200,000,000 for public libraries. In addition, the board recommended an expenditure of \$2,380,000,000 to eliminate building deficiencies for these aspects of education. The total cost of the proposed program would be slightly more than twice as much as the total expenditures for education by all public agencies in 1940-\$2,817,000,000.

Status and Salaries of Teachers.-The U.S. public had

never extended its faith in education to an adequate recognition of the importance of the status of teachers or of the necessity of providing salaries commensurate with that faith. It was from this failure that many of the difficulties in maintaining adequate standards in education arose during the depression and war years. One serious effect of the depression was the closing of many schools, particularly in rural and village areas. A sense of patriotic duty when the United States entered World War II impelled many teachers to leave the profession either for service in the armed forces or for work in war industries, despite repeated statements by the War Manpower commission and the director of Selective Service that teaching was an essential occupation. It was estimated that 300,000 teachers left the profession, of whom 100,000 joined the armed services.

The mounting shortage of teachers caused the gravest concern during the war. The shortage of teachers was accompanied by great reductions in the number of students entering and graduating from teachers colleges and normal schools. In 1943-44, only 5,000 students were graduated from these institutions as compared with 10,000 graduates a year in normal times. The shortage not only affected schools in rural and small communities, but dislocated the work of high schools everywhere by the entrance into the armed services and war industries of teachers of such subjects as mathematics, physics, chemistry, physical education and vocational training. Married women who had left the teaching profession were recalled, and in a number of states emergency certificates were granted to inexperienced young people after a brief period of training. In 1943-44 such certificates were granted to 69,423 teachers as compared with 2,305 before Pearl Harbor. In the same school year there was a turnover of 189,000 teachers in contrast to 95,000 a year in normal times, and in 1944-45 the number of teachers new to their jobs was 168,000, the large majority in rural schools. It was estimated that as a result of the teacher shortage, the granting of emergency certificates and the rapid turnover, perhaps 500,000 children of school age received no education and an almost equal number were given an education below acceptable standards. Serious efforts were made by national and state organizations to attract recruits into the teaching profession, but with little success until the veterans began to

Although the standards of preparation for elementary school teachers rose from two to three or four years beyond high school graduation, and from four to five years for high school teachers, salaries were not increased to correspond to these requirements. The average salary of teachers was at least \$500 less than average earnings in industry in 1944-45. During the decade 1937-46 there was an increase in the average salary of teachers, supervisors and principals, but it did not keep up with the increase in the cost of living. The average salary in 1935-36 was \$1,283, a decrease from the average of \$1,417 in 1931-32; in 1939-40 the average rose to \$1,441, in 1942-43 to \$1,599 and in 1943-44 to \$1,755 (estimated). While the earnings of industrial workers increased 56% from 1940 to 1943, teachers' salaries increased only 11%. The estimated average salary of \$1,786 in 1944-45 would buy only what \$1,350 would have bought in 1940.

The range of average salaries in 1944-45 indicated the inequalities found in the 48 states. Four states (Arkansas, Georgia, Mississippi and South Carolina) paid less than \$1,000 a year; 27 states less than \$1,500; in 11 states the average salary was more than \$2,000; and in only 2 states was the average above \$2,500-\$2,616 in California and \$2,726 in New York.

The decade brought to light more clearly than in any other period the widespread inequalities in education generally; they also directed attention to the absence of any recognized norms in the requirements for the appointment of teachers. In 1939 there was created under the American Council on Education a Committee on Teacher Examinations with which the superintendents of the largest and best organized school systems co-operated. While it was hoped that the examinations might become national in scope, there was no intention of encroaching on the autonomy of local education authorities in the selection of their teachers. The committee hoped to reduce the great variety of standards and to establish national norms for appraising the qualifications of teachers. It was recognized that the tests to be administered by the committee were not the sole or even the most important basis for the selection of teachers but that they could be used to supplement other requirements. Examinations prepared by the Cooperative Test service were first given in 1940 and continued to be given during the war, but to gradually diminishing numbers of candidates. The total battery included two groups of tests: (1) in English, general culture, professional subjects and contemporary affairs for all candidates; and (2) special tests for elementary and secondary

In 1939 the American Council on Education appointed the Commission on Teacher Education for a five-year term to serve as a clearinghouse of information on successful practices and promising experiments in the education of teachers. The commission conducted conferences and organized workshops for consultation and exchange of information, and encouraged and evaluated experiments in preservice and in-service education of teachers. Experiments were initiated with a variety of programs in this area in 20 nationally representative institutions (teachers colleges and liberal arts colleges) and in 14 representative school systems. The commission, whose work was directed by Dr. Karl W. Bigelow, issued a number of pamphlets and books. The final statement, which presented a summary and analysis of the commission's experience, was published under the title The Improvement of Teacher Education in 1946.

Public school teachers on strike for higher wages at St. Paul, Minn., in 1945, enjoying hot food brought by some of their students. Low salaries, lagging far behind the wartime rise in industrial wages and the cost of living, contributed to a dangerous shortage of teachers in U.S. schools during and after World War II

Secondary Education.-In no branch of education did greater uncertainty and unrest prevail during the decade than at the secondary level. The problems represented the accumulation of difficulties which had begun to manifest themselves at the beginning of the century. An education devoted primarily, but in U.S. history not wholly, to preparation for college entrance and based on an academic curriculum became the object of criticism and attack with the rapid increase in the number of boys and girls in the high schools for whom the academic subjects appeared to be unsuitable. The enrolments in public high schools rose from 2,494,676 in 1920 to 4,799,867 in 1930; by 1935 they had increased to 5,974,537 and 5 years later to the highest figure ever reached thus far-7,113,282. By 1942-43 the enrolments had dropped by nearly 1,000,000 to 6,122,066, partly because of war conditions and partly because of the reduced birth rate in preceding years.

The curriculum was broadened but mainly by the addition of new subjects more practical in character and without a general and integrated reorganization of the program. The social and economic changes which took place in the period between the two world wars, the increasing unemployability and unemployment of youth, the growing intercultural conflicts, the challenge to democracy from alien ideologies during the critical years of the depression, the shortage of teachers and the demands of the war years tended to focus attention on education and particularly on secondary education. The NYA brought out the importance of providing aid to students if they were to be enabled to continue their education, while both the NYA and the CCC experiments emphasized the value of work experience in the preparation of youth for adult life.

From another point of view the demands of the war revealed certain defects in the results of high school and college education. Difficulties were encountered in recruiting military or civilian personnel with an adequate mastery of the languages which were included in the curriculum of both high schools and colleges. Before the entrance of the country into the war Adm. Chester W. Nimitz drew attention to the fact that, owing to the lack of candidates for the naval officers' training corps and for commissions who were suitably prepared in mathematics, the passing mark in the examinations had to be lowered. Finally, the results of a test on U.S. history given by the New York Times to 7,000 students in 36 colleges and universities indicated that there was not only a lack of knowledge but widespread misinformation about the subject. Although considerable controversy was aroused about the validity of the test, there were many who showed concern about the results of the investigation. One member of the senate committee on education and labour proposed that federal aid should be provided to promote the study of U.S. history in schools and colleges, while the senate ordered the survey published as a senate document. Several states -Illinois and New Jersey, for example-enacted laws requiring the teaching of U.S. history in all publicly-supported institutions or for a specific number of years in high schools. The American Historical association, the Mississippi Historical association and the National Council for the Social Studies appointed a committee to investigate the whole question of the teaching of history in schools and colleges. The committee reported that the subject was widely taught, but a larger number of more competent and better prepared teachers was needed.

The criticisms of the work of the high schools from the point of view of the organization of subject matter

were, however, either discounted or ignored, and the trend was set in another direction. In 1940 the American Youth commission appointed a special committee to report on needed changes in the curriculum of secondary schools. The committee in its' report, What the High Schools Ought to Teach, published later in the same year, based its recommendations on the change in the character of the high school population, the different social origins and occupational interests of the students, the need of a program to meet the interests of the large majority and the fact that only a minority would continue education beyond the high school. It pointed out that a great many pupils in high schools had reading ability of the fifth- or even the fourth-grade level, that many who were slow learners lacked either interest in subjects found in the prevalent programs or proper motivation for study. The committee concluded that the high school curriculum was generally inappropriate, that the conventional subjects-English, mathematics, natural sciences and foreign languages-needed to be re-examined, with less emphasis on the traditionally academic, and better adaptation to the interests and abilities of the students. It was recommended that the program of secondary education should concentrate on English, social studies and work experience.

This report was followed in 1944 by a more extensive report on Education for All American Youth, prepared and published by the Educational Policies commission of the National Education association. Purporting to be a description of secondary education as it might be conceived to be in 1964, the report was based on the assumption that the prewar pattern of education was "shattered beyond repair," that "the end of the war was the end of an epoch to which there could be no return in education or in any other aspect of life," and that the tremendous pressure of the traditional educational program stood in the way of reform. The types of programs that should be developed to meet the needs of all U.S. youth were illustrated by accounts of two hypothetical experiments-one in a rural and one in an urban high school in courses extended by two years to include community institutes or junior colleges as a normal part of the reorganized system of education. The traditional arrangement of the program by subjects would be replaced by "curriculum areas." Thus, in the urban high school the curriculum areas would consist of "common learnings" ("to help students grow in competence as citizens of the community and the nation; in understanding of economic processes and of their roles as producers and consumers; in co-operative living in family, school and community; in appreciation of literature and the arts; and in the use of the English language"); health and physical education; science, emphasizing methods, principles and facts needed by all students; vocational preparation including also preparation for college entrance; and the development of individual interests-avocational, cultural or intellectual. Corresponding programs would be developed for rural high schools. The conventional subjects would appear in the new courses insofar as they would be needed to meet the common needs of youth, but they would be found "in unaccustomed settings" among the "common learnings."

The Educational Policies commission sought in these recommendations to establish two objectives: (1) to counter the trend of the previous quarter of a century to expand the program of studies to such a degree that it became unwieldy and educationally meaningless; and (2) to provide a common education for all youth so that they might acquire a common store of reference as future citizens, in the interests of a common democratic goal. Planning for

American Youth, published by the National Association of Secondary School Principals to stimulate improvements in the high school program, was based on the recommendations of the Educational Policies commission's report.

The trend to increasing enrolments in high schools, caused by the serious reduction in employment opportunities during the depression years, was reversed in the years immediately preceding and during World War II. The shortage of manpower, the attraction of high wages and a sense of patriotic duty to contribute to the war effort led to the withdrawal of students from high schools, while the demand for skilled or semi-skilled workers turned students in the schools away from the academic subjects to vocational training. This tendency was encouraged by the U.S. office of education through the distribution of funds appropriated for the promotion and development of courses in vocational training of all kinds, of different lengths of duration and at different levels, and through its overemphasis on practical work in the High School Victory Corps, whose creation it sponsored. A greater inducement was provided, however, by the high wages offered to youth with little or no training or with opportunities for training on the job. The exodus of young people from school both on reaching the normal limit of compulsory attendance and before became so serious that a nationwide "Go to School Drive" was launched in 1943 by the U.S. office of education, the War Manpower commission, the children's bureau of the department of labour, state and local education authorities, professional organizations and voluntary groups like the National Congress of Parents and Teachers. It was estimated that at least 3,000,000 boys and girls between the ages of 14 and 18 left school without completing their secondary education. The enrolment of 6,714,000 in 1940-41 dropped to 5,760,000 in 1943-44. The situation was recognized as serious as much from the point of view of national interest as that of individual well-being. The "Go to School Drive" urged youth to take advantage of educational opportunities as a preparation for citizenship and for service to the nation. All interested groups were pressed to recognize the obligation to safeguard the physical and intellectual development of youth. The Educational Policies commission stated that high school attendance until graduation was the best contribution to the war effort which school-age youth could make. It was generally agreed that part-time work in war occupations should be combined with regular schooling until graduation. The ultimate effects of the exodus from school were expected to be most serious since large numbers would be inadequately prepared for life and, without training, might be forced into the ranks of the unemployed in the postwar years.

The major issues were clear but there was some concern lest the need of providing curricula and courses suited to the abilities and aptitudes of those students who had academic interests might be ignored. The question of the relation of the secondary school curriculum for such students to the proposed reorganization of college courses was not considered. The results of the eight-year experiment undertaken by the Progressive Education association in 1930 and published in five volumes seemed to indicate that students with the necessary ability could succeed in college no matter what subjects they had studied in high schools. (See W. Aikin, The Story of the Eight-Year Study: Conclusions and Recommendations, 1942.)

Adjustment of Youth.—The early years of the depression had focused attention on the problems of the educational and social adjustment of youth which continued to occupy an important place in all discussions of educa-

tional reconstruction through both the depression and World War II. It remained, in fact, one of the crucial issues in the postwar years. Approached first as a problem of the adjustment of youth, it began to be recognized as part of the whole problem of economic policy for the postwar years. Attention had been drawn to the situation by the thousands of youth who were roaming the country and becoming "young tramps" in the early '30s, by the rapidly increasing enrolments in the high schools without the adequate development of curricula adapted to the needs and interests of youth and by the millions of out-of-school youth who were not usefully employed. It was feared that the age group from 16 to 24 which constituted about onesixth of the total population might, if left without guidance and employment, become a menace to the nation and its democratic institutions through a sense of disappointment and frustration and a feeling of "not being wanted." The Advisory Committee on Education, appointed by President Roosevelt, in referring to this situation stated that "The great problem is one of facilitating the flow of young people from the schools into the various occupations among which they should be distributed as adults." The solution of the problem, insofar as youth were concerned, demanded suitable general education, guidance and counselling, vocational preparation and placement.

The major social agencies for the preparation of youth were, in the opinion of this committee, the high schools which should develop a greater variety of types of programs to meet the needs of those students who did not intend to go to college. In 1935-36 the enrolments in the fourth year of the high schools had ranged from 42% to 75% of the enrolments in the first year. While these figures indicated defects in the holding power of the high schools, the economic causes of elimination from school were not ignored. The committee favoured the development of a "core curriculum" to be combined with guidance and preparation for occupations. To meet the latter need, the committee recommended the organization of an occupational outlook service to provide the information needed to enable youth to make a choice of occupations and training. Such service would involve the co-operation of the federal and local governments, industry, labour, schools and colleges and public employment offices. The public high schools could not undertake to give a wide range of specialized training, since there were between 20,000 and 25,000 occupations. They could, however, provide training in basic skills and general knowledge useful to a variety of occupations as the basis for specialized training by industry. For this purpose the committee urged the revival of intensive apprentice training through cooperation between schools and industry and under careful safeguards.

Relief Agencies.—Civilian Conservation Corps.—The first measure to meet the needs of youth unemployed as a result of the depression was the establishment of the Civilian Conservation corps (q.v.) "for the relief of unemployment through the performance of useful work, and for other purposes." Provision was made for the selection of youths between 17 and 21 who were unemployed and in need of work and whose families were in need of relief. Each enrollee was paid \$30 a month, of which \$15 went to dependents, \$7 was retained in a savings fund and \$8 paid for current expenses. The average cost per enrollee was \$1,200 a year. In the nearly ten years of its existence (from 1933 to 1942) some 1,400 camps were established in different parts of the country and enrolled nearly 3,000,000

youth. As first conceived, the program of the CCC was intended to provide work relief and to conserve and develop natural resources. Before the end of the first year it was recognized that the agency could make an important contribution to the educational and social development of the enrollees. Large numbers were drawn from the underprivileged groups; 62% came from rural areas with inadequate school facilities; one-third had not completed elementary education and few had had any vocational training. The chief weakness of the CCC program was that its aims and functions had not been integrally planned from the start. Another defect arose from the fact that the administration of the camps was placed under army reserve officers who operated under war department regulations, while the staff included foremen and skilled workers responsible for the work projects and educational advisers who held subordinate positions and whose work was too often included as an afterthought. Physicians, dentists and chaplains gave part-time service in the camps. It was not until the CCC was assigned under the reorganization plan, 1939, to the Federal Security agency that a coordinated program was made possible along the lines of President Roosevelt's view that "its major purpose is to promote the welfare and further the training of the individuals who make up the Corps, important as may be the construction work which they carry on so successfully."

It was generally recognized that the contribution of the CCC was valuable, if only for the improvement of the health of the enrollees and the development of certain habits of living under camp conditions in communities of about 200 in each camp. The primary purpose of the agency—conservation and construction work—contributed to improvement in skill and efficiency. It was only by gradual stages that it began to be realized that the CCC could become an important agency for the fullest development of the enrollees in general education, health and physical fitness, and vocational preparation, as well as for education in citizenship. The camps themselves provided opportunities for vocational training which far exceeded the range required for conservation and construction work.

Civilian Conservation corps members trained to operate field radios during forest fires

When it was realized that the CCC as an agency contained the idea of a new type of educational institution, its primary purpose as a relief agency was dropped. There were, in fact, some who saw in the CCC a form of secondary education for youth who could not profit from the existing types. After the new concept of the possibilities of the CCC was realized, little time was left to put it into practice, since the agency was dropped in 1942. Nevertheless, much was learned from the experiment, especially the importance of work experience as a medium of education for certain groups of youth. Much was also learned which would have contributed to the improvement of its administration and to better adjustment of the enrollees to life after leaving the camps. The chief criticisms which may have led to the dropping of the CCC were centred not so much in its work as in the fact that the federal government had entered directly into the field of education and by-passed both the state and local education authorities.

National Youth Administration .- One of the causes of inequality of educational opportunity-inability of students to remain in school or college for economic reasons -had become more aggravated during the depression years. The first measure to provide relief in such cases had been begun in 1934 under the Federal Emergency Relief administration with appropriations of \$13,500,000 for the fiscal year 1934-35 for the purpose of giving aid to students between the ages of 16 and 24 who otherwise could not continue their education. In 1935 the National Youth administration (q.v.) was created as an autonomous agency under the Works Progress administration to administer such grants to students for "relief, work relief, and employment" while engaged in a regular program in high schools, colleges or universities. The amount of aid was limited to \$6 a month to high school students, \$15 to college students and \$25 a month to graduate students in return for work in the schools or colleges or work of value to the community which would otherwise not be done. The students so aided engaged in a great variety of activitiesclerical, maintenance and repair, research, adult education, community health work and co-operation with state and local agencies engaged in public health, recreation, education, libraries, museums, social work and agricultural extension. In 1939 the NYA was transferred under the reorganization plan to the Federal Security agency (q.v.) with an enlarged program, as defined by President Roosevelt, "to extend the educational opportunities of the youth of the country and to bring them through the processes of training into the possession of skills which enable them to find employment.... Work projects ... have been merely the process through which its major purpose was accomplished."

Under this definition of its functions, which amplified the language of the Emergency Appropriation act and authorized the NYA to use its funds to provide training as well as part-time work to needy young persons, a number of resident and local nonresident centres were established in which the students devoted half of their time to production or service projects and the maintenance of the centre, and half to attendance at classes. The NYA thus embarked on a program of vocational schools which, even though state and local teachers were employed, were federally administered and controlled. In 1940-41 the NYA received an appropriation of \$26,240,616, of which \$12,-509,161 was spent in aid to students in 28,000 public, parochial and private high schools, and \$13,731,455 in aid to college and university students; an additional sum of \$100,000 was appropriated to aid Negro students who, because of lack of facilities in their own states, were enrolled in colleges and universities of other states. Some 450,000 students were aided under this program.

The NYA, like the CCC, directed attention to the value of combining work experience and schooling. It also pointed to the need of co-ordinated efforts under national leadership to attack the problems of youth as a matter of national concern. Criticism of the NYA, like that of the CCC, was not concerned primarily with its program but with federal encroachment and the threat to the established principles of federal-state relations in the field of education. The value of the program was recognized, but it was strongly felt that the solution of the problem of youth adjustment should be undertaken by all agencies concerned—public and private, federal, state and local, and social and educational.

American Youth Commission.-In 1935 the American Council on Education in A Proposal for the Development of a Comprehensive Program for the Care and Education of American Youth, had called attention to the need for a nation-wide study of the problems of U.S. youth. It was recognized that these problems were not due wholly to the depression but resulted also from social and economic changes which antedated the crisis and were not merely temporary. To keep up with the tempo of modern life, educational programs had to be revised and educational institutions had to deal more adequately with the problems than they had done in the past. The conditions arose from increase of leisure time, growing specialization and mechanization of vocational opportunities, growing interdependence of communities and the need of greater understanding and sympathy between groups, the place of radio and motion pictures in determining interests, attitudes and standards of taste and conduct, the declining influence of the home and the church, the shifting of mores and of ethical standards and the apparent increase in crime. The council found neither a consistent plan for dealing with current problems nor an agency equipped to develop such a plan and put it into effect. A multiplicity of welfare agencies both public and private existed, but there was a lack of co-ordination for securing effective results.

The American Council on Education, with a grant of \$500,000 from the General Education board, organized the American Youth commission in Sept. 1935, consisting of 16 men and women with Newton D. Baker as chairman and Owen D. Young as vice-chairman. The general purposes of the commission were to consider the needs of youth between the ages of 12 and 25 and to develop a comprehensive program for their care and education; to investigate how the needs of youth were being met by existing agencies; to recommend the most effective programs for solving the problems of youth; and to popularize and promote desirable plans of action through conferences, publications and demonstrations of promising procedures.

The commission through its staff studied more than 300 national voluntary agencies working with young people, conducted surveys to discover the attitudes of youth on education, employment, recreation, war, wages, voting, relief, religion and group relations, investigated the literature on youth problems and conducted nearly 200 surveys of youth in different parts of the country. A flood of light was thrown on the situation by the Maryland Youth survey, the results of which were published in 1938 in Youth Tell Their Story. Other studies which emerged from the commission's investigation dealt with secondary education, occupational adjustment, federal support of education, education for family living, vocational and technical education and education in the CCC camps. Experiments

were conducted in guidance, placement and occupational adjustment of young workers; in some experiments the cooperation of schools, industry and social welfare groups was secured. Reports of the progress of the commission's work were published in a monthly Bulletin and the results of special investigations in a series of books of great value to all concerned with the problems of youth. The major publications were the following: Youth Work Programs; Youth, Family and Education; Guideposts for Rural Youth; Matching Youth and Jobs; Equal Educational Opportunity for Youth, A National Responsibility; Youth Tell Their Story; Color, Class and Personality; Growing Up in the Black Belt; Youth in the CCC.

A pamphlet published in 1939 under the title A Program for American Youth contained the recommendations of the American Youth commission and the American Council on Education. The fact was emphasized that the gap between the number of jobs for youth and the number who needed and wanted jobs could not be closed without aid from the federal government. Employment in some form of service under public auspices should be provided for young people more than 16 who did not desire to remain in school and could not secure jobs in private enterprise. Up to the age of 16 they should be required and enabled to attend full-time schools. The years between full-time school and full-time job should be bridged by part-time schooling and part-time employment, a device which experiments had proved to be successful. The educational aspect of public work for youth-superintended by competent leaders and planned to assist the worker in discovering his own aptitudes and abilities so that he could enter private employment in a field where he could be most useful and successful was emphasized.

The general report of the American Youth commission, Youth and the Future (1942), dealt with the whole range of youth problems as might be gathered from the following chapter headings: Youth unemployment as a continuing problem; experience with youth work programs; work programs for youth in the future; relations between schools and youth work programs; the problem of full employment; the needs of youth; education; occupational adjustment; the use of leisure time; marriage and the home; health and fitness; delinquency and youth care; citizenship; action in communities; action in state governments; the place of the federal government; responsibility for planning in relation to action; and the meaning of life.

Higher Education.—The crises of the decade 1937-46 seriously affected the status and progress of higher education in the United States. In 1936 there had been a slight increase over the previous year of 6% in the enrolments in colleges and universities and of 9% in junior colleges. This increase was maintained until the outbreak of World War II. A more serious problem than that of enrolments, however, was the reduction in the income from investments of endowments and in the number of gifts. The increased enrolments were due largely to the grant of student aid under the National Youth administration. The shrinkage of income meant, on the one hand, curtailment of staffs, particularly among the younger members, despite the larger number of graduate students and Ph.D.'s available, and on the other, made it impossible to increase salaries and in many institutions compelled a reduction. These conditions led to proposals for federal aid, without leading, however, to definite action.

The outbreak of the war in Europe had an immediate

effect on enrolments in institutions of higher education owing to uncertainty in the political situation, the increased opportunities for employment and expectation of the draft. Enrolments in 1940 were practically the same as in 1939; in 1941–42 there was a definite decrease of nearly 9% as compared with 1940–41; the heaviest losses took place in tax-supported institutions and in independent teachers colleges. The distribution of students in the various fields of study showed a marked difference; the medical schools had the largest enrolments on record and engineering schools and scientific departments generally were attended by larger numbers; law schools were the worst hit by reduction in enrolments.

In a report on the Effects of the War Upon Colleges, 1943-44, the U.S. office of education announced that in the fall of 1943 the total enrolments were 1,120,300 or 18% less than in 1939. There were twice as many women as men enrolled compared with two men to three women in 1939-40. The median age had dropped from 18 years 11 months in 1940 to 17 years 10 months owing to the accelerated programs and the admission of students from the junior high school year; the median age for women in 1943-44 was 18 years 4 months. Enrolments in graduate schools were 30% less than in normal schools.

In 1944 the committee on education of the house of representatives appointed a committee to study the effects of the war on higher education. The report of the study, conducted under the direction of Dr. Francis J. Brown, indicated the serious financial condition of colleges and universities caused by decreased enrolments and the discontinuance of the army and navy programs discussed below. The committee recommended federal aid of \$25,000,000 annually during the emergency, the grants to be made to institutions when their enrolments dropped to 60% of normal. The recommendations approved by the Association of American Colleges were incorporated in a bill, H.R. 3116, but no further legislative action followed.

The uncertainty as to the future of higher education which had begun during the depression years became still more aggravated after Pearl Harbor. For nearly a year there was no clear statement of policy from the government either on the status of students of draft age or on the use that might be made of colleges and universities for the war effort. The leadership in higher education was assumed by the American Council on Education, established during World War I to serve as a co-ordinating agency in this field. Two weeks after Pearl Harbor the Planning and Executive board of the council recommended the adoption of accelerated programs by colleges and universities and emphasized the importance of continued education for able students to meet the future demands for physicians, dentists, engineers and other professional workers. On Jan. 2, 1942, the council held a conference in Baltimore, Md., attended by representatives of 1,000 institutions of higher education. The keynote for education generally was sounded in a message from President Roosevelt:

We have one great task before us. That is to win the war. At the same time it is perfectly clear that it will be futile to win the war unless during its winning we lay the foundations for the kind of peace and readjustment that will guarantee the preservation of those aspects of American life for which the war is fought. Colleges and universities are in the particularly difficult position of balancing their contributions to these two ends. I am sure, nevertheless, that the leaders of our colleges and universities can be depended upon to find the wisest solution for the difficult problem of how to make this two-fold contribution. I am anxious that this national crisis

shall not result in the destruction or impairment of those institutions which have contributed so largely to the development of American culture.

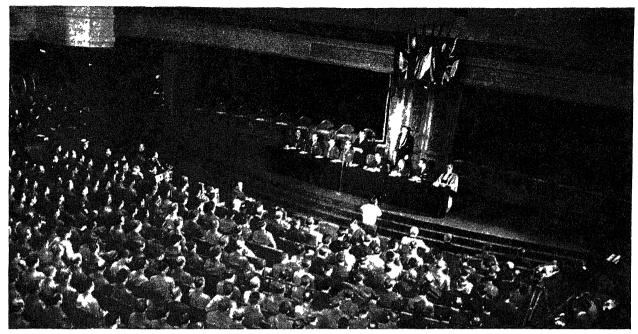

The conference endorsed the policy of acceleration to permit abler students to carry heavier programs and, with shorter vacations and the use of the long summer vacation, to graduate in three years or less. The policy was generally adopted by all colleges and universities, including women's colleges which were at first inclined to reject it. The problem of those students who relied on working through the summer vacation to pay their college expenses was met by a congressional appropriation of \$5,000,000 to be used for student loans to cover tuition and keep with a maximum of \$25 per month to each student; the loans were to be repaid at 21/2% interest. Nothing was done to improve the financial situation of the colleges and universities with serious effects upon the instruction staffs who carried heavier teaching loads for longer terms and with little or no additional pay. The burden on the institutions was further increased by the withdrawal for war work of teachers of mathematics, sciences and technical subjects, and of others into the armed forces.

Uncertainty about government policy continued, and a second conference was held in Baltimore on July 15–16, 1942. The conference deplored the failure of government to present an adequate and co-ordinated plan for the effective use of institutions of higher education for winning the war. The lack of plan impeded the flow of highly trained manpower essential to victory in a long war. It was pointed out that, while only 12% of the selectees were college graduates, 80% of those selected for officer training were drawn from this group. Despite uncertainties, all institutions made important contributions to the war effort through morale-building and through research.

The situation became clearer in 1943, when the war and navy departments entered into contracts with 479 institutions to give instruction in some designated branch of the armed services-engineering, aviation cadets, WACs, basic training, personnel psychology, language training, premedical studies, meteorology, chemical warfare, basic medical sciences and medical, dental and veterinary training. The candidates for the army specialized training programs (ASTP) were enlisted men selected by classification and personnel officers. The basic program included English, history, mathematics, physics and chemistry in addition to specialized studies. On completing the courses students were recommended for admission to officer candidate schools or were assigned for immediate service. A similar system was established by the navy in the V-12 courses. At the same time a more liberal Selective Service policy was adopted for students in preprofessional and professional courses, such as agriculture, forestry, pharmacy, optometry and in internships, provided they received certificates of competence from the institution attended and showed promise of completing their studies successfully by July 1, 1945. In February 1944 the war department announced that the ASTP would be partially discontinued; only 35,000 out of 145,000 students were retained in medicine, dentistry and engineering, and more than 300 institutions were affected. Some compensation was provided by the institution of a new examination by the army and navy for high school graduates, who were to be admitted to college until they were drafted.

* * *

Despite the difficulties and uncertainties of the decade, it stood out as an important era of fruitful discussions on the future of college education and the organization

Members of the U.S. armed forces studying at the Sorbonne in Paris, shown in the grand amphitheatre during an address by U.S. Ambassador Jefferson Caffery in 1945. They studied the French language there under the army educational program

of the college curriculum. The discussions arose out of general dissatisfaction with traditional practices, the tendency toward early specialization and the need of redefining the concept of liberal education in accordance with modern needs. In 1939 the National Society for the Study of Education devoted its Thirty-Eighth Yearbook, part II, to a consideration of General Education in the American College, which attacked the existing subject-matter organization of the curriculum and advocated the introduction of general courses in which materials from several of the conventionally separated fields would be brought together. In 1938 the Carnegie foundation published the results of the study of secondary and higher education in Pennsylvania in a report on The Student and His Knowledge by W. S. Learned and Ben D. Wood. The conclusions reached in the report were that college students did not acquire enduring and usable knowledge as a result of the quantitative system of points, units and credits, and that a basic pattern of education adapted to the capacities and abilities of the students needed to be formulated.

The war years stimulated widespread discussions of plans for reorganization of the curriculum. Among critical works the outstanding were Education for Freedom by Robert M. Hutchins and Liberal Education by Mark Van Doren, 2 strong proponents of a curriculum based on the study of the 100 best books, and The Teacher in America by Jacques Barzun, who presented a general criticism of higher education. The emphasis placed on the study of the sciences and technological subjects, as well as a shift of student interest to the social sciences during the depression years, turned the attention of educators in another direction. The approach was broadened to a consideration of the meaning of liberal education and particularly of the place of the humanities in higher education.

In 1943 the Association of American Colleges published the report of its Committee on Restatement of the Nature and Aims of Liberal Education, in which a program of studies adjusted to contemporary needs was recommended but without losing sight of enduring human needs. As a result of this report and the interest of the American Council of Learned Societies in the preservation of the humanities, national and regional conferences were held, and committees were appointed in a large number of colleges and universities to discuss the problems of the college curriculum.

Although the report of the Harvard university committee on General Education in a Free Society (1945) attracted widespread attention, it represented the trends of the proposals for the reorganization of college courses in many other institutions and already in practice in Columbia university for many years preceding World War II. In general the recommendations tended to limit the traditional elective courses and to require that in the first two years of the college course students should devote the major part of their time to a program consisting of humanities, social studies and science and mathematics as areas of general education. The committee appointed to study the reform of the curriculum at Yale university suggested three plans: (1) the standard plan to be followed by about 85% of the undergraduates and to include three basic requirements-English, systematic thinking and modern languages-and six distributional requirements in different areas of study; (2) the scholars or house program for selected students who had completed the standard plan; and (3) an experimental plan in integrated and controlled education in the first two years and in one of five major fields in the last two years to be elected at the beginning of the freshman year. The New Plan of Study in the Liberal Arts and Sciences adopted by Princeton university, Princeton, N.J., provided for an organic union between "general education" of underclass years in the major fields of learning, the divisional concentration in the middle years and the departmental concentration of upperclass years. This tendency to reduce the number of electives, to provide programs of general education and to postpone specialization was marked in most colleges of the United States.

The general introduction of the new programs, except on an experimental basis, was delayed by the large influx of veterans into the colleges in 1945–46. The educational provisions of the Servicemen's Readjustment act, 1944,

or the G.I. Bill of Rights, made it possible for any honourably discharged veteran whose education had been interrupted to continue his education or training for one year or less, a period which would be extended on the recommendation of the institution attended. The plan, whose supervision was placed under the administrator of Veterans' Affairs, provided originally for the payment of fees up to \$500 a year and subsistence allowances of \$50 a month for a single veteran and \$75 a month for a married veteran; the allowances were later raised to \$65 and \$90 a month respectively. In April 1946 it was estimated that 394,557 were enrolled in 1,686 approved institutions of higher education; the number rose to 714,477 in late 1946. The most serious problems raised by the return of veterans were the provision of housing accommodations and the inability of colleges and universities to accept all applicants. In a report of May 19, 1946, to President Truman by John W. Snyder, reconversion director, it was estimated that 2,080,000 persons, including 970,000 veterans, would wish to enter colleges in Sept. 1946 but that only 1,000,000, including 690,000 veterans, could be accommodated. It was also expected that high school graduates of 1946 would find serious difficulties in securing admission to colleges. The difficulties which began in 1946 would continue until 1950, when the number of veterans would begin to decline significantly.

The spectacular part played by science and technology in winning the war directed attention to the part that these fields of study could play in promoting welfare and progress in peace as well as for national defense. In 1945 Dr. Vannevar Bush, director of the Office of Scientific Research and Development, published the report of a committee appointed at the request of President Roosevelt. The committee was requested to report on the contributions made to scientific knowledge during World War II, on continuing the work done in medicine and related fields, on the selection and training of talent in scientific research and on government aid for research activities by public and private agencies. In the report, Science, The Endless Frontier, Report to the President on a Program for Postwar Scientific Research, the committee recommended federal aid for scientific education and research and the creation by congress of a National Research foundation to administer the funds to be appropriated. Several bills were presented in congress to carry out the recommendations of the Bush committee, but without any legislative action.

International Cultural Relations.-International cultural relations formerly had been conducted in the main by voluntary organizations. As a member of the Pan American Union (q.v.) the United States had for a long time participated in inter-American relations officially. In 1939-40 the government began to exchange students with Latin-American republics under the Buenos Aires Convention for the Promotion of Inter-American Relations, 1936. The active promotion of such relations with the Latin-American republics was undertaken as a part of the "good neighbour policy." In 1938 it was decided to create the division of cultural relations in the department of state to serve as a clearinghouse and co-ordinating agency for international cultural relations. The division was established to have "general charge of official international activities of the department with respect to cultural relations." These activities included the exchange of professors, teachers and students; co-operation in music, art, literature and other intellectual and cultural fields; the

distribution to libraries of representative works of the United States; supervision of government participation in international broadcasts; and the improvement and broadening of cultural relations with other countries. It was definitely specified that the division was not to be a "propaganda" agency. The outbreak of World War II limited the activities of the division to the western hemisphere. Conditions arising out of the war led to an expansion of these activities in two directions: (1) the provision, out of funds provided by the U.S. and Chinese governments, to assist Chinese students stranded in the United States and the establishment of a system of exchange of professors and technical experts with China; and (2) the extension of financial aid to the six non-sectarian colleges established in the near east by U.S. citizens.

The name of the division of cultural relations was changed first to division of science, education and art and later to division of cultural co-operation. In Jan. 1946 the division ceased to exist and its functions were distributed among the five divisions of the office of international information and cultural affairs. Divisions of the office included international press and publications, international motion pictures, international broadcasting, international exchange of persons and libraries and institutes, in addition to the office of the director and the interdepartmental committee on scientific and cultural co-operation.

At the end of 1945, Sol Bloom introduced a bill (H.R. 4982) superseding a bill introduced earlier in the year "To enable the Department of State more effectively to carry out its responsibilities in the foreign field by means of (a) public dissemination abroad of information about the United States, its people and its policies, and (b) promotion of the interchange of persons, knowledge, and skills between the people of the United States and the peoples of other countries." The bill, which would extend the activities of government in international cultural relations to all parts of the world, was reported favourably by the committee on foreign affairs, but no action was taken by the 79th congress.

The bill (S. 1636) introduced by Senator J. W. Fulbright in Nov. 1945 to permit the secretary of state to enter into agreements with foreign governments to use credits acquired by such governments from the sale of surplus property (lend-lease), for the exchange of students was passed by congress. The agreements entered into with the foreign countries were not to be in excess of \$20,000,000 in any one country nor of \$1,000,000 annually at the official rate of exchange.

In 1941 there was established within the Office for Emergency Management the Office of the Coordinator of Inter-American Affairs, later called the Office of Inter-American Affairs, to strengthen solidarity and understanding among the American republics. One part of the work was devoted to commercial and economic relations; the other to the promotion of the effective use of governmental and private facilities in such fields as the arts and sciences, education and travel, the radio, press and motion pictures. On the cultural side the office promoted the exchange of educators and co-operative efforts through the improvement of textbooks, visual aid and other teaching materials; it contributed to the improvement of methods of teaching English and to the advancement of standards of living through the development of mass literacy, health and vocational proficiency, and the reorganization of elementary and secondary education and of normal schools. To carry out the educational objectives the Inter-American Educational Foundation, Inc., was created in 1943; it entered into contracts with some 12 Latin-American countries which requested expert advice for the improvement of some particular aspect of their educational systems. In each case the North American experts co-operated with experts in the Latin-American countries which invited them.

Indirectly another method of familiarizing educators with North American practices was initiated in 1943 when the Inter-American School Service was created under the American Council on Education. Assisted by funds from the federal government, the organization was established to assist and advise North American sponsored schools in Latin-America.

In 1941 the department of state began to appoint cultural relations officers or cultural attachés to embassies and legations in Latin-American countries. After the end of the war cultural attachés were appointed to other countries as well.

The entrance of the government of the United States into the field of international cultural relations supplemented rather than displaced the activities of voluntary private agencies in this field. In all their activities the department of state and the Office of Inter-American Affairs co-operated with such organizations as the American Council on Education, the American Council of Learned Societies, the American Library association and the Institute of International Education.

* * *

In addition to the general reorganization of college studies, World War II and the prospective peace stimulated great interest in three areas of learning-foreign languages, international studies and the sciences. The need by the armed forces of experts in different parts of the world stimulated the provision of courses of instruction in languages other than the few normally taught in colleges and universities-Burmese, Japanese, Korean, Malay, Persian, Russian, Thai and many others. To meet the demands, experiments of various kinds were introduced in the methods of language instruction. Instruction in the respective languages was supplemented by "area studies" or studies of the culture and civilization of the people. It was expected that both experiments would have an effect on the study of languages in the postwar period.

In a number of institutions (Columbia, Illinois, Pittsburgh, Princeton, Stanford, and Yâle, for example) institutes and schools were established in international affairs and relations, some general in character, some devoted to a particular region of the world. In other institutions there was an extensive development of courses in these areas

(For statistics concerning U.S. institutions of higher learning, see Universities and Colleges.)

U.N.E.S.C.O.—Private lay and professional organizations played an important role in securing the establishment of an international agency for education. Plans for the creation of such an agency were discussed first in London in 1942 by the Conference of Allied Ministers of Education and in a report on Education and the United Nations, published in 1943 by a joint commission of the Council for Education in World Citizenship and the London International assembly. The plans aroused widespread interest in the United States and were publicized by such organizations as the Commission to Study the Organization of Peace, the Educational Policies commission of the National Education association, the Liaison

Committee for International Education, the Universities Committee on Post-War International Problems, the American Association for an International Office of Education and the United States Committee for Educational Reconstruction. Largely through the efforts of these and other organizations the establishment of an international agency for education was assured by the addition of the words "educational, scientific and cultural" in the United Nations charter wherever reference was made to "social, economic, and humanitarian affairs." The charter provided for the creation of the international educational, scientific and cultural organization as a specialized agency of the Economic council.

In Nov. 1945 a conference, attended by delegates from 43 nations and an observer from Venezuela, was held in London and in 2 weeks the constitution of the United Nations Educational, Scientific and Cultural organization, based essentially on a draft constitution prepared in the United States, was adopted.

The constitution was to come into force when accepted by 20 of its signatories.

A preparatory commission was appointed to make the necessary arrangements for the first session of the general conference of U.N.E.S.C.O. At the end of July 1946 President Truman signed the joint resolution adopted by congress making the United States a member of U.N.E.S.C.O.

Great Britain

To look back, at the end of the decade 1937-46, to British education in 1937 was to experience a mingled sense of remoteness and familiarity. The air of remoteness was due to three facts: the remarkable change in the public attitude towards education which the years 1940 to 1946 had brought about; the change and expansion (still in its infancy at the end of the decade, but already marked) in the concept of education; and the drastic remodelling of the public system of education in England and Wales. That of familiarity was due mainly to the fact that administration and practice had not yet caught up with legislation, and so most of the defects in the public service of education already obvious in 1937 remained largely unremedied ten years later.

In 1937, legislators and administrators were congratulating themselves that "a definite program of advance on many fronts" had been initiated. The Education act, 1936, had provided for the raising of the age of compulsory education from 14 to 15 years, though with exemption at 14 for "beneficial employment." The reorganization of the public elementary school into separate primary (5–11 years) and senior (11–14) divisions had been given fresh impetus by this act, and some fine senior schools were being built or projected. A national campaign for physical education, brought to a climax in July by the Physical Training and Recreation act, was in full swing. A nation-wide modernization of technical education involving a capital expenditure of \$48,000,000 was being planned.

Despite these signs of progress, the teachers were uneasy and apprehensive. The buildings in which many had to work were out-of-date and not infrequently in bad repair. Their pay was poor and their status in society equivocal. Thousands of classes were far too large. The secondary school curriculum had, in the endeavour to meet modern requirements, become a congested mass of unrelated subjects. The clauses in the 1936 act exempting children from attendance at school after 14 if they found "beneficial employment" were felt to be a retrograde step.

These and other complaints were giving rise to a feeling, as yet largely inarticulate, that nothing less than a complete reorganization of the statutory system of education was necessary. The publication in Dec. 1938 of the report of the consultative committee of the board of education on Secondary Education, with Special Reference to Grammar Schools and Technical High Schools (the Spens report) gave considerable impetus to this feeling. This, like the committee's earlier report on The Education of the Adolescent (the Hadow report, 1926), recommended that all varieties of postprimary education should be regarded as secondary education, and suggested, more controversially, that this education should be conducted in three main types of secondary school: grammar, technical and modern-thus opening a dispute which was still continuing at the end of the decade.

But by early 1939, reform projects were being overshadowed by the gathering threat of war. Schoolchildren were doing gas mask and evacuation drills, administrators preparing estimates for air raid shelters. On Sept. 1, 1939 -the day the school-leaving age was to have been raised to 15-the Germans invaded Poland, and Britain began to evacuate children from some 40 large centres of population. Within 11 days, 750,000 schoolchildren and many thousands of younger ones were transported into rural districts. As no bombing occurred, great numbers quickly returned home; by Christmas more than half were back. During these months the public system of education was gravely disorganized, but by the superhuman efforts of administrators, teachers and voluntary helpers order was restored. When heavy bombing began in Sept. 1940 the educational services were generally so well prepared that they could evacuate or improvise successfully at a moment's notice.

Wartime Movements.—Evacuation continued until 1945. It was never more than a limited success; British parents could not endure lengthy separation from their children. But it conferred some lasting benefits. It revealed the squalor in which the lowest strata of society were living, and thus woke the public conscience to acute concern about housing, health and education. It introduced many thousands of children and teachers to health-giving country life. It compelled teachers to think out new objectives and methods, and so did much to reorient the attitude of many towards the curriculum. It started the demand for "wartime nurseries" (of which 1,500 were set up), and thus led to widespread and intensified interest in nursery education. It was a main cause of the expansion of the school meals service which began in 1941 and in 5 years increased tenfold (from 3 to 30) the percentage of children receiving a nourishing midday meal at school. To this "off the ration" meal must be largely attributed the continued health and vitality of British children throughout

While the authorities were coping with the chaos caused by evacuation, three movements of profound social significance had their birth. In Nov. 1939 the government launched the "service of youth" by calling into partnership the local education authorities and the national voluntary youth organizations and offering generous money grants in aid of their joint efforts to provide educational, social and recreative facilities for young people beyond compulsory school age. Within three years an organized network of provision had covered the country, and the youth service thus created was by 1946 an integral part of the public system of education.

In Dec. 1939 the central advisory council for adult education in the British armed forces was set up by the universities, the local education authorities and voluntary bodies to provide lecturers and arrange other educational facilities for service men and women. In 1940 the government gave the council official recognition and financial support. In 1941 the war office supplemented this voluntary effort by including in the training of all soldiers a weekly compulsory discussion hour and setting up the army bureau of current affairs (A.B.C.A.) to supply fortnightly discussion pamphlets on military and civic topics. In the following year a three-hour-a-week compulsory educational program was tried out in some home commands. In 1944-45 a comprehensive scheme for education during the demobilization period was worked out for all three combatant services, and provided the pattern for peacetime provision. These wartime efforts undoubtedly stimulated in many thousands of men and women a desire for education not felt by them before.

In Dec. 1939 the president of the board of education asked the Pilgrim trust if it would make a grant towards the maintenance and encouragement of music and the arts during wartime. The trust gave £25,000 and in April 1940 the chancellor of the exchequer agreed to supplement this up to a maximum of £50,000. Thus came into being the council for the encouragement of music and the arts (C.E.M.A.), which for five years carried good music, drama and exhibitions of pictures into innumerable districts, both urban and rural, where such had never been heard or seen before. The response everywhere was enthusiastic and appreciative, and fully justified the continuance in peacetime of the work of C.E.M.A., which in 1945 received enhanced status as the arts council of Great Britain, a body supported out of public funds.

A complex of discontents brought to the surface mainly by evacuation, and including, significantly, widespread anxiety on the part of parents about their children, gave rise early in the war to a demand-which spread rapidly -for radical and far-reaching reforms in the public system of education. The board of education was not slow to take cognizance of this, and in 1941 circulated to interested bodies a comprehensive questionnaire. During the following 18 months or so it received in answer more than 100 detailed memoranda. Most of these were published in pamphlet form or noted in the press, and public interest was further aroused and focused by numerous public meetings held all over the country, notably by the Council for Educational Advance, formed in 1942 by the Trades Union congress, the National Union of Teachers, the Workers' Educational association and the Co-operative society.

The Education Act, 1944.—R. A. Butler, who became president of the board of education in July 1941, immediately entered into discussions with the numerous interests concerned with public education in England and Wales, and exactly two years later, after prolonged negotiations conducted by him with consummate skill, presented to parliament the government's policy for postwar

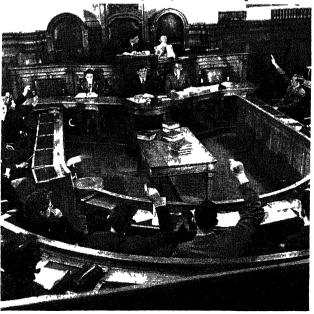

reform, in a White Paper entitled Educational Reconstruction. In Dec. 1943 he introduced into parliament a bill to reform the law relating to education in England and Wales, and on Aug. 4, 1944, this became law as the Education act, 1944.

This great act, the bulk of which came into operation on April 1, 1945, remodelled the public system of education by abolishing the previous division into elementary and higher education and organizing it in three progressive stages: primary (to age 12), secondary (12-18) and further, from the end of compulsory full-time education onwards; and by making it the statutory duty of the local education authorities to secure the provision of efficient education throughout the three stages (previously the provision of elementary education only was a duty). The president of the board of education, who could only "superintend," was made a minister with power to direct and control the authorities. The act raised the age of compulsory full-time education, first from 14 to 15, and later to 16, as soon as practicable. It established a system of compulsory part-time education (one day a week) up to 18 for all not in full-time education.

Tuition fees were abolished in primary and secondary schools maintained by the public authorities. All private schools were to be registered and inspected. Religious worship and instruction were made compulsory (though parents might contract out) in all maintained schools. A statutory duty was laid on parents to see that during the period of compulsory education (5–15) their children should receive efficient full-time education suitable to their "age, ability and aptitude."

To implement the act fully was expected to take years. Priority had been given to raising the school age to 15 and expanding the school meals service. Until permanent building could begin, prefabricated units were being used to make good war damage and supply the required extra accommodation. An emergency scheme of training for teachers was launched in 1945; it was expected to provide 36,000 in 3 years. Outstanding among curricular problems was the content of secondary education for the 80% of children who formerly received an elementary education only.

A British youth club in which members conduct mock town councils and are trained for future participation in local government

The Education (Scotland) act, 1945, applied the British government's policy to the Scottish educational system. The government of Northern Ireland published in Dec. 1944 a White Paper, Educational Reconstruction in Northern Ireland, proposing reforms comparable with those effected in Great Britain, and in Sept. 1946 the text of an education bill. In all the British dominions the spirit of educational reform was abroad at the end of the decade, notably in Australia and New Zealand, where large-scale programs were projected. Under the Colonial Development and Welfare act, 1940, much attention was being given to the development of education in the British colonies. (H. C. D.)

British Universities.—British universities in 1946 were faced primarily with the same problems as in 1917, but in a more acute form. Long before 1936, the 12 degree-giving universities in England and Wales—Birmingham, Bristol, Cambridge, Durham, Leeds, Liverpool, London, Manchester, Oxford, Reading, Sheffield and Wales—and the four Scottish universities, Aberdeen, Edinburgh, Glasgow and St. Andrews, were being increasingly harassed by those problems of accommodation and finance and, to a lesser degree, of staffing, which inevitably arose as the numbers of students increased.

What was true of the universities was no less true of the university colleges of Exeter, Hull, Nottingham and Southampton.

The extent of the growth in the demand for university education was best illustrated by recalling that, whereas in 1900 students in British universities numbered no more than 20,000, there were as many as 50,000 enrolled in 1936. Numbers continued at this level until the outbreak of World War II; but, as a result of the restrictions placed on arts students during the war years by the ministry of labour, the total fell to 38,000 in 1944.

Women accounted for more than 14,000 in the total figure and outnumbered men by more than 2 to 1 in arts faculties.

As in 1919, there was an unprecedented demand for places in the universities at the end of World War II. Former servicemen and women expressed the desire to continue courses interrupted by the war, and hundreds of others attracted by government grants who might not otherwise have sought a university education, applied for places. So great was the demand that the minister of labour found it necessary, in the early part of 1946, to ask university authorities to increase accommodation to the maximum and to reserve 90% of the places available for men in the academic year 1946–47 for former members of the forces. The result was, to take only one example which might be regarded as typical, that the number of men enrolled at Oxford in Oct. 1946 was 1,500 more than in 1938.

Even before this immediate demand arose, it had become manifest that it would not only be necessary to accommodate greatly increased numbers in the immediate postwar years, but also to embark on a policy of long-term planning. This latter need was made particularly obvious throughout the war years as a result of the unsatisfied demand for trained scientists; and in Dec. 1945 a committee was appointed by the lord president of the council "to consider the policies which should govern the use and development of our scientific man-power." In recommending that the number of university students in all faculties (and not merely in the sciences) should be doubled between 1946 and 1956, Sir Alan Barlow, who

presided over the committee, and his colleagues followed reports prepared during the war years by the parliamentary and scientific committee, the British Association committee on postwar university education and the Association of Scientific Workers.

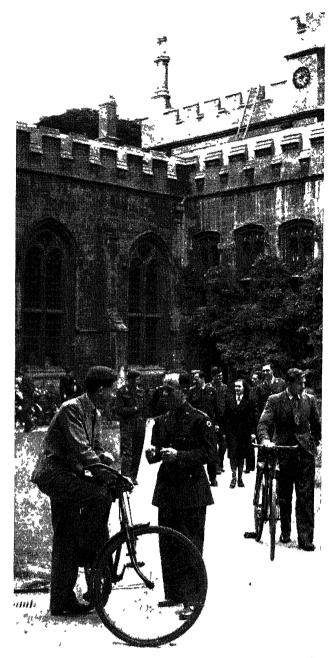

One factor which contributed to the demand for university education in prewar years was the development of scholarship schemes, more especially the institution of state scholarships and the extension of the schemes administered by local education authorities. In May 1946, the minister of education announced that increased financial help would be given to university students. Those who won open scholarships and exhibitions awarded by universities, colleges of universities and university colleges would become eligible to receive from the ministry such supplementary financial assistance as might enable them to pursue their studies freed from financial anxiety. In addition, state scholarships, of which 360 were awarded annually, were similarly supplemented; and local education authorities, since they now no longer needed to employ their resources in supplementing other awards, were in a position to help such students, other than those who had won open or state scholarships, as had "shown themselves to be of good intellectual quality and likely to complete a course at a university or elsewhere with credit."

Every increase in numbers had, of course, intensified the financial problems of the universities. This had been tacitly realized in 1919, when the university grants committee was appointed "to inquire into the financial needs of university education" and to advise the government "as to the application of any grants that may be made by parliament to meet them." When in 1937–38 the total revenue of the universities was £6,500,000, the treasury's contribution was £2,500,000.

Two important statements on the finances of the universities were made in 1946 by the chancellor of the exchequer. First, he stated his intention of making available to the universities in 1946-47 the sum of £9,450,000, including grants of £2,250,000 for capital expenditure. Secondly, he gave new and extended terms of reference to the university grants committee. These now included (a) inquiry into the financial needs of university education; (b) advice to the government on the application of grants; (c) collection and examination of information on university education at home and abroad; and (d) assistance, in consultation with the universities and other bodies concerned, in "the preparation and execution of such plans for the development of the universities as may from time to time be required in order to ensure that they are fully adequate to national needs."

It would, however, be idle to pretend that these problems and more particularly that of accommodation, were confined to British universities. They were equally the problems facing university authorities in the dominions. That the dominions were tackling these, as well as local, problems successfully, there was abundant evidence. There was everywhere a consciousness of the need for increased facilities; and of this there was no more striking evidence than the rapidity with which plans had matured for the building of the new university at Canberra, Australia.

The Germans wrecked the educational system in every country they occupied during World War II, whether by wholesale massacre and deportation of teachers, as in Poland, Greece and Yugoslavia, or by a combination of economic, physical and psychological pressure, as in France, Belgium, the Netherlands and Denmark. In every occupied country teachers played a prominent part in resistance, a most glorious example being that of Norway, where teachers and pupils combined to defy the invaders openly and despite brutal deportation of teachers, never gave way. Once liberated, every country turned to reform, Czechoslovakia being early in the field. There was a

marked disposition, extending to the formerly neutral countries of Sweden and Switzerland, to learn from the English reforms, which were being closely studied, often at first hand

Eggs

World egg production declined in Europe and China during the decade 1937-46, but the increases in the United States and Canada helped greatly to offset the loss, so that in 1946 the U.S. department of agriculture estimated that world egg production was only 5% below the prewar average. North America and Europe continued to produce about three-fourths of the total world output. China was becoming an important egg exporter before 1940, particularly in dried eggs, but that source disappeared in 1941. The United Kingdom imported large amounts of dried eggs and by 1945 was able to supply about 200 eggs per capita compared with 196 in the prewar period 1935-39. Egg production in Europe was off about 50%. The large stocks of dried eggs accumulated in 1943 and 1944 were used for relief purposes, leaving stocks at a low level at the end of the decade.

Production of eggs in the U.S. responded to the sudden increased demand of the decade 1937–46 and provided a large part of the food needed during World War II. Previous to 1937, egg production in the U.S. had been fairly stable, ranging from 30,000,000,000 to 40,000,000,000 with a prewar (1934–39) average of 38,000,000,000. The high rate of increase began in 1940, and by 1945 the output was 40% larger. Production increased 50% during the decade 1937–46, about 10% being due to the increased output per hen. The output per laying hen increased from an average of 130 eggs in 1937 to 152 in 1945 as

the result of better breeding, feeding and disease control. The poultry industry had made great strides after 1920 and had seen wide adoption of the results of research in the form of better practices. A large supply of concentrated feeds was also an important factor. The production of eggs increased more rapidly than did the output of poultry meat.

The promptness with which the U.S. poultry industry could respond to the increasing demand was due in considerable measure to the changes in hatching practices. The commercial hatchery had replaced the "setting hen" as well as the small incubator in many poultry raising communities. Whereas, in 1937, the hatcheries produced about 687,000,000 chicks, in 1943 the output was 1,283,-044,000 or more than 75% of the chicks raised on farms. The development of the practice of "sexing" chicks at the hatchery and selling pullets or cockerels as the buyer desired was also an innovation. The egg producer could get pullets to increase his flocks without the cost of raising a flock of both sexes, with the males to be sold as broilers. This development favoured higher specialization on egg farms. The baby chicks were also treated to prevent diseases. Through the selection of setting eggs from highproduction flocks, the average production was increased,

Eggs marked for export from Denmark in the summer of 1945. After the close of European hostilities the country was able to resume export of butter, bacon and eggs, but in smaller quantities than before World War II

as was shown by the high output of more than 150 eggs per hen attained in 1946. The egg supply for U.S. civilian consumers increased from 306 eggs in 1937 to 390 in 1945.

The price of U.S. eggs advanced quickly in late 1939 after the outbreak of war in Europe, but heavy production checked the rise and prices broke, causing many egg handlers to lose heavily on stored eggs. The average farm price of eggs was 21.3 cents per dozen in 1937 and dropped to 17.4 cents in 1939. Prices then began to advance and continued up to 37.1 cents in 1943, dropped to 32.4 in 1944 and made a new high of 37.8 cents in 1945. During the first half of 1946 it ran below the level of the same period in 1945. While egg production in 1946 was smaller than in 1945, the stocks of shell and frozen eggs were larger.

Price-support programs for eggs, first tried in 1933, were put into operation from the spring of 1941 primarily to get eggs for lend-lease shipment. This practice was continued through 1946 with numerous changes. Up to Jan. 1946, the equivalent of about 88,000,000 cases of eggs, or 12% of total farm production, was purchased by the U.S. department of agriculture. Dried eggs accounted for nearly 90% of the total, most of which was shipped under lend-lease. Purchases of shell eggs reached a total of 2,917,000 cases in 1940, dropped to 1,755,000 cases in 1941, then rose to a record high of 5,609,000 cases in 1944. In Aug. 1941 eggs were put under the Steagall act, which provided that prices be supported at 85% of parity. This continued until Nov. 1942, when the minimum was set at 90% of parity, and farmers were in all cases to receive an annual average of 34 cents per doz. The actual average was 37.1 cents per doz. The support program was continued through 1944 at 27 cents per doz. average for producers' straight-run eggs, and for 1946, 29 cents.

The National Poultry Improvement plan under the U.S. department of agriculture was in operation in 41 states in 1936-37, covering 30,558 flocks supplying 1,239 hatcheries. By 1944-45 the number had increased to 73,578 flocks supplying 3,181 hatcheries. By thus improving the quality of the laying hens raised at the source, the great gain in output was attained.

The expansion of the U.S. egg drying industry was an outstanding factor in utilizing the large egg crop. From the small total of 2,291,000 lb. of dried eggs produced in 1937, the output rose to 320,742,000 lb. in 1944. The dried egg was a space-saver for overseas shipment under lendlease and was well adapted to military uses in distant areas. (See also POULTRY.) (J. C. Ms.)

Egypt

An independent kingdom in northeast Africa, Egypt is bounded N. by the Mediterranean sea, S. by the Anglo-Egyptian Sudan, N.E. by Palestine, E. by the Red sea and W. by Libya and the Sahara. Area: c. 383,000 sq.mi. (cultivated land, 13,600 sq.mi.); pop. (census 1937) 15,904,525; (est. June 1944) 17,620,000. Chief towns (pop. est. 1944): Cairo (cap., 1,455,400); Alexandria (756,000); Port Said (132,000); Tanta (105,000); Mansura (79,000); Damanhur (71,000); Asyut (65,000). Language: Arabic; religion: Mohammedan 91%, Coptic 7%. Ruler: King Farouk I. Prime ministers: Mustapha Nahas Pasha (May 1936–Dec. 30, 1937); Muhammad Mahmoud Pasha (Dec. 30, 1937–Aug. 1939); Ali Maher Pasha (Aug. 18, 1939–June 21, 1940);

Hassan Sabry Pasha (June 28, 1940-Nov. 14, 1940); Hussein Sirry Pasha (Nov. 16, 1940-Feb. 2, 1942); Mustapha Nahas Pasha (Feb. 5, 1942-Oct. 8, 1944); Ahmed Maher Pasha (Oct. 8, 1944-Feb. 24, 1945); Mahmoud Fahmy el-Nokrashy Pasha (Feb. 24, 1945-Feb. 15, 1946); Ismail Sidky Pasha (Feb. 17, 1946-Dec. 8, 1946); Mahmoud Fahmy el-Nokrashy Pasha (after Dec. 9, 1946).

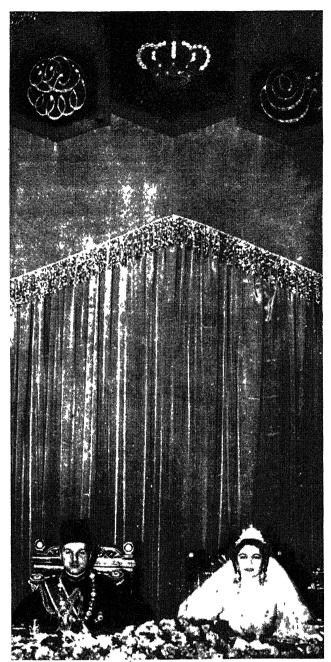

Decade of Transition.-Three features characterized the history of Egypt during the decade which followed the signing of the Anglo-Egyptian treaty of Alliance in Aug. 1936. The country moved further in the direction of the recognition of its status as a fully independent kingdom, which was the avowed object of all its political parties. It suffered political convulsions at short intervals, owing to the continued conflict of aims and personalities between the two most powerful elements in Egyptian society, the Wafd (the strongest and best organized political party) and the palace and its supporters. Thirdly, there was a notable increase in commercial activity, coupled with a rapid growth in industrialization, which brought about an increase in population, especially in the cities (for which precise figures were not available) and the development of organized labour on the western model. Only the third of these features was at all a new development in the life of modern Egypt. The other two were characteristic of the whole period from 1919, after which the struggle for power between the two main opposing elements of Egyptian political life took place against a general background of the national desire for greater independence. Egypt had need of foreign support as much as Britain had need of insuring the free passage of her ships through the Suez canal. Egyptian governments showed their recognition of this by their readiness to co-operate with Britain, so far as they were able, and their opponents customarily took advantage of the government's necessity in this regard by attacking the ministers of the moment on grounds of subservience to Britain. Between 1937 and 1946 there were examples of both Wafd and palace governments co-operating closely with Britain, and of the palace parties and the Wafd, in opposition, vigorously attacking their opponents for such co-operation.

The treaty of 1936 was signed while Mustapha Nahas Pasha, the leader of the Wafd, was in power, but at a period of party truce and collaboration. It bore the signatures of most prominent Egyptian statesmen of the time, and was accorded almost nation-wide approval. Its terms brought to an end nearly all the outward signs of Egyptian dependence. Britain withdrew its high commissioner and the two countries exchanged ambassadors. At Britain's request, a special session of the League of Nations unanimously elected Egypt in May 1937 to membership in the league. British forces were to be withdrawn to the neighbourhood of the Suez canal and were ultimately to hand over to the Egyptian army the defense of the country. Under the terms of the treaty, certain strategic roads and bridges were built, which proved of the utmost value during the campaigns of World War II. One of the chief survivals of the days of Egyptian dependence did not concern Britain alone among foreign powers: this was the regime of capitulations, whereby the nationals of most European, and many American, states were not subject to the same laws or accountable in the same courts as Egyptians. On May 8, 1937, a conference at Montreux, attended by representatives of Egypt and of all the capitulatory powers, agreed to a new convention, which was ratified by the Egyptian chamber on July 19, 1937, and came into force on Oct. 15, 1937. By this agreement the system of capitulations, a survival of Ottoman days, was to be abolished.

Egypt obtained full rights of justice and taxation over all residents, and the mixed courts were to apply only Egyptian law to non-Egyptians during a period of 12 years, after which they were to be abolished.

Wafdist Opposition.-After the formation of the Egyptian kingdom in 1922, the rivalry of the palace and the Wafd had been greatly exacerbated by a strong personal hostility between the first king of modern Egypt, Fuad I, and the first leader of the Wafd, Saad Zaghlul Pasha. A similar rivalry soon showed itself between their respective successors. King Farouk came of age on July 29, 1937. In October he demonstrated his independence of attitude by appointing as chief of the royal cabinet (political adviser) Ali Maher Pasha, in spite of the Wafd's strong objection to him. The popularity of the Wafd was declining; student riots, fomented as usual in Egyptian politics by the opposition, and an attempt on Nahas Pasha's life, made this evident. On Dec. 30, 1937, the king was able to dismiss Nahas Pasha and to appoint Muhammad Mahmoud Pasha as premier of a cabinet in which there were no Waldist ministers. The Wafd, however, remained exceedingly powerful in the country. The party was well organized and had great powers of emotional appeal of which it made skilful use. On the other hand, its power of retaining the support of the mass of the people was much invalidated by its inability to hold the loyalties of its more prominent members. In Aug. 1937, Mahmoud Fahmy el-Nokrashy Pasha, who had been generally regarded as the mainstay of Nahas, quarrelled with his leader and went formally into opposition, and, in 1939, other prominent Wafdists broke away from Nahas and formed, in memory of his predecessor, a party called the Saadists, which co-operated with the government. Even with this addition of strength to the cabinet, the task of administering the country in the face of Wafdist opposition was a most difficult one and, in Aug. 1939, Muhammad Mahmoud Pasha resigned. The opposition was fierce, and took, as always, a markedly anti-British form. But there was a general fear of Italian ambitions in Egypt, so that popular support for anti-British appeals was limited. At the same time the Wafd had weakened itself by the internal dissensions among its leaders, which had brought about the formation of dissident groups, notably the Saadists. On Aug. 18, 1939, Ali Maher Pasha was able to form a strong cabinet with Saadist support, and in September, there was no serious opposition to the government's action in implementing the Anglo-Egyptian treaty by breaking off relations with Germany and by declaring a state of siege which amounted, in effect, to the imposition of martial law.

Egypt and the War.—The intervention of Italy (June 10, 1940) brought the war to Egyptian soil. British forces in Egypt were at once engaged with the Italian army in Libya, and those in the Sudan with the garrisons of Ethiopia. Italian aircraft bombed objectives in Egypt, and Egyptian territory was invaded. An immediate consequence of this development was the fall of Ali Maher Pasha. Wafdist refusal to co-operate made a government of national union impossible. The government of Hussein Sirry Pasha maintained the policy of non-belligerency. Egypt was, except for a few elements, some of them highly placed, strongly pro-Allied in sentiment and, on Sept. 22, 1940, four Saadist ministers resigned as a protest against the government's failure to declare war. But there was good reason to suppose that the British government was not anxious for this step, since Egyptian non-belligerency enabled them to profit by axis acceptance of the status of Cairo as an "open city," and since there was no immediate prospect of their being able to provide the

King Farouk of Egypt and his young queen, Farida, at their wedding banquet, Jan. 20, 1938

Egyptian armed forces with adequate equipment. In 1940 the absence of a market for Egyptian cotton brought on an economic crisis which was met by the British action in purchasing the entire crop for about £25,000,000.

Early in 1942, the latent political crisis came to a head. Relations between King Farouk and the government were impaired by a dispute over a minor constitutional issue which might have been settled quietly but for the widespread unpopularity of the cabinet. The Wafd had steadily gained in popular favour until it commanded the support of the overwhelming majority of the people. The consequent insecurity of the government's position alarmed the British authorities who were responsible for the defense of the country. The British ambassador, Sir Miles Lampson, began to press for the setting up of a more representative government. Nahas Pasha refused the support of the Wafd to any coalition cabinet and the king was

unwilling to call upon him to form his own. Finally, under very considerable pressure, King Farouk agreed to summon Nahas Pasha, who, after a three-day crisis, became prime minister at the head of an all-Wafdist cabinet on Feb. 5. In view of the Wafd's long history of conflict with British influence in Egypt, the significance in this change of government was at first not fully understood outside the country. Allied peoples were uneasy and the German radio continued for more than a month to treat the change as a serious British setback. But Nahas Pasha had been responsible for the signing of the Anglo-Egyptian treaty, and the Wafd had always claimed that it stood for a policy of independence and alliance so far as Britain was concerned. Very soon the reality of Egyptian support for the Allies was put to a severe test.

In the summer of 1942 German designs on Egypt came very near to success. A British setback in Libya, with heavy loss of tanks, opened the way to the German Afrika Korps, which advanced to the gates of Alexandria. For some weeks, while reinforcements were diverted from the far east or dispatched from Britain, the fate of Egypt was in the balance. At this time the defenders of the country were wholly dependent on Egyptian support. So dependent were the Allies upon Egyptian labour and services and

Egyptian students at Cairo protesting the continued presence of British troops in 1946. The banner reads "Long live Nile valley unity"

upon the tranquillity of their base that any serious Egyptian hostility, a campaign of riots and terrorism such as that of 1919, or a well-planned general strike, such as was organized after the war had ended, would have crippled the defending armies. But throughout the crisis Nahas Pasha and his government maintained a steady and determined policy of co-operation with Britain, and Egyptian public opinion remained apparently quite unmoved by axis propaganda and promises, and kept extraordinarily calm under the threat of imminent invasion. In Oct. 1942 this attitude was amply justified by the victory at El Alamein and the expulsion of the axis forces from northeast Africa.

Political opposition to the Wafd was at first very slight. After Nahas became prime minister, parliament was dissolved. New elections in March 1942, boycotted by the opposition parties, returned 231 Wafdists in a house of 264. But the Wafd's characteristic failure to hold its leaders together soon showed itself. In May 1942 Makram Ebeid Pasha, minister of finance and the second man in the party, resigned and formed a new party. Next year he published a "black book," bringing serious charges of corruption against the government. Parliament supported Nahas Pasha but the accusations were not forgotten.

Pan-Arab Movement.-After the danger of German invasion had passed, interest in external politics was concentrated on the affairs of the Arabic-speaking world. The idea of union of the Arab peoples of Asia, Egypt's eastern neighbours, was not new, but in the early days of that movement Egypt had played no part. Sympathy with the Arab case in Palestine had led in Oct. 1938 to the calling of a pan-Arab congress in Cairo. Thereafter Egypt played a prominent part in Arab affairs. The prospects of an Arab union were already being studied officially, when the crisis in Lebanon in Nov. 1943 provoked a strong outburst of pro-Arab sentiment from all parties. The king joined with the government in expressions of sympathy with the Lebanese. During 1944 Zionist claims upon Palestine encouraged the Arab movement, and a conference of Arab states, presided over by the Egyptian prime minister, met at Alexandria in September. On Oct. 7 the conference dissolved, having laid the foundations of the Arab league (q.v.), of which Egypt was the strongest and most important member-state. On the next day Egyptian internal politics reasserted themselves with the abrupt dismissal of Nahas Pasha by the king.

The differences of opinion between the king and Nahas Pasha would probably have led to an earlier dismissal but for the Arab conference. The new government, led by Ahmed Maher Pasha, a Saadist and once a close associate of Nahas Pasha, included Makram Pasha and leaders of most parties except the Wafd. The elections, held in Jan. 1945, were boycotted by the Wafd, and resulted in a big government majority. They were notable for the first appearance in Egyptian elections of Socialist candidates. Following the decisions of the conference of Allied leaders at Yalta, the Egyptian government declared war on the axis and, on the day this was announced, the prime minister was assassinated in the parliament buildings by a young Egyptian who had been released from internment a short time before for fascist sympathies. Nokrashy Pasha, the foreign minister, succeeded him, and the cabinet remained otherwise unchanged.

Postwar Rise in Anti-British Sentiment.—The Wald, in opposition, reverted to the traditional policy of demanding concessions from Britain and of accusing the government of neglecting Egyptian interests. Its chief claims were for the total evacuation of British troops and, later, for

"unity" with the Sudan. Anglo-Egyptian relations were good on the government level, but popular support for these claims was encouraged by circumstances. Owing to Egypt's importance as a base for the far eastern war, Germany's defeat had appeared to lead to an increase, rather than to a lessening, in the number of foreign troops in the country, while British plans to develop Sudanese self-government led to fears of a break between that country and Egypt, which shared it with Britain in nominal condominium.

The defeat of Japan was followed by the removal of the wartime press censorship. Political vehemence increased, each party accusing the other of lack of patriotism, and popular feeling against Britain rose swiftly. In Dec. 1945 the government was obliged to ask Britain for a revision of the treaty. The Wafd continued its agitation and was joined in this, although in nothing else, by the new and powerful Brotherhood of Moslems. Student riots broke out and on Feb. 15, 1946, Nokrashy Pasha resigned. Two days later Ismail Sidky Pasha became prime minister. He pressed Egyptian claims upon Britain, and, at the same time, kept a firm hand upon the internal order of the country. Student demonstrations and well-planned general strikes were organized, designed to show the strength of popular feeling for the evacuation of British troops. Although generally orderly, these sometimes gave rise to undisciplined mobs which, on two occasions, led to clashes with British troops and to bloodshed.

Meanwhile, negotiations with Britain proceeded. The British prime minister, Clement Attlee, announced in the house of commons on May 7, 1946, his government's intention to withdraw all British forces from Egypt, according to a time-table to be jointly agreed upon, and to negotiate for a treaty of mutual assistance. The way for an agreement between the two governments was made clear and it was likely that, a year earlier, a treaty on this basis might have been easily concluded and have been generally popular in Egypt. But the delay had exacerbated feelings, so that political parties hostile to the Egyptian government were able to find support for increasingly extreme demands. The British delegates who discussed terms with an Egyptian delegation (boycotted by the Wafd) made slow progress, although the evacuation of British forces was begun. On Oct. 7 Sidky Pasha visited London; he discussed Anglo-Egyptian relations with the British foreign secretary, and on his departure on Oct. 26 made an optimistic statement. In Egypt, however, his claim that "Britain has accepted the unity of Egypt with the Sudan under the Egyptian crown," was held to conflict with the British prime minister's statement, made in the house of commons on Oct. 28, that "no change in the existing status and administration of the Sudan is contemplated." The future status of the Sudan became the chief object of opposition propaganda. On Dec. 8 Sidky Pasha, who had been ill for some time, resigned. He was succeeded by Nokrashy Pasha.

In ten years Egypt had emerged as the richest and strongest of middle eastern countries. Industrialization had begun to be important. At Mehalla al Kubra, nearly 30,000 workers were employed in the manufacture of textiles. Cairo, for which accurate population figures in 1946 were not available, had become by far the greatest city in the middle east and was estimated to contain nearly 2,000,000 inhabitants. Egyptian air lines linked the population centres of the eastern Mediterranean, and the war had led to the employment of Egyptians in many thousands by the Allied forces. In consequence, Egypt had available a skilled and semiskilled labour force, unrivalled in the

area, and was evidently ripe for further steps in industrialization. Organized labour showed its strength in the general strikes of 1946, and, although these were part of a national demonstration, it seemed clear that the existence of grave social problems would profoundly affect the life of the country, as soon as the tension with regard to Britain was relaxed. Eichelberger, Robert Lawrence

Eichelberger (1886—), U.S. army officer, was born March 9, 1886, in Urbana, O. A graduate of West Point, he was commissioned a 2nd lieutenant in 1909, saw service on the Mexican border and in the Panama Canal Zone, and in 1918 was awarded the D.S.C. and D.S M. while serving with the army of occupation in eastern Siberia. In addition, three decorations were bestowed upon him by the Japanese government. After World War I he was stationed in the orient. On returning to the U.S., Eichelberger was attached to the general staff

for several years in the 1920s. He returned to West Point and occupied the post of adjutant general from 1931 to 1935, when he was transferred to Washington to serve as secretary to the general staff in the years preceding the outbreak of World War II. In 1940 he was reassigned to West Point, where he streamlined the entire curriculum of training. During his 14 months as superintendent of the academy, he introduced an air training course which enabled cadets to qualify for commissions in the air force.

Made a brigadier general in 1940, Eichelberger was promoted to the rank of major general in July 1941 and to that of lieutenant general in Oct. 1942. In Jan. 1943 Gen. Douglas MacArthur placed him in command of U.S. troops in Papua. As field commander in the Netherlands New Guinea in 1944, he took part in the invasion of that territory in April. He led the 8th army at Luzon in Jan. 1945, and the Mindanao invasion on March 12. After the defeat of Japan in August, he was in command of the 8th army occupation troops and, on Dec. 19, 1945, was placed in charge of all U.S. occupation troops in Japan.

Eire

A republic¹ associated with the British commonwealth of nations, Eire occupies five-sixths of an island to the west of Great Britain. Area: 26,601 sq.mi.; pop. (1936 census) 2,968,420; (1943 est.) 2,949,713. Chief towns (1943 est.): Dublin (cap., 495,074), Cork (75,484), Dun Laoghaire (42,105), Limerick (42,070). Languages: English 76.3%, Irish (Gaelic) 23.7%; religion: Roman Catholic 93.4%, others -6.6%. Presidents: Dr. Douglas Hyde (de h-Ide) (June 25, 1938–June 24, 1945); Seán T. O'Kelly (after June 25, 1945). Prime minister (Taoiseach): Éamon de Valéra (from March 1932).

British Agreement.—From 1937 to 1946 Eire (Ireland) saw considerable change in practically every field: international, political, legislative, economic and social. There was no change of ministry. For the whole period the Fianna Fáil party under Eamon de Valéra was in office. The most marked change occurred in the international sphere. The ten-year period opened with Eire in deep conflict with Britain and ended with all questions between the two countries settled with one exception—that of partition.

The settlement took place in April 1938 after negotiations which had begun in the previous January and looked more than once almost certain to break down. There had been several major matters in dispute. In 1932 the Irish parliament (Dáil Eireann) abolished the oath of allegiance to the crown which all deputies had taken till then; also the Irish government retained the land annuities and other sums totalling £5,000,000 a year. These the Fianna Fáil party, until then in opposition, asserted were neither morally nor legally due to Britain, and payments were suspended immediately after the party was elected to office. The British government for its part asserted: (1) that the oath of allegiance was an integral part of the treaty of 1921 and that the previous Irish government had recognized this; (2) that the Irish government had also accepted Britain's right to the disputed moneys by agreements solemnly

Leamon de Valéra, speaking in Dáil Eireann on July 17, 1945, said in reply to a query as to whether the state was a republic: "The position, as I conceive it to be, is this we are an independent republic, associated as a matter of our external policy with the states of the Brutish commonwealth. To mark this association, we avail ourselves of the procedure of the External Relations act just quoted, by which the king recognized by the states of the Brutish commonwealth therein named acts for us, under advice, in certain specified matters in the field of our external relations."

entered into, and had in fact paid them for ten years. The Irish reply was that the oath was not mandatory in the treaty, that in any case it was entirely a matter of domestic policy within the competence of the people to decide and that they had just decided in the general election of February of that year (1932) that the oath should go. As to the agreements regarding the disputed sums, the Irish government stated that these had never been submitted to parliament for ratifications by the people's representatives and could not for that reason be regarded as binding. The dispute lasted for six years.

The Irish government placed the moneys in a suspense account and offered to abide by international arbitration. Britain proposed commonwealth arbitration which was not accepted. Complete deadlock ensued and the British government placed such import duties on goods from Eire as would recoup it for the loss annually of £5,000,000. The Irish government replied in kind, taxing imports from Britain. The effect on trade was severe and, coming on top of the world slump then nearing its nadir, threatened the whole Irish economy. Irish exports to Britain fell from £35,000,000 in 1931 to £19,000,000 in 1935 and British exports to Ireland from £49,000,000 to £37,000,000 in the same period.

Two significant changes occurred in 1937. In Britain Neville Chamberlain succeeded Stanley Baldwin in May, and in Eire the electorate by plebiscite passed into law an entirely new constitution. The constitution, which replaced that of 1922, made many major changes. It declared all Ireland to be the national territory; it declared that portion of Eire which was formerly the Irish Free State to be a "sovereign, independent, democratic state"; it vested, either in the elected president, for which office it provided, or in the government, all the powers formerly held by the crown; it left for determination by ordinary legislation Eire's relationship with Britain and other countries; it reconstituted, but only more or less as an advisory body, the senate which had been abolished after defeating several important bills from Dáil Eireann, the popularly elected house.

Britain and the Constitution.—This constitution, which had first been approved by the Dáil before being legalized by the people's vote (July 1, 1937: 685,105 for, 526,945 against), came into force six months after the plebiscite, i.e., on Dec. 29, 1937. On the same day a statement was issued from 10 Downing street, London, which referred particularly to the opening articles of the constitution:

His majesty's government in the United Kingdom have considered the position created by the new constitution which was approved by the parliament of the Irish Free State in June 1937 and came into force on Dec. 29. They are prepared to treat the new constitution as not affecting a fundamental alteration in the position of the Irish Free State—in future to be described under the new constitution as "Eire" or "Ireland"—as a member of the British commonwealth of nations. . . . They cannot recognize that the adoption of the name "Eire" or Ireland or any other provisions of those articles (2, 3 and 4) involves any right to territory or jurisdiction over territory forming part of the United Kingdom of Great Britain and Northern Ireland. . . .

The constitution was, however, regarded by the Irish government as finally determining Eire's status and as thus removing from the field of Anglo-Irish discussions Eire's relationship with other states or its internal sovereignty. As soon as it came into force, therefore, De Valéra proposed to the British government a conference on remaining differences. Chamberlain accepted the proposal, and after three months of negotiation a comprehensive agreement was signed on April 25, 1938. It ended what had come to be called the "economic war" on terms favourable

to Eire-for the payment by the Irish government of one lump sum of £10,000,000 the disputed £5,000,000 a year was compounded, and the penal tariffs on both sides were withdrawn. The settlement also restored unconditionally to Irish sovereignty what were known as the treaty ports— Cobh, Berehaven and Lough Swilly-which since the general evacuation in 1922 were still in British possession. At the same time a clause in the 1921 treaty (article 7b) which gave Britain what defense facilities it might require "in time of war or of strained relations with a foreign power" was repealed. Thus all Ireland with the exception of the six northeastern counties (known as Northein Ireland) came exclusively under Irish sovereignty. A trade agreement was also concluded which gave to Britain a specially advantageous position in the Irish market. This comprehensive settlement was ratified after full debate by the parliaments of both countries.

War and a Pledge.—The treaty ports were taken over by the Irish government in a simple ceremony on July 11, 1938, and this enabled the defense of the state to be planned as a unit in view of the increasingly troubled international situation. The Irish government had already indicated on several occasions that in another great war Eire would remain neutral but would regard itself as having the special duty of ensuring that no attack on Britain would be made from Irish soil. On May 29, 1985, De Valéra in a speech in the Dáil had pledged himself that "our territory will never be permitted to be used as a base for attack upon Britain." As war approached, this pledge was renewed, coupled with a repetition of the government's determination to remain out of the conflict. Meanwhile at Geneva, Ireland used whatever influence it possessed to uphold the League and secure the pacific settlement of international disputes.

Neutrality.—The war that broke out on Sept. 1, 1939, was one therefore which the Irish nation felt it had no part in bringing about and when a special meeting of Dáil Eireann was summoned on Sept. 2 De Valéra could say:

"Back in February last I stated in a very definite way that it was the aim of government policy, in case of a European war, to keep this country, if at all possible, out of it. We have pursued that policy and we intend to pursue it. . . ." His declaration of neutrality was supported by the leaders of all opposition parties.

This unanimity continued through the six years of war, and manifested itself especially at times of tension and crisis. A defense conference was set up on which all opposition parties were represented. It remained in being from May 30, 1940, to May 16, 1945. In June 1940, when after the fall of France it looked as if Ireland would be invaded, the leaders of the three main parties addressed a great joint meeting in Dublin and called for volunteers for the defense forces. A total of 202,000 answered the call in ten weeks. On Nov. 5, 1940, when it seemed as if pressure would be put on the country to hand over the treaty ports; on May 21, 1941, when the British government proposed to extend conscription to Northern Ireland; and on Jan. 26, 1942, in his statement on the landing of U.S. troops in the north without consultation with the Irish government, De Valéra was able to speak as a national leader, voicing the views of the people irrespective of politics. This was particularly evident in March 1944, when the text of his reply to the U.S. note demanding the expulsion of German and Japanese diplomatic representatives was published. In this reply he refused to take such action which, he said, was universally regarded as the first step to war. Public opinion immediately manifested its support of the Irish government's stand. The four daily papers (three of them opposition papers) all approved the refusal and for the first time in the history of the parliament De Valéra re-

Banners carried by striking farmers of Eire through the streets of Dublin in 1939 asked for a fairer return on farm produce and urged agricultural workers to stay on the land. Both needs were mutually dependent factors in the drive for increased tillage and national self-sufficiency

ceived a non-party ovation when he entered the house. It was because this unanimity was so obvious to Irishmen during the whole period of the war that in his most notable broadcast during the ten years, his temperate reply to Winston Churchill on May 16, 1945, De Valéra said: "That Mr. Churchill should be irritated when our neu-

trality stood in the way of what he thought he vitally needed, I understand, but that he or any thinking person in Britain or elsewhere should fail to see the reason for our neutrality I find it hard to conceive." Fears were expressed in many Irish quarters during those years that misunderstanding of Eire's attitude would lead to its isola-

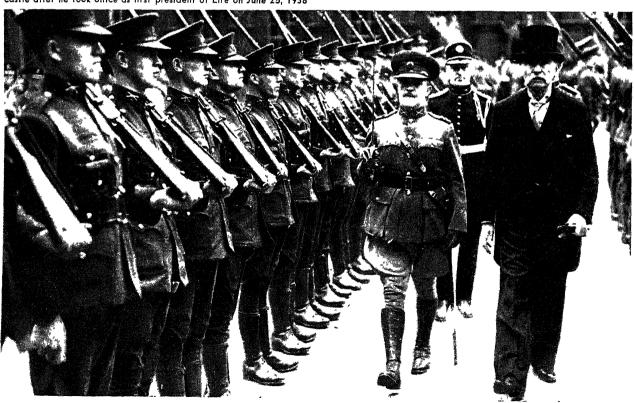

tion from other countries.

Effects of War.-World War II affected Irish life in numerous ways. Many industries dependent on raw materials from overseas had to go on short time or close down altogether. All forms of building and construction were particularly affected, as steel and timber both had to be imported. In consequence many Irishmen, including numbers of craftsmen, lost their employment or had their earnings reduced. This factor and other stronger, more idealistic motives occasioned the great flow of young Irishmen into Britain throughout the war. From Jan. 1, 1940, to Sept. 30, 1945, more than 194,000 exit permits were issued by the Irish government, and it was believed that in addition to the many thousands who left Ireland between the start of the war and Jan. 1, 1940, of whose numbers there was no record, many thousands of others travelled subsequently via Northern Ireland to Britain without permits. Large numbers of those who entered Britain worked in war factories; large numbers of others joined the British fighting services, winning many decorations for valour and receiving high praise from Churchill and other British leaders. Irish casualties both in the actual fighting and from bombing in Britain were considerable.

The internal economy of Eire was much changed by the war. When De Valéra took over the government in March 1932 a scheme to make the country self-sufficient was launched. This had gone a considerable distance by the end of 1936. It was pushed forward strongly in the next two years. Then difficulty in securing industrial plant halted the setting up of factories and the threat to imports of feeding-stuffs envisaged in the tense international situation made the tillage drive more urgent. Industry, which had expanded markedly up to 1938, began to contract, though in certain articles of manufacture, footwear, clothing, sugar, cement, practically all home needs were being supplied from home factories. Agriculture, on the other hand, got its greatest fillip from 1937 forward. A price policy had encouraged the farmers to increase the wheat acreage from 21,000 in 1932 to 220,000 in 1937. At the outbreak of the war it was 255,000 ac. and in the succeeding six years compulsory tillage and eventually compulsory wheat-growing brought it to 660,000 ac. in 1945, which was close to full requirements. At the same time other tillage crops useful for animal feeding were more widely grown. In all, the tillage area which had been 1,592,000 ac. in 1937 was 2,567,143 ac. in 1944 and declined slightly to 2,413,314 ac. in 1946. As distinct from volume of production which, taking all branches of agriculture, increased by a little more than 12% after 1937 the value more than doubled, increasing from £41,000,000 in 1938 to £97,000,000 in 1945.

Industrially the country fared less well. Increased prices raised the value of industrial output of transportable goods from £35,500,000 in 1938 to £41,600,000 in 1944 but there was a fall of almost 15% in volume. This was afterward rapidly made up and on Feb. 11, 1947, Sean Lemass, vice-premier, announced that the 1946 output was "substantially above" that of 1938. External trade was heavily hit. The values fell from a total trade of £66,900,000 in 1937

 $(\pounds_{44,100,000}$ imports; $\pounds_{22,800,000}$ exports) to $\pounds_{57,700,000}$ in 1944 (£28,100,000 imports; £29,600,000 exports) but the volume of imports in 1944 was less than a third of that of 1937 and the volume of exports just under half. The ending of the war in Europe had an immediate effect on external trade, which in 1945 surpassed in value any year after 1931.

Financially the ten years showed some remarkable results. At the beginning of the period (March 1937) the annual expenditure was £31,000,000 and it showed little change until 1940, when it began to reflect the heavy defense and other charges. It then rose steadily until in March 1946 it was £53,000,000 (including £3,000,000 voted for the relief of distressed Europe). Only one loan was raised during the six war years, £8,000,000 in 1942; the rest of the war charges were borne on current taxation and small-scale borrowings. As a result the financial position of the country was strong in 1946.

Four General Elections.—The ten years were, apart from international events and their repercussions, lively political years. No fewer than four general elections were held and two presidential elections, one of them contested. Eire's electoral system—adult suffrage with proportional representation—was designed to encourage the smaller par-

ties. The effect was that the strongest party had difficulty in securing a workable majority. The William T. Cosgrave administration (1922–1932) and the De Valéra administration were alike embarrassed by this.

In June 1937 a normal general election was held, as the five-year term since Jan. 1933 had almost come to an end. The state of the parties after the election was Fianna Fáil (government party) 69; Fine Gael (chief opposition party) 48; Labour 13; Independents 8. After the election of the speaker, Fianna Fáil was in a minority in a house of 138, and in May 1938 it was deleated by one vote on a motion it had made one of confidence. It appealed to the country and gained eight seats, while all other parties lost. The figures were: Fianna Fáil 77; Fine Gael 45; Labour 9; Independents 7. After the 1938 election the Dáil ran its full life and the house was not dissolved until June 1943.

War shortages, restrictions, etc., caused the government party and the principal opposition to lose heavily while a new party of small farmers (Clann na Talmhan) and Labour gained. The result was Fianna Fáil 67; Fine Gael 32; Labour 17; Clann na Talmhan 14; Independents 8. Fianna Fáil was in a minority, though by far the largest party. It formed a government and in May 1944 was defeated, again by one vote, on a major bill. The president accepted

De Valéra's request for a dissolution (the constitution empowered the president either to do this or to send for the leader of the opposing combination) and the result of the ensuing general election showed a striking gain for the government party. Labour, which had split into two groups, and the Farmers each lost five seats. The figures were: Fianna Fáil 76; Fine Gael 30; Labour 8; National Labour 4; Clann na Talmhan 9; Independents 11. Owing to successes at by-elections, the figures by the end of 1946 were: Fianna Fáil 78; Fine Gael 28; Labour 8; National Labour 4; Clann na Talmhan 10; Independents 10.

The presidential elections were held in 1938 and 1945. In the first there was no contest. All parties agreed that Dr. Douglas Hyde, founder of the Gaelic league and among the foremost Gaelic scholars, should be first president of Eire under the new constitution. He was elected by acclamation on May 4, 1938, and took office in a colourful ceremony on June 25. The term was set at 7 years and in 1945 Dr. Hyde, being then 84, retired. The second presidential election was a three-cornered one. Fianna Fáil put forward the Tánaistè, or vice-premier, Seán T. O'Kelly; Fine Gael nominated General Seán McKeon; and Dr. Patrick McCartan stood as an Independent. Each of the candidates had taken a notable part in the Irish struggle for independence. The result of the voting was: O'Kelly 537,965, McKeon 335,539, McCartan 212,791. The lowest candidate was eliminated and his transferable votes distributed with the final result: O'Kelly 565,165, McKeon 453,425.

Important Legislation.—The ten years were marked by the passing of much important legislation. In 1937 a bill was passed controlling prices of many commodities. In 1938 an Irish Red Cross society was established by law. In the same year workers were given a statutory right to holidays with pay and a bill was passed improving the conditions under which shop assistants worked. In 1939 a central board to develop tourism was set up and financed by the state, and a comprehensive Town Planning act was passed. In 1940 an act extended the principle of city management'to the county councils. In that year also the Dublin Institute of Advanced Studies with its two schools of mathematical physics and Celtic studies was established by legislation. A means for amalgamating too numerous trade unions and easing the friction from interunion rivalry was provided by an act of 1941. A central bank was established in 1942. In 1943 legislation of the last century dealing with the sale of intoxicating liquor was codified and mod-

Children's allowances were provided by an act of 1944; in the same year an important measure amalgamated all public transport in Eire. Aid for Europe at the rate of £3,000,000 a year was provided first in 1945. In the same year provision was made by legislation for the hydroelectrical development of other rivers in addition to the Shannon and the Liffey, and later another act set up the turf board to direct the production of electricity from peat on a scale almost equal to the output of the Shannon. In 1945 also a new and up-to-date system for the care and cure of mental diseases was instituted by legislation.

In 1946 the most important decision of Dáil Eireann was by unanimous vote to authorize the government to apply for Eire's admission to the United Nations (this application was unsuccessful through the opposition of the U.S.S.R.). An Industrial Relations act which provided labour courts for the pacific settlement of labour disputes came into operation on Sept. 23, the date on which the

emergency powers order pegging wages was revoked. The reorganization of all harbours and ports was provided for in another 1946 act, and provision was made for their future development. New legislation was passed for the further extension of air traffic under the two Irish companies, Aer Rianta and Aer Lingus, which in Dublin and on the Shannon had established two of the most modern airports in Europe.

Eisenhower, Dwight D.

Eisenhower (1890-), U.S. army officer, was born Oct. 14, 1890, at Denison, Tex. He was admitted to West Point, graduating in 1915, and during World War I was an instructor at several U.S. army camps. After graduating from the Army War college, he served in the Philippines as Gen. Douglas MacArthur's chief of staff. In June 1942 he was given command of the U.S. headquarters in England and was promoted to the rank of lieutenant general. He commanded U.S. forces that landed in North Africa, Nov. 8, 1942, and on Feb. 6, 1943, was made commander of all Allied forces in North Africa; five days later, he was made a full general. Under his leadership, Allied armies destroyed the axis armies in Tunisia, conquered Sicily and invaded Italy. These impressive victories led to his appointment as commander in chief of Allied invasion armies, announced Dec. 24, 1943. Eisenhower shifted his headquarters to England, and launched the invasion of France June 6, 1944. By the end of the year his armies had retaken virtually all of France and Belgium and part of the Netherlands, and had penetrated Germany. On Dec. 15, 1944, Eisenhower was promoted to the newly established five-star rank of general of the army.

The Allies suffered a temporary setback in Dec. 1944 when the German counteroffensive in the Ardennes forest ripped a 60-mi. hole in the Allied line. His forces subsequently recemented the line, and Eisenhower then launched the grand offensive, Feb. 23, 1945, that collapsed the wehrmacht by May 7. Eisenhower, who was noted for his diplomatic as well as military skill, was

Mayor La Guardia of New York city welcoming Gen. Dwight D. Eisenhower at La Guardia airport on June 19, 1945, prior to a victory parade through the city

designated chief U.S. representative in the Allied military government for the rule of Germany, March 29, and moved his headquarters to Frankfurt-on-Main, May 26. In response to criticism of U.S. laxity in enforcing the denazification program, he ordered the removal of prominent former nazis from the civil administration. Eisenhower, favouring a unified command for the armed services and the maintenance of a peacetime army of 1,500,000, was named chief of staff of the U.S. army, succeeding Gen. George C. Marshall, on Nov. 20, 1945. In this position, throughout the rest of 1945 and the early months of 1946, he directed the greatest military demobilization program in U.S. history.

Elections

In the United States, the decade, 1937–46, saw the historic Republican party stage a slow but steady recovery to an approximate restoration of political balance between the two major organizations in the United States. It also witnessed a progressive disintegration of the heterogeneous elements—labour, liberal, farm, white-collar and political—which Franklin D. Roosevelt had fashioned into a national machine that proved unbeatable in the presidential contests of 1932, 1936, 1940 and 1944.

It seemed that the "Grand Old Party," like the Whigs, faced utter collapse after the debacle in the 1936 elections. Their presidential nominee, Alfred M. Landon of Kansas, had waged an ineffective battle, running on an outdated and conservative platform that took no cognizance of new conditions and needs. He carried only two states—Maine and Vermont. His ill luck gave birth to a political wisecrack that reflected the atmosphere of those days—"As Maine goes, so goes Vermont!" The electoral college tally was 523 for Roosevelt and 8 for Landon.

As an accompaniment of the national ticket's disastrous defeat, the G.O.P. lost heavily in congressional and state contests. They had emerged from the 1936 struggle with only 17 U.S. senators, 89 members of the house and 8 governors. They did not control the legislative or political machinery of a single great state or city. The Democrats owned the United States, politically and emotionally.

Flushed by his unprecedented triumph, Pres. Franklin D. Roosevelt startled and shocked both friends and enemies early in 1937 when he advanced a scheme for revising the structure of the supreme court of the United States by the addition of six members. He admitted that his plan for "packing" the high tribunal was an effort to liberalize it so that he could obtain decisions more favourable to his New Deal reforms. He characterized the admittedly conservative court as a "horse and buggy" institution operating in an automobile age.

Although his proposal was defeated—congressional conservatives and liberals rebelled against it—its promulgation tended to weaken the Democrats in the very hour of victory. It antagonized such distinguished party veterans as James A. Farley, then national chairman and postmaster general, Alfred E. Smith, Carter Glass and John W. Davis. It aroused hostility among labour and white-collar groups. It gave substance to opponents' recurring indictments that the president aspired to dictatorship. It was, as his advisers subsequently conceded, a major mistake of strategy, especially as deaths and resignations soon enabled him to name a majority of the court.

Nevertheless, the off-year (1937) elections showed no clear trend, although there were scattered signs of a conservative reawakening. In several states, notably New Jersey and Arkansas, the Democrats sent to the senate men with anti-New Deal sympathies.

Manhattan, New York county, gave a start to a comparatively young man destined for an important role in national affairs. The voters elected Thomas E. Dewey, the "Fusion" candidate, as district attorney. His antiracketeering achievements in that office won him the governorship of New York in 1942 and the Republican presidential nomination in 1944. Fiorello Henry La Guardia, another colourful figure, was re-elected as New York mayor by a majority of 450,000.

In 1938 the G.O.P. made comparatively impressive gains. The opposition increased its U.S. senate strength from 17 to 23 and its house membership from 89 to 169. It won 10 additional governorships, making a total of 18, and captured several key commonwealths—Pennsylvania (Arthur H. James); Ohio (John W. Bricker); Michigan (Frank Dwight Fitzgerald); Wisconsin (Julius Peter Heil); Minnesota (Harold E. Stassen). The only important states which the Democrats carried were New York, where Governor Herbert E. Lehman defeated Thomas E. Dewey, and California, where radical Cuthbert Olson won over Frank E. Merriam.

Also in 1938 occurred the "great Roosevelt purge." In resentment against their outspoken opposition to portions of his legislative program, Pres. Roosevelt campaigned openly, albeit contrary to the wishes of his political aides, against Sen. Walter F. George of Georgia, Sen. Ellison D. Smith of South Carolina, Sen. Millard F. Tydings of Maryland and Rep. John J. O'Connor of Manhattan, chairman of the powerful house rules committee. All except O'Connor were re-elected.

The Republicans continued to make small headway in the off-year of 1939. Although defeated for mayor of Chicago, Ill., by Edward Joseph Kelly, Dwight Green, the Republican nominee, polled 638,068 votes, a larger percentage of the total vote cast than had been given to his party by Chicagoans in the 1932 and 1936 presidential elections. In Cleveland, Ohio, the G.O.P. re-elected Mayor Harold H. Burton, who subsequently advanced to the U.S. senate, and, by appointment of Pres. Harry S. Truman, to the supreme court.

Third Term.—In 1940 the no-third-term tradition was thrown overboard. Pres. Roosevelt withheld his intentions until the last moment. Vice-Pres. John Nance Garner of Texas and James A. Farley of New York, each seeking the nomination for himself, opposed the third-term effort. Indeed, Farley was placed in nomination at the Chicago convention by Sen. Carter Glass of Virginia, Woodrow Wilson's secretary of the treasury. Largely in protest against the violation of the two-term tradition, Farley resigned as national chairman and postmaster general in July, to be succeeded by Frank Walker of Pennsylvania, a long-time, personal friend of Pres. Roosevelt.

Roosevelt was easily renominated, however. His personal selection for the vice-presidential nomination was Henry Agard Wallace of Iowa, then secretary of agriculture. Republican off-year victories in farm areas were partially responsible for the Wallace choice. He was also popular in labour and liberal circles.

The 1940 Republican national convention at Philadelphia, Pa., produced one of those rare and dramatic phenomena of U.S. politics—the spectacle of a rank, non-political interloper stealing the nomination from veterans who had been born and reared in the ancient G.O.P. homestead. There had been no similar performance since William Jennings Bryan, in 1896, won the Democratic presidential nomination with his "Cross of Gold" sermon.

Wendell L. Willkie was the political stranger's name. He had been head of Commonwealth & Southern, a private utility concern that had battled the Roosevelt administration's public power program. He was a Wall Street lawyer who had never before taken an active part in politics. He had the backing, it seemed, of nobody but personal admirers, youthful political amateurs and gallery rooters at the Philadelphia convention. He also had a strong asset in his own right—a fresh, vivid, explosive personality.

But the historic fact is that Willkie entered the race with powerful political and financial support of the kind that counted. His candidacy seemed to be a spontaneous combustion affair only because of skilful management. He was known to share Pres. Roosevelt's views on international matters (pro-British, anti-Hitler), and, therefore, he had helpful friends in important places.

He claimed only a scattering of pledged delegates, however, when the convention assembled. The leading candidates in the early balloting were Gov. Dewey of New York, Sen. Robert A. Taft of Ohio and Sen. Arthur H. Vandenberg of Michigan. But Willkie was not to be stopped. The galleries, editorial writers and plain people on the street demanded this dark horse entry, their imagination apparently stirred by his strange and daring tactics, his seeming sincerity and selflessness. His reluctant running-mate was Charles L. McNary, then Republican leader of the U.S. senate.

It was a peculiar campaign because there was no fundamental disagreement between candidates Roosevelt and Willkie. Each favoured the same foreign policies, Willkie merely demanding less secrecy about aid to the Allies. He did charge that the administration's program was leading the nation into war, but he subsequently admitted before a congressional committee that this was only "campaign oratory."

Both men endorsed basic New Deal reforms, with Will-kie simply promising to administer them more economically and efficiently. The G.O.P. nominee suffered from the handicap of a rasping, untrained voice, which broke down in the midst of his speaking tour, whereas Roosevelt crooned over the radio with a delivery rarely matched in U.S. political combat.

Pres. Roosevelt also had the advantage of position. Although both he and Willkie assured the electorate that the United States would not become involved in the European war, Roosevelt had obtained repeal of the Arms Embargo bill, sponsored a strong national defense program and had begun to transform the nation into an "arsenal of democracy." His vigorous actions apparently appealed to people growing concerned over Adolf Hitler's victories and atrocities.

The president did not campaign in the conventional manner, but he was able to capitalize on his role of commander in chief by making numerous "inspection trips" to munition centres. He also delivered several timely radio talks. On these tours and in his broadcasts he never mentioned his opponent by name.

Roosevelt, in short, assumed a nonpolitical stance. He ran as the "man on horseback" in a world crisis. He strengthened this impression by forming a virtual "coalition government" on the eve of the Republican convention. He named as secretary of war Henry L. Stimson, who had been Herbert Hoover's secretary of state. For head of the navy department he chose Frank Knox, who had been Alfred Landon's running mate in 1936. He also appointed numerous Republican industrialists to key

posts in the emergency agencies which he created in preparation for possible involvement in World War II.

Despite his disadvantages, Willkie made a respectable run. He polled 22,304,755 votes, or 44.8% of the total (as against 27,243,466 for Roosevelt), and he got 82 electoral ballots. Moreover, had it not been for Roosevelt's overwhelming majorities in approximately 12 great industrial centres, where his labour-liberal-racial supporters enabled him to win those states' electoral votes, he would have been defeated.

Roosevelt and Willkie eventually became such close associates that the president sent his 1940 rival on an around-the-world trip as a diplomatic emissary. Willkie loyally supported both the preparation for and prosecution of World War II, and, before his death in Oct. 1944, he had thrown his great personal influence into the movement to transform the G.O.P. from a noninterventionist into an interventionist organization.

John L. Lewis's desertion of Roosevelt in the 1940 struggle provided a spectacular touch to the campaign, although it had no visible effect on the outcome. Although a Republican, the head of the United Mine Workers had been an ardent New Dealer in 1932 and 1936. In the latter year his labour organization loaned and contributed \$500,000 to the Democratic national committee.

The friendship between Pres. Roosevelt and the miners' boss was first strained during the sit-down strikes in Detroit, Mich., automobile plants in early 1937, when the chief executive frequently expressed irritation over the strikers' tactics. Moreover, the two men were so alike in their theatrical temperaments that a permanent alliance was an impossibility. In her post-Roosevelt memoirs, Frances Perkins, secretary of labour during this era, declared that Lewis urged his own nomination as vice-president on Roosevelt in 1940; she intimated that Roosevelt's refusal motivated the Iowa-born Welshman's walkout.

Despite last-minute appeals by Roosevelt in a White House interview, Lewis urged his followers in a nation-wide radio speech to vote for Willkie. His major charge was that the administration was heading the nation into war. There was no evidence, however, that his attitude affected the vote in the coal-mining regions.

In his radio address Lewis promised—or threatened—to resign as head of the Congress of Industrial Organizations if F.D.R. were re-elected. He kept his pledge, and his old friend and vice-president of the U.M.W., Philip Murray, was elected in his stead.

The Lewis defection eventually had its effect on national politics. As he turned away from the Roosevelt administration, the C.I.O., under the leadership of Murray and Sidney Hillman, then head of the International Ladies Garment Workers union, aligned itself even more closely with the party in power. For a while the American Federation of Labor remained neutral.

Postwar labour difficulties, and especially Pres. Truman's anti-inflation program, gradually alienated the labour element. Lewis brought his U.M.W. back into the A.F. of L. in 1945. Two of the railroad brotherhoods, angered over Truman's refusal to approve wage increases in late 1945, threatened to spend union funds to defeat him if he sought re-election in 1948. Several major C.I.O. units protested volubly against the administration's failure to hold down postwar prices, arguing that increased living costs had offset their pay boosts. Growing labour dissension and dissatisfaction became a serious problem for Democratic political strategists after V-E and V-J days in 1945.

Willkie's refreshing personality and philosophy, even though hard-boiled Republicans resented him, had aided

the party in its slow regrowth. In the 1940 contests the G.O.P. gained 5 U.S. senate seats for a total of 28. It lost 7 in the house, reducing its membership to 162. It boosted its gubernatorial quota from 18 to 20. It held state control in 20 of the 36 commonwealths outside the "solid south."

Congressional and state contests in 1942 returned the Republicans to the status of an effective opposition force. They won 3 additional governorships for a total of 23. They gained 10 additional senate seats, giving them a representation of 38. In the house they increased their representation to 209, or only 9 less than a nominal majority.

Gains for Conservatives.—As a matter of fact, the G.O.P. gain in 1942 gave conservatives voting control of both branches of congress. Capitol Hill supported full prosecution of World War II without any partisan spirit or division, but the close margin in house and senate meant an end to the era of New Deal reform. An alliance of reactionary southern Democrats and Republicans was usually able to outvote or outmanoeuvre the administration forces, and this alignment persisted into the postwar period.

The Democrats' 1942 losses were largely because of the war's irritations and pressures. The major factors held responsible for Republican resurgence were: (1) resentment over rationing and restrictions on the sale of foods, gasoline and other everyday products; (2) antagonism in agricultural areas over administration refusal to include farm-labour costs in fixing the parity price; (3) a general belief that Washington was coddling organized labour for partisan purposes; (4) hostility toward federal bureaucracy and regimentation; and (5) general dissatisfaction with the progress of World War II.

The Republicans won additional governorships in 1942 in such important states as New York, California, Michigan, Connecticut and Idaho. Two of the most prominent personalities whom the G.O.P. placed in power were Gov. Thomas E. Dewey at Albany, N.Y., and Gov. Earl Warren at Sacramento, Calif. Dewey defeated John J. Bennett, Jr., his Democratic opponent, by 630,000 votes, becoming the first Republican governor of New York in 20 years. Besides Gov. Dewey and Gov. Warren, other Republican figures were brought or kept in the national political picture in 1942. Leverett Saltonstall of Massachusetts, John W. Bricker of Ohio and Harold E. Stassen of Minnesota were elected for third terms as governors of their respective states.

The Republican senate gains in 1942, although important because of their number, had another significance. Foreshadowing postwar political trends, brash newcomers retired respected and distinguished veterans whose seats had seemed as solid as Gibraltar. Sen. George W. Norris of Nebraska, a Capitol Hill patriarch and a Roosevelt ally, was ousted by Kenneth Wherry, an unknown automobile salesman. Chapman Revercomb defeated Sen. Matthew M. Neely of West Virginia, a violent liberal and "friend of the people." Homer Ferguson, whose one-man prosecution had helped clean up gangsters in Detroit, won over Sen. Prentiss Brown of Michigan.

Henry Cabot Lodge followed in the footsteps of his famous grandfather by trouncing New Deal representative Joseph E. Casey in the senatorial election in Massachusetts. In New Jersey the Hague machine suffered its first serious setback in years when Albert W. Hawkes, former president of the chamber of commerce of the United States, defeated the Jersey City mayor's offering, Sen. William H. Smithers.

Final tabulation of the 1942 vote furnished partial explanation for the Democratic losses. Examination of the

returns showed a surprising apathy on the part of an electorate which Roosevelt's personality and faculty for dramatizing public affairs had awakened to his own advantage. The total vote cast in the house contests was only 28,111,583, the smallest in any nation-wide contest in 22 years. The Republicans polled 14,217,320, or 50.6% of the congressional vote, while the Democrats corralled only 47.4%. It was still axiomatic that a small turnout was damaging to the Democrats.

The comparatively meagre attendance at the polls was attributed to several factors: (1) the presence in the armed forces of almost 5,000,000 men and women of voting age; (2) the industrial migration which made it physically impossible for millions to register and vote in their home communities; and (3) the preoccupation of people with their war jobs or other emergency responsibilities.

The Republican trend persisted in scattered 1943 contests, which were the first to be held in hours of Allied triumphs on all war fronts. The G.O.P. won numerous special contests for filling congressional, state and municipal vacancies. They recaptured many cities and counties which had been under Democratic rule since the appearance of Pres. Roosevelt on the political scene. Although still the minority party insofar as control of the legislative and executive branches of the federal government was concerned, the Republican party had become a solvent concern by 1943. As the year closed the G.O.P. had 208 members in the house, 37 in the senate and 26 governorships in the 36 states above the Mason and Dixon line.

Since both victorious and losing candidates in 1943 urged vigorous prosecution of World War II, that issue was not involved directly. The outcome appeared to reflect widespread discontent and dissatisfaction over the administration's handling of domestic problems, such as labour, prices, rationing, taxes, etc.

When Pres. Roosevelt was asked for comment on the Nov. 2, 1943, outcome, he replied that he was more interested in the war communiqués from the Solomon Islands and the newly established Italian battle front. Wendell Willkie interpreted the results as a rebuke to Washington, but Gov. Dewey said that Republican victories in his state had no national significance. Harrison E. Spangler, then Republican national chairman, welcomed the 1944 presidential year with this statement: "The Republican party is the resurgent, dominant, victorious party of the United States! It is a unified party looking to the future."

The year 1944, however, did not turn out to be the "future" foreseen by Chairman Spangler. In that year Franklin D. Roosevelt staged an amazing, second repudiation of the two-term tradition. Seeking four more years in the White House, he defeated Gov. Dewey by a popular vote of 25,602,505 to 22,006,278. The electoral college count was 432 for Roosevelt and 99 for the Dewey-Bricker slate.

Gov. Dewey, however, proved to be the strongest opponent the president had met. Except for Roosevelt and Willkie, Dewey received the largest vote ever given to a candidate for the White House. Roosevelt owed his triumph to two factors—the nation's engagement in a global war which the Allies seemed about to win, and the efforts of the Political Action committee, an affiliate of the C.I.O.

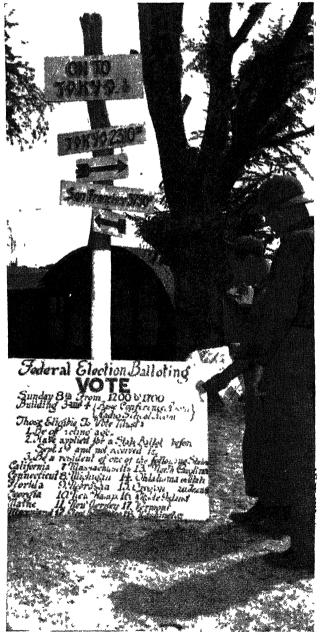

Millions of anti-New Deal conservatives, Republicans and Democrats, voted for Roosevelt because they felt that his experience and close association with the war effort would tend to bring speedy victory. They did not wish to risk a change of commander in chief in the midst of the

conflict.

But Sidney Hillman's P.A.C. workers were the Democrats' shock troops. When it appeared that the vote might be small, and that millions of transplanted war workers might not bother to go to the polls, Hillman's organization conducted a well-organized and financed campaign for a record enrolment and election day turnout of union labour members. Indeed, Roosevelt might have lost such electorally important states as Massachusetts, New York, New Jersey, Pennsylvania, Illinois and Michigan except for C.I.O. majorities in the great industrial centres of those states. The only major city carried by Dewey was Cincinnati.

U.S. armed forces' victories abroad contributed to the political victory at home. Gen. Dwight D. Eisenhower's penetration of the German reich and Gen. Douglas A.

U.S. troops in the South Pacific studying the regulations for overseas balloting, prior to the presidential elections of 1944

MacArthur's landing on the Philippine island of Leyte led White House aides to remark, and only semihumorously, that "Ike and Doug are our two ablest campaigners."

Pres. Roosevelt's abandonment of Henry A. Wallace as his 1944 running-mate provided an exciting interlude in a generally dull campaign. Roosevelt praised and mildly recommended the Iowan's renomination, but when the municipal machine bosses—National Chairman Robert E. Hannegan, Mayor Edward J. Kelly of Chicago, Mayor Frank Hague of Jersey City and Edward F. Flynn of the Bronx, N.Y.—convinced the president that Wallace's "radical" views would damage the ticket in their bailiwicks, Roosevelt urged the convention to name either Justice William O. Douglas of Oregon or Sen. Harry S. Truman of Missouri, then chairman of the special senate commit tee investigating the national defense program. He put Douglas first.

James Francis Byrnes of South Carolina, then war mobilization and reconversion director, was an eager candidate for second place on the ticket, but Hillman turned thumbs down on him because of his southern and supposedly antilabour background. Ironically, it was Sen. Truman who visited Hillman in his hotel suite at Chicago in an effort to obtain his support for the Byrnes nomination.

"We cannot afford to take a chance on nominating Mr. Byrnes," said the P.A.C. chairman.

"We cannot afford to take a chance on renominating Mr. Wallace," retorted Truman. "Whom will you support?"

"You," replied the labour boss.

With Roosevelt-Hillman backing the Missourian won the nomination that landed him in the White House upon Pres. Roosevelt's death on April 12, 1945.

In his nomination acceptance speech, which was delivered by radio to the Chicago convention from the San Diego, Calif., naval base, Pres. Roosevelt declared that he would not have the time or inclination to campaign "in the usual partisan sense." But he reserved the right to correct opposition misstatements and to report to the U.S. people on matters of national moment.

Roosevelt vs. Dewey.—Roosevelt seemed to take Dewey's candidacy lightly as the campaign opened. But, according to the memoirs of his personal and political associates, he became worried over October reports that his opponent was gaining strength. The president forswore his attitude of aloofness and took to the stump. Wartime censorship on his movements was abandoned temporarily.

Besides delivering six major political speeches, he toured the metropolitan areas of New England, New York, New Jersey and Pennsylvania in an open automobile in cold, biting rains. It was generally believed that he sought to answer by this physical challenge to the elements whispered suspicions that his health would not permit him to handle a man-killing assignment for four more years.

Pres. Roosevelt planned and executed his last-minute offensive like the political David Belasco he was. He never mentioned Dewey by name, but he heaped ridicule on the New York governor by innuendo. He stressed his own experience as against his foeman's youth, thus transforming Dewey's attack on the "tired old men at Washington" from a liability into an asset.

Roosevelt recalled the G.O.P.'s record of nonintervention after World War I and its sabotage of the League of Nations. He contrasted the apple-selling days of the Herbert Hoover regime with a 1944 national income of \$150,000,000,000. He recounted U.S. feats of heroism on the European and far eastern fronts and lauded domestic

production of arms. He wound up by promising 60,000,000 jobs in the postwar period. His spellbinding speeches won back numerous elements which seemed headed for the Republican column before he struck out forcefully and persuasively.

Nevertheless, Roosevelt and Dewey rarely came to grips on major issues. The Republicans' 1944 platform virtually endorsed the basic New Deal economic, social and labour reforms. So, after giving faint praise to his opponent's accomplishments Dewey challenged chiefly the administration of the federal machinery. He declared that Washington was run by "tired and quarrelsome old men" and maintained that it was "time for a change."

The Democrats surprised even themselves by gaining 21 house seats in the 1944 struggle and by losing only 1; in the senate they also fared well in state contests, winning back the governorships of Ohio, Massachusetts, Missouri, Idaho and Washington.

The 1944 outcome was interpreted as evidence that the U.S. people favoured scrapping of the historic policy of nonintervention. The voters retired three senators—John A. Danaher of Connecticut, James J. Davis of Pennsylvania, Gerald P. Nye of North Dakota, and three house members—Hamilton Fish of New York, Stephen A. Day of Illinois and Melvin J. Maas of Minnesota—who campaigned on a platform of "no foreign entanglements."

The 1944 election also carried a warning to the Democrats. It demonstrated that the personality and political genius of only one man—Franklin D. Roosevelt—could cement two wholly hostile and incongruous groups within their party. Relying on the sentimental support of the conservative, even reactionary south, Roosevelt directed his appeal to union labour and liberal elements north of the Mason and Dixon line. So wholeheartedly did they respond that he would have been re-elected easily even without the south's 127 electoral ballots.

Off-year elections in 1945 were scattered and confined to local battlegrounds, but they showed a trend which became more marked with the end of World War II. They indicated a slight defection from the Democratic party as represented by the Truman administration. It was a natural reaction, perhaps, to a political regime which had held power for so long, to the end of the patriotic and emergency pressures of World War II and to the disappearance of such a magnetic leader as Franklin D. Roosevelt.

The voters began to show less respect for old-fashioned partisan and clubhouse ties. The late Roosevelt's gay and even whimsical spirit of political independence and irresponsibility, as well as the volcanic emergence of postwar harassments and problems which transcended party thought and boundaries, hastened and intensified this process of ballot-box bootlegging.

The most notable and permanently significant development, in the opinion of expert observers, was the new, vigorous and self-conscious aggressiveness of organized labour, especially the C.I.O. The unions had achieved a balance-of-power position in many populous industrial centres where, as they had done for Roosevelt in the 1940 and 1944 contests, labour majorities determined the outcome in electorally strategic states, and, therefore, in the nation.

The November mayoralty elections in Detroit and New York supported the politicians in these general deductions, especially with respect to labour's new political power and role. As great industrial and cosmopolitan centres, they served to supply some insight into the mental and emotional processes of the postwar voters.

In the automobile capital Mayor Edward J. Jeffries was re-elected for a fourth term over Richard T. Frankensteen, vice-president of the Automobile Workers of America, a C.I.O. union. It was organized labour's first attempt to elect one of its officials to such a high public office.

Mayor Jeffries, after what he called a "nasty fight," won by 57,000 in a total vote of 501,047, the largest number of ballots ever cast in a Detroit municipal election. Although local contests in Henry Ford's city were supposed to be conducted on a nonpartisan basis, Republican and Democratic conservatives united behind the mayor. Democratic National Chairman Robert Hannegan, the local Democratic organization and the C.I.O.'s Political Action committee supported Frankensteen.

The labour candidate suffered from the series of strikes which had closed many Detroit plants during the campaign. Nevertheless, he polled 215,000 votes, or enough to become the deciding factor in state or national contests in Michigan.

In New York the Democrats closed ranks to include Tammany hall bosses, the New Deal hierarchy and even James A. Farley, and recaptured city hall after 12 years of La Guardian exile. They named William F. O'Dwyer, erstwhile Brooklyn policeman and famed prosecutor of Murder Syndicate, Inc., as their candidate. The Republicans ran Judge Jonah Goldstein, a former Democrat, largely at the behest of Gov. Dewey.

In personal protest against both the regular slates, which he denounced as "reactionary," retiring Mayor La Guardia entered Newbold Morris, a brilliant and civic-minded member of the La Guardia cabinet.

It was a walkaway for O'Dwyer. He rolled up 1,119,225 votes against 434,050 for Judge Goldstein and 399,437 for Morris. It was the largest majority any Democratic candidate had ever achieved. The Republican vote was the smallest since 1917. The demonstration for Morris, who had neither political funds nor organization, was regarded as a tribute to the excellent and public-spirited administration which Mayor La Guardia, for 12 years, had given to the nation's greatest city.

The La Guardia-Morris demonstration, as well as the support he obtained from independent labour elements, had a deep effect on Mayor O'Dwyer. He apparently heeded Mayor La Guardia's analysis of the results as a "sentence of death on machine politics and control." Mayor O'Dwyer and Tammany politics were at loggerheads only a few months after he took office. Following the good government performance of the "Little Flower," his Democratic successor apparently aimed at the same high standards of municipal management.

The Republicans carried all three special congressional elections which were held after Truman entered the White House—in Montana, Illinois and New Jersey. Herbert E. Brownell, whom Gov. Dewey named as Republican national chairman in 1944, derived satisfaction from the Montana and New Jersey results because the Democratic standard-bearers ran on a "Support Truman" platform. Commenting on the 1945 tests of public sentiment, Brownell said: "When the votes were counted, our party retained practically everything it had before, and gained several strategic offices previously held by the Democrats."

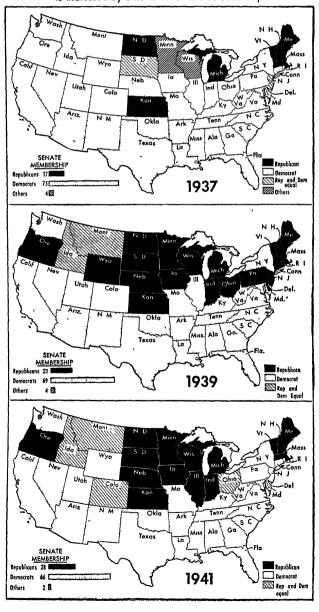

Among the notable political casualties of the turbulent year 1946 was the fall of the "House of La Follette," at least temporarily, with the result that no member of this distinguished Progressive brood, for the first time in more than 50 years, held high public office. The younger brother,

Philip, was defeated in 1940 when he sought a third term as governor of Wisconsin, and soon went off to war.

"Young Bob," sensing the decline of the Progressive cause and spirit in Wisconsin, disbanded the party which his father had founded, and announced his return to the G.O.P. But the conservative wing rebuffed his overtures and nominated its own candidate. Sen. La Follette then entered the Republican senatorial primary, but he was defeated by a narrow margin. His associates blamed his defeat on Milwaukee Communists, who retaliated for his outspoken senate attacks on Moscow's postwar program of aggression and nonco-operation with the western powers in the formulation of world peace.

Three other old-time Progressives and noninterventionists fell by the wayside in 1946 primaries. They were Sen. Burton K. Wheeler of Montana, Sen. Henrik L. Shipstead of Minnesota and former Sen. Gerald P. Nye

Maps showing composition of the U.S. house of representatives at the start of the 75th, 76th and 77th congresses. Senate membership is indicated by bars at lower left of each map

of North Dakota, who tried to make a comeback after his 1944 defeat. Although local issues and factors contributed to the trio's reverses, the outcome in this hitherto noninterventionist area was interpreted as additional evidence that the U.S. people favoured greater participation in world affairs.

The Shipstead setback appeared to strengthen the political stock of Harold E. Stassen, former governor of Minnesota, who had returned from his navy assignment as an avowed candidate for the Republican presidential nomination in 1948. As Wendell Willkie's floor manager at the 1940 Philadelphia convention and a Roosevelt representative to the San Francisco assemblage which gave birth to the United Nations, Stassen had fallen heir to the Willkie mantle. He was a "one world" apostle.

Stassen suffered a slight reverse when he backed Gov. Dwight Griswold of Nebraska against Sen. Hugh Butler, a leading noninterventionist, in that state's senatorial primary. Butler won easily. It had been expected that Stassen would make the run against Sen. Shipstead in Minnesota, but he entered his political protegé, Gov. Edward J. Thye. The Thye triumph over Shipstead placed Stassen in the 1948 race, along with such men as Gov. Dewey of New York, Gov. Warren of California, Senators Robert A. Taft of Ohio, Arthur Vandenberg of Michigan and John W. Bricker of Ohio.

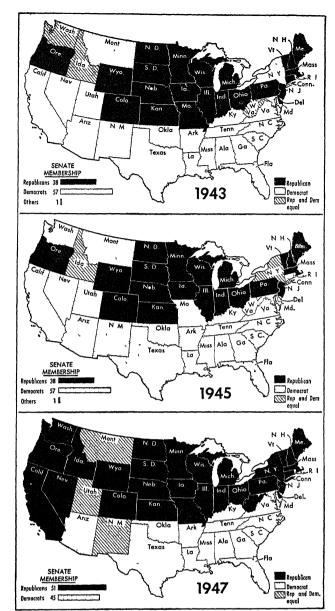

Meanwhile, the Democrats began to face internal difficulties and prospective disintegration. Rifts within the Truman administration, involving liberals and conservatives, Rooseveltian New Dealers and Truman loyalists, pro-soviet and anti-soviet factions, reflected the spirit of postwar political unrest and suspicion. Henry L. Morgenthau, for instance, quit his treasury post in a huff when he learned from Truman that his services would be wanted for only a few months.

Harold L. Ickes resigned as secretary of the interior after a sharp and sensational dispute with Pres. Truman over the latter's nomination of Edward W. Pauley, a California oil operator, to be undersecretary of the interior. Ickes charged that the president, in urging him to minimize his charges of lobbying and political bribery against Pauley, had asked him to sacrifice integrity for political expediency. Other Roosevelt holdovers were gradually replaced by men of Truman's preference, and it was generally agreed that the replacements were of a conservative rather than a liberal order.

These political emigrés, or many of them, immediately took to the writing of columns, magazine pieces and memoirs, to the radio and to formation of political organizations dedicated to the preservation and promulgation of Roosevelt's memory and program. Through their speeches and literature ran a thinly-veiled suggestion that Truman, by his appointments and policies, was deserting his predecessor's principles. Among those who gently chided the president were members of Roosevelt's own family, including Mrs. Roosevelt, James, Elliott and Franklin, Jr.

Two Roosevelt sons indicated that they intended to make politics a career, if possible. James became Democratic state chairman of California and joined with Harold Ickes in founding the Independent Society of Scientists, Artists and Professional Men. Franklin, Jr., was a leading figure in forming the American Veterans committee, a self-designated liberal organization of World War II G.I.'s.

It remained for unpredictable Commerce Secretary Wallace, however, to freeze Democratic politicians' spines. In mid-September, less than two months before the vital

Composition of the U.S. house of representatives at the start of the 78th, 79th and 80th congresses. Senate membership is indicated by bars at lower left of each map

congressional elections of 1946, he spoke at Madison Square Garden, New York, under the auspices of the C.I.O.'s Political Action committee and the Ickes-Roosevelt Society of Scientists, Artists and Professional Men. Wallace urged a go-easy policy toward Russia, and his remarks were regarded as a frontal attack upon Secretary of State James Byrnes' attitude vis-à-vis Moscow. At the moment Byrnes was attending the Paris Peace conference, where he was advocating and pursuing a strong course against soviet aggrandizement that was diametrically different from Wallace's proposals.

In the midst of his address Wallace paused to emphasize that Pres. Truman had read and approved his stated sentiments. At first the chief executive supported Wallace. But when state department officials openly expressed their indignation, and when reports from Paris suggested a possible Byrnes resignation, Truman qualified his earlier endorsement of the Madison Square Garden utterance. He explained that he had merely approved the minor

cabinet member's right to express his viewpoint for what it was worth.

Through a subsequent misunderstanding between Secretary Wallace and the White House secretariat, Wallace next made public a letter which he had sent to the White House in late July 1946. This document, whose publication Truman tried to halt in vain, virtually denounced the administration's whole policy toward Moscow and charged that certain U.S. army-navy officers were already planning a war against the soviet.

The ensuing uproar forced President Truman to ask for Wallace's resignation, which he submitted immediately. Inasmuch as the Iowan had been retained in the cabinet because of his supposed popularity among liberals of all varieties—C.I.O. unionists, New Dealers, pro-Muscovites, etc.—the summary dismissal of the "apostle of the abundant life" provided a new and severe headache for Democratic political planners.

Defeat of 1946.—The 1946 congressional campaign presented a strange spectacle. Largely because of his political (not personal) unpopularity and his own blunders, Pres. Truman did not participate except for a hurried trip to Independence, Mo., to vote. He delivered no speeches and gave no interviews on the journey. He was the "forgotten man" of the struggle.

In an unsuccessful effort to preserve the enthusiasm and the line-up of New Deal days, National Chairman Hannegan made records of excerpts from Roosevelt's most stirring addresses and mailed them to Democratic candidates for use at local rallies. This stratagem inspired hostile barbs that even he had "repudiated" the Truman administration.

Wallace's earlier invitation to tour the country under auspices of the Democratic national committee was quietly withdrawn after his break with the White House, and he spoke in a few places under the aegis of the C.I.O. and certain "liberal" organizations. Ill luck dogged him. He told a California audience that former Gov. Stassen was such a "great progressive" that the Republicans disowned him. In Minnesota he branded Stassen as a "pseudoliberal." In New York he shocked listeners by proclaiming that Sen. James M. Mead, the Democrats' candidate for governor, could not be elected.

The Democrats suffered another handicap when a Moscow radio commentator urged support of all the C.I.O. nominees, who were chiefly Democrats. The soviet intervention, although disavowed by the Democrats, pointed up G.O.P. charges that the party in power was "tainted with Communism."

The Republicans based their campaign on "the three C's," a phrase coined by National Chairman Carroll Reece to embrace the three issues of "communism, confusion and controls." As the results of Nov. 5, 1946, were to show, these three questions were uppermost in the voters' minds, in addition to their normal desire for a "change."

Many Democratic leaders blamed Pres. Truman for the sweep of their defeat in local and national contests. His temporary endorsement of the Wallace pro-soviet speech, despite his subsequent repudiation, estranged every racial group antagonistic to Moscow—the Irish, Poles, Germans, Scandinavians and Balkan peoples. Industrial centres heavily populated by these elements—once Democratic strongholds—were swept by the opposition.

Truman's shift on the question of continued OPA (Office of Price Administration) control of meat contributed to the Democratic debacle. After insisting for

months that price ceilings had to be maintained he lifted them on Oct. 14. When choice cuts returned to the market almost immediately, the voters apparently concluded that he had miscalculated in the first instance. His wavering on these important foreign and domestic problems appeared to destroy public confidence in all Democratic office seekers.

The Republican "landslide" on Nov. 5 exceeded even the experts' expectations. The G.O.P. regained control of congress after a 16-year exile. It won or held all the important governorships, winning a total of 25. It carried great cities which had not gone Republican after 1928. It outvoted the Democrats by more than 3,000,000, a tabulation which included the top-heavy Democratic vote in Dixie.

The Republicans increased their senate membership from 59 to 51. They won those 12 places in the following key states: Massachusetts, New York, Pennsylvania, Delaware, Ohio, Missouri, Wisconsin, Minnesota, Montana, Utah, Idaho and Washington. They 10st the senatorial races by narrow margins in West Virginia and Wyoming.

The opposition boosted its house strength from 192 to 246, with 188 for the Democrats and 1 member for the American Labor party. Of the Democrats' representation of 188, 116 came from southern and border states. Only 72 were from outside Dixie.

Several prominent Republican figures immediately became prospects for the 1948 presidential nomination by reason of their tremendous pluralities in key states. They included Gov. Thomas E. Dewey of New York, Gov. Edward Martin of Pennsylvania, who was elected to the senate; former gov. John W. Bricker of Ohio, who was also sent to the senate; Sen. Robert A. Taft of Ohio; and Gov. Earl Warren of California. Another was Sen. Arthur H. Vandenberg of Michigan, who won easily without making a campaign.

The prospect of a division between the executive and legislative branches led Sen. J. William Fulbright of Arkansas to propose that Pres. Truman turn the government over to the Republicans. He suggested that Truman name a Republican as secretary of state and then resign, thus permitting the G.O.P. cabinet member to succeed him. The scheme did not appeal to Truman. It did, however, measure Democratic dismay and discouragement at the outcome of the election. (R. Tu.)

Great Britain, British Commonwealth, Europe

World War II cast a long shadow before it, and the elections which were held in 1937-39 were dominated by two issues, the struggle of democracy versus political extremism, and policy in the event of war. In the British commonwealth, Australia, South Africa and Eire were considering rearmament and defense, and their attitude toward Great Britain should war occur. In Europe, democracy versus fascism was the main issue. In all countries economic questions were closely linked up with the world situation, trade agreements, currency problems, immigration, etc. During World War II elections expressed the solidarity of the peoples behind their leaders, in support of World War II in the case of the belligerent countries,

in support of democracy and against the forces of occupation in the case of some of the occupied countries, and in support of neutrality in Sweden. There was a tendency toward coalition governments as an expression of this unity. Criticism was mainly concerned with the administrative record of governments or aimed at a more vigorous policy rather than at direct opposition to government policy on matters of principle. Domestic issues took second place. After the end of World War II there was a resurgence of interest in domestic issues. In the countries which held elections, nationalization of industries was the biggest question. The elections were marked by the rise in importance of the Communist parties, particularly in France, Czechoslovakia, Bulgaria and Rumania. While the move to the left was general, as was strikingly shown in the British elections of 1945, the prevailing trend was toward social reform and socialism with a form of modified private enterprise, rather than toward a thoroughgoing communist state. Monarchy versus republicanism was an important issue in Belgium, Greece, Italy and Bulgaria. Clericalism versus anticlericalism played a considerable part in France and Italy, and to a lesser degree in Belgium, and in the confessional versus nonconfessional alignment in the Netherlands. Elections in the democratic sense were not held in Albania, Bulgaria, Estonia, Latvia, Lithuania, Poland, Portugal, Rumania, Spain or Yugoslavia during the period, the opposition either having been suppressed or having refused to support the elections.

Albania.—Elections were held on Dec. 2, 1945. The communist-sponsored Democratic Front was the only party presenting candidates, but independent candidates were permitted to stand. The Democratic Front secured 506,319 of the votes polled (93.18%) and all the 80 seats of the constituent assembly.

Australia.—Elections were held in Oct. 1937, Sept. 1940, Aug. 1943 and Sept. 1946, and a referendum was held in Sept. 1946.

On Oct. 23, 1937, the United Australia (Liberal) party won 28 seats, the Federal Labour party 20 and the United Country (conservative) party 17 seats. The main issue was defense. The government stressed co-operation with Britain and the importance of a bigger navy. Labour stood for freedom from foreign entanglements, self-reliance, local defense and a more powerful air force. Subsidiary issues were immigration and the removal of trade barriers. The Labour party placed greater stress on the protection of secondary industries and the limitation of immigration than did the government

On Sept. 21, 1940, the United Australia party suffered a setback: Labour won 32 seats, the United Australia party 23 and the United Country party secured 14 seats. All parties were united in support of World War II. The United Australia party and the United Country party had a common policy and appeal. The main issues were the government's administrative war record regarding gasoline rationing, subsidies to wheat growers and the terms on which the government acquired wheat from the growers.

On Aug. 21, 1943, the Labour party showed further gains, securing 49 seats, the United Australia party obtained 15 and the United Country party 10 seats. The election was fought primarily on the government's administrative war record, but with no major point of current war policy in question. Labour was attacked on bureaucratic methods and ill-conceived and overlapping administration.

On Sept. 28, 1946, the Labour party won 43 seats, the United Australia party 17 and the United Country party 12. The Labour party was against further large tax reduc-

tions. The opposition wanted strikes and lock-outs to be declared illegal and penalties enforced by a tribunal to be set up for the arbitration of disputes.

A referendum was held at the same time as the elections which sought to amend the constitution to give the commonwealth power to legislate on: (1) social benefits; (2) organized marketing of primary products; (3) conditions of employment in industry. The voting on (1) was 728,877 votes for and 584,486 against; on (2) 684,079 for and 622,850 against; and on (3) 657,426 for and 619,436 against.

Austria.—Elections were held in Nov. 1945 with the following results: People's (Catholic) party 85 seats, Socialists 76 and Communists 4. The main issue was right versus left. The socialists refused to fuse with the Communists and fight on a single list. The elections were regarded as in some sense a plebiscite on the issue "Russia versus the western powers."

Belgium.—Elections were held in April 1939 and Feb. 1946. On April 2, 1939, the Catholics (including Christian Democrats) won 73 seats, the Liberals 33, the Socialists 64, Rexists 4, Flemish Nationalists 17 and Communists 9. The Catholic party, still supporting a "freedom from alliances" policy, gained from the Rexists, who had held 21 seats in the previous election in May 1936.

In the first election after liberation, on Feb. 17, 1946, the Catholics (including the Christian Democrat party) still held the lead with 92 seats, the Socialists followed with 69; the Communists showed a large increase with 23 seats. The Liberals obtained 17. The Rexist and Flemish Nationalist parties were not represented. The main issues were domestic differences between the Socialists and the Communists on wage- and price-control policy. The Catholic party was opposed to nationalization. In the background was the Catholic support for a referendum on the return of the king.

Bulgaria.—Elections were held in March 1938, Nov. 1945 and Oct. 1946. On March 6, 13, 20 and 27, 1938, on the basis of the electoral law of 1937, 160 candidates were put up. Requirements were that they should be more than 30 years of age, neither Communists nor advocates of violent method. The vote was given to all males more than 21, and to all married women. There was no party organization. The election gave the government 104 and the opposition 56 seats in the parliament (Sobranje).

On Nov. 18, 1945, the Communist-sponsored Fatherland (Otechestven) Front gained 277 seats. The five parties forming the Fatherland Front put up a single list. The Agrarian Democratic and Independent Socialist parties which formed the opposition appealed to its supporters to boycott the election. According to the government, 86% of the electorate voted notwithstanding, and 80% of the votes were cast for the Fatherland Front. The elections were not recognized by Great Britain and the U.S.A. as having been free and the Bulgarian government was not recognized by these two powers.

A referendum on the monarchy was held on Sept. 8, 1946; 3,801,160 votes were cast for a republic, 197,176 for a monarchy, 119,168 votes were declared invalid; 91% of the electorate voted of whom 92.3% voted for the republic.

On Oct. 27, 1946, the parties representing the Fatherland Front won a total of 364 seats. They consisted of the Communists with 277 seats, the dissident Agrarians with 69 seats, the dissident Social-Democrats with 9, the Zveno Union (Army party) 8 and Radicals 1. The opposition parties obtained 101 seats. This election to shape the country's new republican constitution was not fought on a party program. The main issue was the methods of the

government. The opposition upheld personal liberty and the individual rights of the citizens and was particularly opposed to the control of the police by the Communists; opposition leaders declared that they took part in the election only to show that they were not afraid to enter the contest, and that there were sufficient irregularities to reduce the pro-Fatherland Front vote from 60% to 22%.

Canada.—Elections were held in March 1940 and June 1945. On March 26, 1940, the Liberal party had an overwhelming majority with 179 seats in a house of 245. The Conservatives secured 39, the New Democracy (including the Social Credit party) 10, the Co-operative Commonwealth Federation (the Labour party of Canada) 8 seats. All parties were united in support of World War II. The Conservatives criticized the government's war effort as not vigorous enough. They pressed for a "national" government or coalition. There was criticism from the left of the rigour with which Canadian defense regulations were being enforced. Suppression of free opinion was alleged.

On June 19, 1945, the Liberal party led with 119 seats but showed a decline. The Conservatives won 65 seats, the Social Credit party 13 and the Co-operative Commonwealth Federation made a striking advance with 28 seats. The main issue was conscription for war against Japan. The Conservatives supported conscription, the government was against it. Domestic reconstruction came to the front, the Co-operative Commonwealth Federation supporting nationalization of some industries and a greater degree of public control over others.

Czechoslovakia.-Elections were held in May 1935 and May 1946. On May 19, 1935, at the last prewar elections the political parties were returned to the chamber of deputies (300 members) as follows: National Unity 17, Agrarians 45, Traders 17, Czech Populists (Catholics) 22, Czechoslovak National-Socialists (Dr. Eduard Beneš's party) 28, Czechoslovak Social-Democrats 38, Communists 30, Fascists 6, Slovak Populists (Catholics) 22, German Henlein party 44, German Social-Democrats 11, German Agrarians 5, German Christian-Social party 6, Hungarians 9. In the elections to the senate (150 members), held on the same day, the results were as follows: National Unity 9, Agrarians 29, Traders 8, Czech Populists 11, National-Socialists 14, Social-Democrats 20, Communists 16, Slovak Populists 11, Henlein party 23, German Social-Democrats 6, German Christian-Social party 3, Hungarians 6.

After the liberation only four political parties in Bohemia-Moravia and four in Slovakia were allowed to exist legally. The Czech National and Agrarian parties and the Slovak Populist party were banned on account of their collaboration with the Germans. The general elections were held on May 26, 1946, and the distribution of seats in the constituent assembly (300 members) was as follows: Bohemia-Moravia: Populists 46, National-Socialists 55, Social-Democrats 37, Communists 93; Slovakia: Freedom party 3, Christian-Democrats 43, Labour party 2, Communists 21. The election represented a test of strength between eastern and western concepts of democracy. All parties agreed on nationalization measures, expulsion of minorities and the need for maintaining a coalition gov-The Populists and the National-Socialists favoured slower nationalization and more limited expulsion of Sudeten German skilled workers.

Denmark.—Three elections were held: in April 1939, March 1943 and Oct 1945.

On April 3, 1939, the Social-Democrats led with 64 seats in the lower house (Folketing), followed by the

Liberals with 30, the Conservatives with 26 and the Radicals with 14; 3 Communist candidates were also returned. The election of 1939 represented a struggle for power between coalition parties in the government, Labour and the Radicals. The government was in favour of the abolition of the upper house. In South Jutland (North Schleswig), on the frontier, there was a clash between the German (nazi) party and the Danes.

On March 23, 1943, the results followed very closely those of the previous election. The Social-Democrats again led with 66 seats, the Conservatives secured 31, the Liberals 28 and the Radicals 13 seats. This election was a demonstration of support for democracy and evidenced the defeat of nazi-dominated parties. All nazi parties presented themselves as the "United parties" and asked the electorate to vote for them, but they polled only 3.5% of all the votes. The electoral defeat of naziism was followed by the suspension of the cabinet on Aug. 29, 1943.

On Oct. 30, 1945, the Social-Democrats lost ground relatively while maintaining their lead with 48 seats; the Liberals won 38, the Conservatives won 26, the Radicals 11 and the Communists made a strong showing with 18, becoming a considerable party for the first time. Controversy centred on nationalization. There was a struggle between the Farmers' party (Liberals) and the Social-Democrats. Other issues were the frontier in South Jutland, the lowering of the age of franchise and the future of the upper house.

Eire.—Four elections were held: in July 1937, June 1938, June 1943 and May 1944.

On July 1, 1937, Fianna-Fáil, the government party, led with 69 seats in the Dáil Eireann; United Ireland (Fine Gael), the opposition, followed with 48; Labour secured 13; the Independents 8. The issue in 1937 turned on the economic results of Eamon de Valera's government and commonwealth relations. William T. Cosgrave, leader of the opposition, was in favour of ending the economic war with Great Britain. Approval of the constitution was not a controversial issue.

On June 17, 1938, De Valera's party, Fianna Fáil, held 77 seats; United Ireland lost 3 seats, securing 45; Labour and Independents also lost securing 9 and 7 respectively. The election was precipitated by De Valera's desire to gain a working majority in the Dáil instead of being dependent on the support of the Labour party. An arbitration board for the civil service was proposed by Labour and opposed by the government. Cosgrave attacked the Anglo-Irish agreement on its defense clauses and on the grounds of increased taxation involved in the upkeep of the defense ports.

On June 22, 1943, Fianna Fáil's representation fell to 67 seats and Fine Gael's to 32; the Labour party gained, securing 17 seats and Independents secured 8 seats; and the Farmers' party (Clann na Talmhan) increased from 1 to 14. Neutrality was not an issue. Personalities rather than politics dominated the scene. There was a challenge from Labour on wage and price control. Cosgrave put forward a plan for a national (coalition) government.

On May 30, 1944, Fianna Fáil won 76 seats, Fine Gael 30, the Farmers' party 9, the Labour party 8, National Labour 4 and Independents 11. The election followed the defeat of the government over the transport nationalization bill. Fine Gael stood for closer co-operation with Great Britain and the commonwealth. All parties were agreed on a policy of neutrality. Fine Gael called for a coalition government, but De Valera opposed this and

stressed the need for a strong government.

Finland.—Elections were held in July 1939 and March 1945. On July 1 and 3, 1939, the election to the diet (Eduskunta) followed the main lines of the previous election of July 1936 in which democracy versus fascism (represented by the I.K.L. or National Patriotic movement) was the main issue. The 1939 election represented a victory for the government bloc of Social-Democrats (85 seats), Agrarians (56) and Liberals (6); the National Coalition (Conservative) party won 25, and the Swedish People's party 18 seats. The I.K.L. declined to 8.

On March 17–18, 1945, at the first postwar election, the greatest gains fell to the newly formed Democratic People's Union, comprising those Social-Democrats who op posed the party's anti-soviet policy, the Small Farmers' party and the Communists. Out of 200 seats the People's Union won 49, the Social-Democrats kept 50 and the Agrarians 49; but the Liberals gained 9 and the Con servatives 28; the Swedish party retained 15. While all parties agreed on the necessity for establishing goodneighbourly relations with the U.S.S.R., there was a serious difference of opinion between the People's Union and all the other Finnish parties as to the best methods to achieve that aim.

France.—During the period 1937–46 three elections were held, all after the liberation, viz., in Oct. 1945, June 1946 and Nov. 1946. Those of Nov. and Dec. 1946 were held to elect the council of the republic, the new upper chamber taking the place of the former senate. Three referenda were held: in Oct. 1945, May 1946 and Oct. 1946.

On Oct. 21, 1945, the chief characteristic was the neckand-neck struggle between the Communists, who secured 146 seats, and the Catholic M.R.P. (Mouvement Républicain Populaire), which secured 142 (out of a total of 592). The Socialists followed with 133. When closely allied groups were added, the proportion was even more equal -152, 142 and 142. The Radicals won 25 seats as a group, and the old Conservatives about 70. The Socialists and Communists differed mainly on their attitude to soviet Russia. The main issue was the conflict between the M.R.P. and the Communists. A further issue was the attitude of the electors for or against Gen. Charles de Gaulle. All parties of the Resistance movement supported a program of nationalization of basic industries. A referendum was held at the same time as the elections to decide (1) whether the national assembly should be a constituent assembly, and (2) whether a certain provisional constitution should be accepted. The M.R.P. and the Socialists voted "yes" on both questions, the Communists were in favour of the first but not the second, and the Radicals were against both. The results of the referendum were as follows: first question: 15,656,283 "yes" and 596,743 "no"; second question: 10,847,925 "yes" and 5,381,106 "no."

On May 5, 1946, a referendum was held on the draft constitution. The M.R.P. was against it, favouring a stronger upper chamber and wider powers for the president of the republic. Socialists and Communists supported it. The draft constitution was rejected by 10,488,059 "no" against 9,327,073 "yes"; majority against, 1,160,986.

On June 2, 1946, a second constituent assembly was elected. The election campaign hinged increasingly on the issue for or against communism. The Communists won 150 seats (with an affiliated group), the M.R.P. rose to 163; the Socialists obtained 128, showing a relative decline; the Radicals (appearing, with affiliated groups, as the R.D.G. or Rassemblement des Gauches) won 47 seats. The Republican party of Liberty (P.R.L.) and other right wing parties obtained 67 seats. Other issues of the cam-

French nuns at the polls for the referendum vote on the proposed French constitution, May 5, 1946. Balloting was heavy and the vote very close; the constitution was defeated by little more than 1,000,000 votes out of the approximate 20,000,000 cast

paign were the government's record regarding the budget, wages and price control. There was controversy over the methods and the extent of nationalization. Catholic support was put forward for religious education (although the M.R.P. did not adopt this in their program).

In the referendum that was held on the new draft constitution on Oct. 13, 1946, the voting in France proper, Corsica and the three départements of Algeria, was as follows: voters on register 25,379,917, votes cast 17,441,033, in favour 9,120,576 (52.3% of votes cast, 39.9% of voters on register), against 7,980,333, abstentions 7,938,884 (31.28%).

On Nov. 10, 1946, the constitution having thus been adopted, elections to the national assembly were held. The Communist party showed a new relative gain and secured 182 seats out of 619, the M.R.P. obtained 172, the Socialists declined to 101. The right wing groups and the R.D.G. both increased their strength—the former obtained 85 seats, the latter 69. At these elections 23 more seats were given to metropolitan France and four more to Algeria than in the previous elections. The Communists regained their former position of leading party. Opinion crystallized to the left and right, and "middle-of-the-road" Socialists suffered a decline.

On Nov. 24, 1946, preliminary elections were held for the creation of an upper chamber, the council of the republic, which with the national assembly was to join in electing the president of the republic. Out of a total of 18,022,223 votes cast, the Communists secured 29%, the Socialists 16.7%, the M.R.P. 26%, the R.D.G. 8.2%, the right wing groups 7.7% and various small groups, often nonpolitical, 12.4%. On that day about 84,600 grands électeurs were elected. On Dec. 8 the grands électeurs, together with local conseillers-généraux and the deputies in the assembly for that département (administrative subdivision of France) voted for 200 metropolitan and 14 Algerian members of the council of the republic. The distribution of seats was as follows: Communists 61, Socialists 37, R.D.G. 25, M.R.P. 62, right-wing groups 20, left Independents 2, Algerian Moslems 7. The remaining 101 seats were distributed later, and for these the national assembly elected 42 councillors on Dec. 20.

By the new procedure it was hoped to avoid the opposition between a conservative senate and a radical chamber, a characteristic product of the 1875 constitution. Measures passed by a majority of the assembly were to be passed by a majority of the council. Neither the Communists nor the Socialists desired the creation of a second chamber, and the new, constitutional arrangement was in the nature of a compromise.

Germany.—Although no national elections took place in occupied Germany, local elections were held in Sept. 1946 for borough and parish councils. In the British zone independent candidates gained the largest number of seats. The Christian-Democrats led with more than 20,600; the Social-Democrats got 16,000 seats; the Communists less than 700 seats. In the French zone the Christian-Democratic Union led with 1,273,574 votes; Social-Democrats polled 563,507; Communists 180,466; Democrats 87,015; others 637,849. In the Russian zone in Mecklenburg the Socialist Unity (Communist) party gained 69% of the poll, the Christian-Democrats 16% and the Liberal-Democrats 10%. In Brandenburg the Socialist Unity party got 820,600 votes; the Christian-Democrats 259,038; Liberal-Democrats 236,287, other groups 52,942. On Oct. 21, 1946, municipal elections in Berlin gave the Social-Democrats 999,170 votes (48.7%), the Christian-Democrats 454,202 votes (22.1%), the Socialist Unity (Communist) party 405,992 (19.8%), the Liberal-Democrats 192,527 (9.4%). In all 20 boroughs of Greater Berlin, Social-Democrats were the leading party. Between 90% and 95% of the electorate voted.

Great Britain.—The election held on July 5, 1945, was the first since 1935. Out of 640 members, the Labour party gained a majority with 393 seats (instead of 163 at the time of dissolution), the Conservatives held 197 (instead of 373), the National Liberals 13, the Liberal party 11. The Conservatives attempted to fight the election mainly on the war record of the national (Coalition) government and Winston Churchill's part in it, the war with Japan and "government interference" in private enterprise. The Labour party stressed social security, full employment, state medical service and nationalization of the principal industries.

Greece.—For the first time since Gen. John Metaxas' coup d'état in 1936, a free election was held on March 31, 1946; a referendum was held on Sept. 1, 1946.

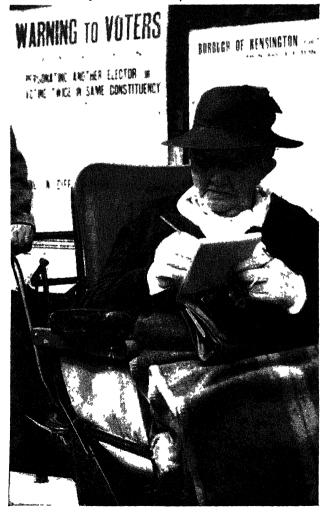

The main issue in the election was monarchy versus republic and right versus left. The Populist (Royalist) party

gained a large majority, with 206 seats (out of 354), the National Political Union (a coalition of three small republican parties led by Sophocles Venizelos, George Papandreou and Panayotis Kanellopoulos) secured 68, the Themistocles Sophoulis Liberals 48, National Resistance (Colonel Napoleon Zervas) 17, the Independents 11.

On Sept. 1, 1946, a referendum was held to settle the question whether Greece should have a republican or monarchical government: 1,691,592 votes were cast, of which 1,170,470 were for the monarchy. There were 346,862 blank voting papers, and of the 176,224 republican votes, 3,813 were cancelled. The blank papers and the republican votes against the king's return totalled 523,086. Out of 1,861,146 registered electors, 90.9% voted, of whom 69.3% were in favour of the monarchy.

Hungary.—Two elections were held, in May 1939 and in Nov. 1945. On May 28–29, 1939, the government Hungarian Life party gained a large majority with 186 seats (out of 260); the Arrow Cross (tascist) party followed with 29, the Smallholders' party 14, Liberals 5, Social-Democrats 5, Christian Union 3, four dissident fascist parties 11, Independents 7. The issue was democracy versus fascism. The government was guardedly anti-fascist and pro-democracy. The fascists were pro-German and anti-semitic. The

A disabled Englishwoman marking her ballot in Kensington during the general elections of July 1945. The aged and infirm of that district were brought to and from the polls at Queen's Gate Gardens

left parties supported democracy against the fascists and stressed land reform.

On Nov. 4, 1945, the Smallholders' party gained a large majority with 245 seats (out of 409); the Social-Democrats 70, Communists 69, the National-Peasant party 23. These four parties, forming a coalition, were committed to nationalization measures and land reform. The slogan of the Smallholders' party was "liberty, religion and individual rights."

India.—On July 25, 1946, the results of the elections to the constituent assembly were announced. Out of a total of 385 seats, 210 were allotted to general constituencies, of which the Congress party gained 201, ensuring it an absolute majority in the house; among the Congress members elected were 25 representatives of the depressed classes, 7 Christians, 3 Anglo-Indians and 12 women. The Moslem league gained 73 out of the total of 78 seats allotted to Moslems. The four seats reserved to the Sikhs remained unfilled, as the latter boycotted the elections. Finally, 93 seats remained to be filled by the Indian states.

Italy.—The first elections after the overthrow of the fascist regime were held on June 2, 1946. The return of freedom showed itself in a welter of parties. The Christian-Democrats led with 207 seats (out of 556), the Socialists following with 115 and the Communists with 104; the National-Democratic Union (Liberals) gained 41; a new party, Uomo Qualunque, won 30; the Republicans 23, National Freedom Bloc (Monarchists) 16, Action party 7 and other lists 13. The chief issues were monarchy versus republic, and clericalism versus anticlericalism. Land reform and the extent of public control in the economic field were other important issues.

Simultaneously with the general elections to the constituent assembly, a referendum on the "institutional question" was held: 12,717,923 votes were cast for a republic against 10,719,284 for the monarchy; there were 1,498,136 invalid papers.

Netherlands.—Two elections were held, in May 1937 and in May 1946. On May 26, 1937, in the second chamber of the states-general, the Roman Catholic People's party secured 31 seats (out of 100), the Anti-Revolutionary (Conservative) party 17, the Christian Historical (Protestant) Union 8, Liberals 4, Liberal-Democrats 6, Christian-Democrats 23, Communists 3 and National-Socialists 4. The main issue lay between democracy and the political extremism of nazis and communists. Speed of rearmament was another important issue. The Socialists were against the deflationary policy favoured by the government and advocated more borrowing and spending.

On May 17, 1946, the first election since liberation saw the Roman Catholic party still leading with a narrower margin over the Social-Democrats: 32 seats as against 29; the Anti-Revolutionary party had 13 seats, the Communists 10, the Christian Historical Union 8, the Freedom (Liberal) party 6 and the State Reform party 2. The National-Socialists were disbanded; the Liberal-Democrats and the Christian-Democrats fused with the Social-Democrats. The three confessional parties and the nonconfessional parties were broadly aligned against each other. The Roman Catholic People's party supported social reform but was anti-Socialist. The Indonesian policy of the government was opposed by the Anti-Revolutionary party.

New Zealand.—Three elections were held: in Oct. 1938, Sept. 1943 and Nov. 1946.

On Oct. 15, 1938, the Labour party won 53 seats, the National (Conservative Farmers') party 25 and the Independents 2. The issue at the election was private enter-

prise versus the increasing amount of state control.

On Sept. 25, 1943, the Labour party led with 45 seats but had lost relatively to the National party with 34; there was one Independent. All parties were united in support of World War II. The issues were exclusively domestic, chiefly land legislation and internal marketing policy. Conservatives favoured producer control of prices and marketing, instead of government control. There were allegations against extravagance in war administration.

On Nov. 27, 1946, Labour dropped to 43 seats while the National party advanced to 37 seats. This election was again on domestic issues. Both parties were agreed on controls, but the National party favoured lower taxation, a modification of the means test for pensions and a greater measure of marketing control by producers while retaining bulk marketing and guaranteed prices for the export producer. Labour was charged with yielding too readily to trade union pressure.

Norway.—An election to the Storting was held on Oct. 8, 1945. The results were as follows (party strengths in the former Storting elected in 1936 being shown in parentheses): Labour party 76 (70), the Conservative party 25 (36), Liberals 20 (23), Communists 11 (nil), Agrarians 10 (18) and the Christian People's party 8 (2). The issue was private enterprise versus state control. The Agrarians lost ground partly because of their poor record in the resistance movement.

Poland.—An election held to the lower chamber (Sejm) on Nov. 6, 1938, resulted in 67% of the electorate recording their vote despite the opposition's boycott of the elections. The National Unity camp (Oboz Zjednoczenia Narodowego), from which the government drew its support, had 161 of the 208 seats; 19 seats went to the Ukrainians, 5 to the Jews and the remainder to independent candidates. The leaders of the opposition parties -the Socialist, the National Labour (Christian-Democrats), the Populist (Peasants) and the National party-also urged the boycott of the elections of Sept. 8, 1935, in which year only 47% of the electorate polled. In 1935, as in 1938, the boycott was called in protest against the electoral law of July 8, 1935, a complicated elite system which enabled the government to influence the voting. The total electorate, which included all men and women more than 24, numbered approximately 17,400,000. On Nov. 13, 1938, 64 senators, comprising two-thirds of the senate, were chosen by the electoral commissions (consisting of "citizens of meritorious service") whose function it was to elect the senators. The remaining 32 senators were appointed by the president of the republic.

After the liberation, the Russian-sponsored provisional government resisted for almost two years the demand of the British and U.S. governments to carry out the international agreement of Yalta and to hold "free and unfettered elections" as soon as possible. An election was finally fixed for Jan. 19, 1947. In the meantime a referendum took place on June 30, 1946. The Polish electorate had to answer the three questions: (1) Are you for the abolition of the senate? (2) Are you for making permanent the economic system instituted by land reform and nationalization of basic industries? (3) Are you for the Oder-Neisse frontier? The Polish Peasant party, the only party so far allowed to fight openly for true democracy, decided to vote "no" to the first question in order to count all the electors opposed to a regime controlled by the Communist party. According to Stanislaw Mikolajczyk, leader of the Peasant party, 83.5% of the electorate voted "no" to the first question. The regime, however, published after a delay of 12 days completely different results, according to which the answers to the first question were 7,844,522 "yes" and 3,686,029 (32%) "no."

Rumania.—Elections were held in Dec. 1937, June 1939 and Nov. 1946.

On Dec. 20, 1937, the National-Liberal (Conservative) party, the government cartel, obtained 152 seats; the National-Peasant party (which had an electoral pact with the fascist Iron Guard of C. Z. Codreanu) 86; the Iron Guard 66, the National-Christian league 39 and the dissident Liberals 16. The Hungarian Peasant party secured 19 seats and the Radical Peasant party 9. The chief issue was the unpopularity aroused by the National-Liberals after four years in power and the increasing strength of the fascist movement.

On Feb. 27, 1938, all political parties were abolished by a new authoritarian constitution promulgated by King Carol II. On June 1 and 2, 1939, elections were held to a corporative assembly of 258 members in which three social classes—(1) intellectual professions, commerce and industry, (2) agriculturalists and (3) labour—were each equally represented.

On Nov. 19, 1946, the Communist-sponsored Democratic Front won 348 seats; the National-Peasant (chief opposition) party obtained 32, the National-Liberal party 3, the Popular Hungarian Union 29 and the Democratic Peasant party 2 seats. The government seats were made up of 73 Communists, 75 dissident Liberals, 75 Social-Democrats, 70 Ploughmen's Front, 26 National-Popular party, 20 dissident National-Peasants, etc. According to the official figures (contested by the opposition) the government parties obtained 84% of the votes. Notes were sent by the British and U.S. governments protesting the conduct of these "elections."

Sweden.—Elections were held in Sept. 1940 and Sept. 1944. On Sept. 15, 1940, the Social-Democrats led with 134 seats, the Conservatives secured 42, the Agrarians 28, the People's party 23 and the Communists 3. At this election, a "gentlemen's agreement" was made between the parties represented in the National Union government (formed during the war crisis) to avoid violent campaigning. The election results were an endorsement of the Social-Democrats' policy of neutrality and independence. Their critics wanted more help given to Norway and Finland.

On Sept. 15, 1944, the Social Democrats still held the lead with 115 seats, the Conservatives secured 39, the Agrarians 35, the People's party 26 and the Communists 15 seats, a large increase. The election was dominated by domestic issues, in particular economic reconversion policy after the war. The Communist party attacked the government's wage policy and its past policy toward Germany.

Switzerland.—Elections were held in Oct. 1939 and Oct. 1943. On Oct. 29, 1939, out of a total of 187 seats, the Radical-Democrats secured 50, Social-Democrats 45; Catholic Conservatives 44, Agrarians 21, Liberals 6, Independents 9, other parties 12. Candidates were chosen by mutual agreement of the parties. There was no voting except in isolated cases.

On Oct. 31, 1943, the Social-Democrats made a bid for more power and obtained (out of a total of 194 seats) 54 seats; the Radical-Democrats held 47, Catholic Conservatives 43, Agrarians 22, Liberals 8, Democrats 6, other parties 14. The Socialists claimed improved social legislation and a more liberal foreign policy.

Turkey.—Elections were held in March 1939, Feb. 1943 and July 1946. On March 26, 1939, the Republican Peo-

ple's (government) party won 399 seats out of a total of 424 members of *Kamutay* (or grand national assembly); the independent group of the People's party, a group of "benevolent critics" of the government formed from among the ranks of the government party itself, won 21 seats. There were four representatives of national minorities.

On Feb. 28, 1943, the Republican People's party won 416 seats; the independent group of the People's party 1aised their number of seats to 35.

On July 21, 1946, the election for the first time took place on a basis of universal suffrage and genuine party warfare. The government party obtained 395 seats, the Democratic party (formerly independent group of the government party) 62 and the Independents 7. The main contest was between the government party led by Recep Peker and the Democratic party led by Celal Bayar. These two parties agreed on their attitude to Russia but disagreed on internal policy.

These were the first reasonably democratic elections to be held, although the Democratic party complained of violence and terrorism being used against it.

Union of South Africa.-Elections were held in May 1938 and July 1943. On May 18, 1938, the United party of South Africa (led by Gen. J. C. Smuts and Gen. J. B. M. Hertzog) won 111 seats, the Nationalist party (D. F. Malan) 27, the Dominion party (Col. C. F. Stallard) 8, the Labour party 3 and the Socialist party 1 seat. The parties were sharply divided. The Malanites were anti-British, anti-Jewish, anti-Asiatic and anti-native in their policy. They supported republicanism. On the domestic side they wanted gold mining more heavily taxed and more help for the white farmers. In the foreign field they demanded a neutrality declaration in the event of war. The United party opposed the Nationalists' policy on the grounds that it would lead to civil war. The United party stood for South African interests but opposed violent nationalism. It was pro-British in maintaining a policy of support for Great Britain in case of war.

The Dominion party appealed exclusively to the British element in South Africa. It stood for a more liberal native policy.

In the election on July 7, 1943, the United party had made a truce with the Labour and Dominion parties, while some of the followers of Gen. Hertzog and the followers of Dr. Malan had joined to form the Reunited Nationalists. The issue was for or against South African support for World War II, with neutrality as the alternative. The Nationalists raised the communist bogie. The United party won 89 seats, the Reunited Nationalists 43, Labour 9. The Dominion party won 7 seats, its program calling for whole-hearted support for Great Britain.

Yugoslavia.—Elections were held in Dec. 1938 and Nov. 1945. On Dec. 11, 1938, the government party led by Dr. Milan Stoyadinovitch (Yugoslav Radical Union) won 306 seats and the united opposition led by Dr. Vladimir Matchek 67. In this election to the Shupshtina (chamber of deputies) the opposition made progress against the government's dictatorship. In general, the Serbs supported the government and the Croats the opposition. The Yugoslav Nationalists joined the opposition. Serbo-Croat negotiations for a federal state were an election issue.

On Nov. 11, 1945, in the first postwar elections the Communist-sponsored National Front returned 575 representatives. One representative was chosen for every 50,000 electors.

The opposition refused to take part in the election;

according to the government, only 10% of the votes were cast against the National Front.

Electrical Industries

From 121,837,000,000 kw.hr. in 1937, production of electricity for public supply in the United States almost doubled to 230,649,000,000 kw.hr. in 1944. Of this increase in annual production, about two-fifths occurred in the years before U.S. entry into World War II. There had been a decrease to 116,681,000,000 kw.hr. in 1938. Thus, in round billions of kw.hr., in the 3 years preceding the attack on Pearl Harbor, there was an increase in annual electricity output of 51, while in the 3 war years to 1945 the increase was 62.

These figures show that the rise to the high of 1914 was not so rapid as might be supposed, that the increases of the war years were actually only an acceleration of a trend already established during the defense period between Hitler's move into Poland in 1939 and the Pearl Harbor attack in 1941.

During the months of war in 1945, weekly outputs of electricity remained consistently above those of the same weeks of 1944, indicating that the record high of the earlier year would have been exceeded had the war continued. In the last 5 months of 1945, output dropped precipitately and remained down until the summer of 1946, when it began to climb, reaching 4,521,000,000 kw.hr. for the week ending Sept. 14, a figure significantly higher than the 4,395,000,000 kw.hr. for the corresponding week of the record war year of 1944. This remarkable recovery from the natural postwar letdown and the disturbing series of labour difficulties following it, indicated the resilience of the national economy.

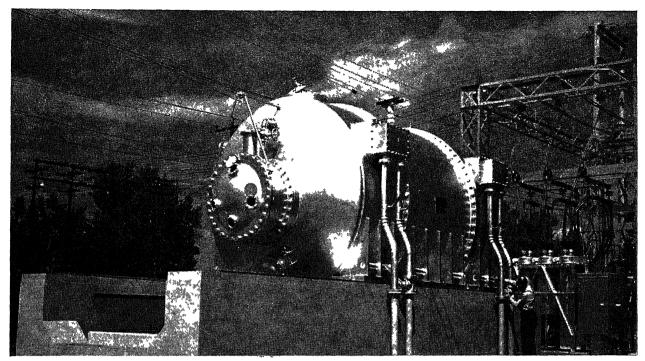

In the years of the decade 1937–46, production of electricity from water power ranged between 30% and 40% of the total, reaching its highest proportion in 1938, the year of lowest production in the decade, and dropping to its lowest proportion in 1944, the year of highest production. This circumstance pointed up the comparative inflexibility of water as against fuel power in ability to respond to energy demands.

Basically, energy from water power is determined by the weather and is outside of human control, while energy from fuel is a matter of human effort in extracting fuel from the earth.

Production of electricity in government-owned plants, federal, municipal and power district, and in those of co-operatives, increased rapidly during the ten years. In 1937 the proportion was 7% and in 1945 was 19%. The greater part of the increase occurred in the second half of the decade, when the demand of war for metals, particularly for aluminum, was largely met by energy from federal hydroelectric projects.

The biggest jumps occurred in 1942 and 1943, each about 3%.

The decade was marked by three advances in electricity production. One, the least spectacular of the three but easily the most important, was the continuing increase in steam pressures and temperatures, notably exemplified in the 2,500 lb. 940° F. installation at the Twin

Synchronous condenser cooled by hydrogen, installed in 1941 at Denver, Colo.

Branch plant of the Indiana-Michigan Electric company in 1941, and the 1,500 lb. 1,050° F. unit ordered in 1946 for the Sewaren plant of the Public Service Electric and Gas company.

Second of the developments was the gas turbine, which was brought well inside the range of practicability by advances just before and during the war years. The gas turbine avoided the necessity for boilers and for steam and water piping, because it applied the heat of combustion directly to turbine rotation; but it required air compression equipment that made large demands on the energy output of the machine. Developments to the end of the decade indicated that the gas turbine would have a more immediate field in traction and ship propulsion applications than in stationary installation for electricity production.

Third was atomic power, on which more nonsense was fed to the public than on any other technical development in history. It was probably safe to say, in the light of knowledge at the decade's end, that every popular idea on power production from atomic fission, in terms of ordinary utilization of energy, was wrong. There was no ground for believing that steam and gas turbines, water wheels and internal combustion engines would be superseded by atomic energy machines in the immediate future, nor very soon after that, either. One authoritative guess was that it would take from 10 to 30 years. The problems of unit and plant design and of economy were tremendous, and their solutions would come only from time-consuming calculation, experiment and trial. Pre liminary and entirely theoretical explorations into the potentialities of atomic fission for power production indi cated that coal would have to double in price, at least, before atomic energy would approach a competitive position as against the steam turbine. A report prepared under the direction of Charles A. Thomas, Monsanto Chemical company, published in Sept. 1946, stated a necessary investment at postwar costs of \$334 per kw. of capacity for an atomic energy plant as against \$133 per

kw. for a steam plant; also that equality of operating costs between the two kinds of plants would not be reached until the price of coal rose to \$10 per ton.

Capacity.—Although new generating capacity of approximately 18,000,000 kw. was installed by U.S. electric utilities in the period 1937-46, total capacity increased only from 37,134,382 to about 51,000,000 kw. The difference between new capacity installed and increase in total capacity, some 4,000,000 kw., was accounted for by retirement of old machines. During the 5 prewar years 1937-41, the proportion of new replacing retired capacity was about 22%. But in the 3 war years, 1942-44, the proportion was only 15%. These two ratios showed how machines were kept in service beyond retirement age in order to help carry the war load. This point appeared even more strikingly in the fact that in 1945, although new capacity of 888,400 kw. was installed, the total capacity shrank from 50,275,377 to 50,102,442 kw. In that year of the war's end, retirements amounted to more than new capacity installed.

U.S. hydroelectric generating capacity had a large increase in the ten-year period, but the coincident increase in fuel power generating capacity was in proportion. The result was that at the end of the period the respective proportions of the 2 ways of production in the total, 30% hydro, 70% fuel power, were the same as in 1937.

In 1937, about 11% of the total generating capacity was government-owned. In 1946, the proportion had risen to more than 20%. Practically all of the increase was accounted for by federal water power projects.

A significant addition to effective electricity production capacity, estimated as high as 1,000,000 kw., was made during the war years by an acceleration of transmission line interconnections between plants and systems. Such interconnections were old in the history of the industry, but before the war they had been made primarily for reasons of operating and investment economy. But the war reversed these considerations, and it was quickly realized that the building of some miles of transmission line could readily avoid the fabrication and installation of electricity production equipment, thus freeing manufac-

turing facilities for the more urgent production of war goods.

During the period 1937-46, U.S. electric utilities saw two predictions concerning them go entirely wrong One, before the war and in its first years, was that it would not have sufficient capacity to meet demands. This prediction was made first in 1935 by the Federal Power commission. The statement then was that recovery from the depression would find the nation short by more than 2,000,000 kw. in generating capacity. The commission continued to predict shortages that never came up to July 1941, when it officially recommended installation of 13,-540,000 kw. as needed in the years 1943-46 inclusive. Capacity actually scheduled by the Office of War Utilities in those years was 6,203,000 kw., a sufficient addition to meet war demands. The difference of more than 7,000,000 kw., had it been installed, would have interfered seriously with the war effort.

In 1942, the chairman of the Federal Power commission, in a confidential report to the president, said that the Office of War Utilities had underestimated the war load by 10,000,000 kw. and overestimated the capacity available to meet that load by 1,500,000 kw. The OWU apparently convinced the president that its appraisal of the situation was correct, for from then on it had no interference from the FPC in its wartime control of electricity supply. Thus was the prediction of insufficient capacity proved wrong.

The other prediction, made as the war neared its end, • was a generally expressed feeling that there would be a great surplus of generating capacity in the postwar period. This, also, turned out to be wrong. Although there was a decrease in industrial requirements of electricity, there were increases in sales to other classes of customers. The increases were not sufficient to balance the decreases, but the net result was that the reduction was not nearly so great as had been anticipated. Also, as is mentioned elsewhere in this review, a significant proportion of the war load was carried on equipment which was beyond retirement age and was discarded as soon as the emergency had passed. Thus the electric utilities started in the postwar time with no more, perhaps a little less, than was required by the immediately foreseeable demands on them. It was possible, indeed, that the capacity shortage predicted for the prewar and war periods might occur in the postwar time. Strikes, shortages, general economic and political confusion, largely prevented the installation of new capacity in 1946, and in that year aggregate peak loads on electric systems were higher than during the war period.

Production Economy.—The greatest production of energy per unit of power capacity in the history of U.S. electric service was achieved in 1944—4,634 kw.hr. per kw., almost a 50% rise from 1937. But the steepest part of this rise occurred in the war years, although the rise was well started in 1941. The increase in unit production was largely the result of multiple shift operations in industry, keeping generation capacity at work for longer hours, but a significant contribution to the increase was made by loading machines more heavily and by narrowing the margin of capacity held in reserve for maintenance and for emergency.

How that margin was encroached upon appears from comparison of the 1937 and 1944 figures of peak loads and rated capacities. In the former year, the peak load was 25,350,000 kw. and the capacity was 37,134,000 kw.

The margin of reserve was then 11,784,000 kw., about 32%. In 1944, the peak load was 41,500,000 kw. and the total capacity 50,275,000 kw., a margin of 8,775,000 kw., or 17.4%. It should be remembered that these were national figures and that the margin ratios shown represented the average condition; in many particular cases machines carried what would have been considered in previous years to be dangerous overloads and were worked without shutdown for inspection and maintenance for periods excessively uncomfortable for their operators.

A significant betterment of thermal economy in electricity production was accomplished in the ten-year period. Pounds of coal per kw.hr. decreased from 1.42 in 1937 to 1.29 in 1944. But this improvement in thermal economy was more than cancelled out by the coincident increase in the cost of fuel. The average cost of fuel per ton rose from \$3.26 in 1937 to \$4.50 in 1945. The result was that the cost of fuel per unit of energy produced increased from 2.3 mills to 2.9 mills. Figures of 1946 fuel cost were considerably higher because of the national coal strike in that year.

Sales of Electricity.—Greatest amount of electrical energy sold any year of the decade, greatest also in the history of the industry, was in 1944, the peak year of war production. But, strangely enough, in that year of intense industrial activity, the 198,060,611,000 kw.hr. sold was divided between commercial and industrial customers on the one hand and all other users on the other in practically the same ratio as obtained in the division of about hall that amount, 99,358,791,000 kw.hr., sold in 1937. It is true that large industrial customers used a greater proportion of the total energy sold in 1944 than in 1937, but the increase—from 51 to 57%—was small in comparison with the difference in industrial activity between the 2 years.

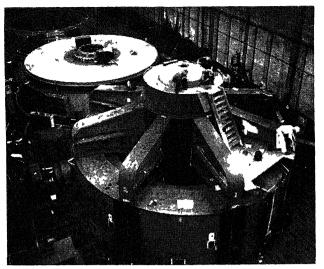

Explanation of the condition lay in the fact that despite restrictions, blackouts, brownouts, unavailability of new appliances and urgings to economize in every way, the U.S. people continued, in their homes particularly, to increase their use of electricity. As a matter of fact, the increase in energy sold to residential customers in 1944 was greater than in any preceding year since 1936.

This increase was not caused in major degree by a rise in number of residential customers. It resulted almost entirely from greater use of electricity in the home, as was shown by the figures of annual kw.hr. per customer. In 1937, the average residential customer used 805 kw.hr. By increases from year to year ranging from 34 to 55 kw.hr., residential energy usage had risen to 1,070 kw.hr. in 1943. Then in 1944 the increase was 81, to 1,151 kw.hr. in that year. Continuing to rise at about the same rate in 1945, the figure became 1,229; it rose further to 1,329 in 1946.

From 27,262,319 customers in 1937 to more than 35,000,000 in 1946 was the 10-year record of the electric utilities. More than 95% of the increase was in residential (including farm) customers. These customers increased in number during the war years. But the war period did more than merely slow up the increase in commercial and industrial customers; it reduced their number. In the two years of the war in Europe before 1942, business activity in the United States spurted forward with the result that utility customers in the commercial and industrial class reached a high of 4,472,653. When the United States entered the war, and priorities and other restrictions

A giant transformer nearing completion in 1941 was representative of the widely increased use of electric power and machinery in the United States during World War II

Grand Coulee dam waterwheel generator (108,000 kw.) shown in the foreground under construction at East Pittsburgh, Pa. In the background is a 40,000 kilowatt generator for Pickwick Landing dam in Tennessee

were imposed on business, there was a rapid mortality among this class of customers, their number falling to a low of 4,314,838 in 1943. As the end of the war approached, the number began again to increase more and more rapidly through 1945 and 1946, to reach an estimated 4,620,000 at the end of the latter year.

Revenue and Expenses.—As against \$2,160,797,500 in 1937, electric utility revenue was \$3,341,518,400 in 1945, an increase of about 55% in 9 years. Considering that the increase in sale of energy was nearly 100% in the same period, which was a time of generally rising costs, the ratio of revenue increase was modest. In only 1 year of the 10 was there a decrease in revenue; that was in 1938 and the decrease was only about 0.2%.

Although more electricity was sold in 1944 than in 1945, revenue was higher in the latter year. In 1944, the average revenue per kw.hr. was 1.65 cents; in 1945, 1.73 cents. The rise was explained by a reduction in 1945 of energy usage by industrial customers, who paid a lower rate. The loss in the one class of business was more than recovered by the gain in others. The period was one of numerous reductions in rates for all classes of customers. Combined with the reductions accomplished by increased usage of energy paid for on the lower steps of rates, their effects were seen in the continuously declining revenue per kw.hr. from residential customers. In 1937, this revenue was 4.3 cents; in 1945, 3.41 cents, a decrease of 0.89 cents or about 20%. For all classes of customers, the decrease in the 9 years was about the same in ratio, from 2.17 cents to 1.73 cents.

With the averages of the 5-year period 1935–39 as index bases, the cost of electricity to the residential customer showed a 1937–45 decline from 97.2 to 77.2, while the cost of living rose from 102.7 to 128.5.

In general, all except one of the expenses of U.S. business during the decade were more or less within the control of management, responsive in their different ways to improvements in equipment and in operating methods. The exception was taxes. This condition appeared clearly in the record of the U.S. electric utility industry, in the year-to-year figures of operating ratio, the share of revenue demanded by operating expenses.

From 38.5% in 1937, the electric utility operating ratio rose to 41.3% in 1945. The ratio was below the 1937

figure in 1938, 1939, 1940 and 1941, then it began to go up. Considering the rise of cost levels generally in the war years, the increase of 2.8% from 38.5 to 41.3 in operating ratio was not excessive and it reflected favourably on the competence of management.

But the picture was far different when taxes were included as an operating expense as, logically, they should be, because they were largely based on income. In 1937, the operating ratio including taxes of the electric utility industry was 53.8%. It rose 10.4% to 64.2 in 1945.

Labour.—On the index basis of 1939, employment in electric utilities was 103.8 in 1937, rising to 104.2 in 1941 and dropping to 84.2 in 1945. Corresponding indexes for man-hours worked were 105.6, 104.7 and 92.5, and for pay rolls, 100.2, 110.8 and 122.1. Reflecting the conditions of war was the rise in unit production per employee from an index of 91.1 in 1937 to 208 in 1944. Unit labour cost was highest in 1938, index 110.1, and lowest in 1943, index 65.9.

Comparison of the man-hour and pay roll indexes in 1937 and 1945 showed an increase in average pay rates of 30 to 40% in the 9 years. In Feb. 1946 the average utility worker took home \$50.63 per week as against \$40.60 for the average wage earner in the manufacturing industries.

Although it was not until after the war that strikes of electric utility employees became a matter of public concern, the history of the industry was by no means free of such phenomena. In the 9 years 1937–45, there were 63 strikes, 43 of them in the war years. But most of these strikes were of comparatively small groups of workers and did not cause widespread interruptions of service. A few did have or threatened such effect but they were settled fairly quickly. It was not until Duquesne Light company, Pittsburgh, Pa., employees went on strike in Sept. 1946, that any large metropolitan centre really felt the disruption of living and business resulting from the severely curtailed electric service caused by a large-scale strike. The walkout lasted 27 days; business loss to the community was estimated at \$300,000,000.

Construction.—More than \$5,000,000,000 was expended by the U.S. electric utilities for construction of plant and system facilities in the 10-year period 1937-46, exclusive of money spent on power by the federal government. Of this \$5,000,000,000,000, more than half was expended on the distribution system—the lines running along the streets and alleys of cities and towns and along country roads. Power houses took only about one-third of the total expended.

Construction slowed up greatly during the war years of 1943 and 1944 because materials were not available and capacity of electrical equipment manufacturers was largely turned to war production. In 1945, building was resumed with the end of the war, and for 1946 the electric utilities projected their largest construction budget since 1930. This program was not fulfilled, however, because of postwar strikes and shortages.

Financing.—Taking advantage of lowered rates of interest, practically every industry refunded long-term debts, none more diligently than the electric utilities. Of more than \$7,500,000,000 in utility financing in the years 1937–46, less than 8% represented new money coming into the business.

This was a remarkable situation. The industry in 10 years had doubled its output, increased its production capacity by about one-third, expended more than \$5,000,000,000 or construction and had assets of \$18,000,000,000 or more; but had taken in only about \$600,000,000 of new capital during the decade. Refunding debt at lower in-

terest made available much money for construction; depreciation reserves and accumulated surpluses added to funds available. But it was difficult to see how these resources could be sufficient for future expansion of the industry.

Farm Service.—The number of U.S. farms with electric service multiplied nearly three times during the decade, from 1,215,400 to an estimated 3,600,000. Of the total in 1946 about one-third were served by Rural Electrification administration (REA) co-operatives; the remainder, except for around 200,000 connected to lines of municipal and other public agency systems, were served by power companies. On the basis of these figures, around 60% of U.S. farms had electric service connection.

However, because of vague definition of what constitutes a farm, it was extremely difficult to adduce figures of farm electrification that would stand without question of one kind or another. Some farms had no dwellings on them, some had two or three or more; some rural dwellers were part-time farmers only and some people lived on farms and did not work them. Probably a fairer picture was obtained by considering rural dwellings rather than number of farms.

In communities of less than 2,500 population and including rural homes, farm and non-farm, there were, as of the end of 1945, 13,625,000 occupied dwellings. Of these, 9,400,000 had electric service, 8,050,000 from power company lines and 1,350,000 from co-operative systems. Within reach of electric lines, but not connected, were 1,600,000 dwellings, leaving 2,626,000 that did not desire service or could not get it. Thus it could be said that more than 80% of the rural population of the United States had electric service or could get it by signing an application.

Started by act of congress in 1935, the Rural Electrification administration had allocated some \$14,000,000 to 11 co-operative borrowers by June 30, 1936. Ten years later the accumulated total of loans to 856 borrowers was \$817,086,990; 474,837 mi. of line had been built, to which were connected 1,549,057 customers who paid \$80,275,086 for 2,185,149,697 kw.hr. in the fiscal year ending June 30.

Largest appropriation to the REA in any one year was \$300,000,000 in 1946, which brought the total of appropriations from the start of the administration to \$825,628,288. The funds allocated were expected to bring the totals of customers up to 2,088,127 and the mileage of line up to 674,742.

Expansion of REA systems was restricted during the war years by the channelling of materials and labour into the U.S. war effort. In the immediate postwar period, expansion was still heavily handicapped by shortages. REA co-operatives needed materials and equipment not only for the building of new lines, but also for the reinforcement and rebuilding of existing lines that had proved to be of too light design to carry the loads piled up on them. This condition was stated by Claude R. Wickard, REA administrator, in a speech to the Illinois Association of Electrical Co-operatives, Aug. 5, 1946: "Operating reports of REA borrowers reaching us in Washington indicate that 432 of 835 REA financed systems even now are not able to supply all the power needed by their present consumers."

Government Power.—Although generating capacity in U.S. government plants increased more than 6,000,000 kw. from 1937 to 1945, it was more than questionable that this increase was a manifestation of the will of the people. About three-quarters of it was in plants owned by the federal government and was not voted on by the

people themselves. The 1937–45 record showed that when the question was put to vote in municipal ownership and franchise elections, the people were much more against than in favour of government in the power business. Of 713 elections in the record, only 274 or 38.4% went against the power companies. Weighting the results of these 713 elections on the basis of populations concerned resulted in a ratio of less than 12% in favour of government ownership.

New Developments.-Most important development of the decade was the fluorescent lamp. First announced officially in April 1938, the new light source was foreseen primarily as a means of decoration. But it was not long before the tube was brought to practicality for vision, with an efficiency about double that of the incandescent lamp. The efficiency was accepted by the public as a means for "cutting the electric light bill," and many thousands of the new lamps were sold on that basis. The buying pressure thus created forced the lamp into the market before its characteristics were fully known and before its own development as well as the development of necessary auxiliary devices was completed. Thus the lamp was extensively misapplied, which might have caused a serious setback had it not been for the war when, like so many other things, the fluorescent lamp became unavailable to the general buyer.

During the war period much more was learned about the lamp, and it was greatly improved. When the war ended it was possible to market the lamp in much more orderly fashion and to apply it intelligently with proper realization of its shortcomings as well as its advantages. The principal thing learned about the fluorescent tube was that it could not be treated as a simple replacement of the familiar incandescent bulb, that as an entirely new and different kind of light source it required new and different techniques of application.

By 1946, when its dollar value in lamp manufacturers' shipments had reached about 17% of total production, the place of the fluorescent tube in the lighting art was pretty well established. Its most extensive application was still in commercial and industrial places, and its use in the home was still very small.

The decade saw an extremely large development in plastics of all kinds, caused principally by shortage of rubber during the war years 1939–45. As rubber substitutes, plastics became very important for electrical insulation on wires and cables. In some instances, as for building wire, the plastic substitutes showed important advantages over rubber in that a thinner layer of insulation could be applied to the conductor and the overall diameter of the wire thus reduced, allowing a larger number of wires to be put into a given space.

Outstanding among new plastics in electrical applications were the "silicones" which remain chemically and physically stable in low or high temperatures in which rubber or any other organic insulation in effect freezes or burns up. This characteristic of the silicones made possible the design of electrical equipment for much higher operating temperatures and consequently smaller for given energy-handling capacities.

Among electrical applications, several important advances were made, not of entirely new things like the fluorescent lamp, but accelerations of developments already in motion.

Of great importance in war production were three forms of electric heating—induction, infra-red and welding.

Any metal object brought into an alternating electromagnetic field has induced in it a secondary current whose effect is to heat it. As the frequency of alternation of the field increases, the secondary current tends to crowd nearer to the surface of the object and with it the resultant heat. Thus by using a field of proper frequency it became possible to heat the object to a desired depth from the surface. With fields of 10,000 cycles up to several hundred megacycles available from modern equipment and with proper quenching facilities, any desired characteristic of case hardening could be given to steel shafts, cams, gear teeth or other wearing surfaces. Also induction could be used for heating, for forming and forging, for brazing and for shrink fitting. A host of ingenious applications of induction heating were developed in the stress of war production, many of them much more economical of time, labour and money than previously used methods.

Infra-red heating utilizes the invisible radiant energy given off by any heated object. If the object is a filament enclosed in a glass envelope and heated by an electric current, it is an infra-red lamp. The only difference between it and an incandescent lamp is that the filament is not operated at as high a temperature, and it gives off less light. The radiant heat energy from an infra-red lamp can be directed by reflection just like light. This kind of heating became used extensively in industry for baking and curing enamel and other surface finishes and for drying.

The principal improvements of the decade in this method of heating were in reflecting surfaces, in design of lamps to handle greater heat concentrations and in arrangement of ovens and tunnels to conserve heat input.

Had it not been for advances in electric welding techniques, the flow of guns, tanks and ships from the "arsenal of democracy" would have been much slower and thinner. Most significant were developments in automatic welding, including methods of control which turned electricity on and off like water from a faucet, putting into each welding operation the precise amount of energy required for it, enough heat to make the weld but not enough to burn the metal. Particularly spectacular in both appearance and performance were automatic arc welders moving serenely along the butted edges of steel plates and joining them together in a bond stronger than the parent metal.

Not so significant in the war effort, but holding great possibilities in peacetime industry, was another electric heating development of the decade. This was dielectric heating, similar to induction heating in that it uses high frequency energy, but different in that it heats nonmetallic materials. Between two objects of different electric potentials there exists a condition of stress, called the electrostatic field. The stress in this field changes as the potentials of the two terminal objects change. Any nonconducting object between the two is subject to the changing stress, and its molecules strive to adjust themselves to it. If the changes are extremely rapid, heat is generated in the object by friction between the distracted molecules. Thus the object is heated from the inside out instead of from the outside in, as in induction heating. This phenomenon became extensively used in the preheating of materials for plastics before polymerization under pressure and heat into finished form. Also it was widely applied, and showed great promise of much wider use, in the processing of inorganic materials, as in food preparation.

A dream of the future was a house without a chimney.

The decade saw some progress towards that dream in the application of electricity to home heating. On the strict basis of cost, and using any known means of converting electricity into heat, electric heating for homes still could not be justified in competition with combustion. Nevertheless, there was a considerable amount of experimentation and trial of electric home heating, particularly in areas where government production of electricity had led to exceptionally low rates as in the regions supplied with energy by the Tennessee Valley authority and by the Bonneville Power administration. At the end of the decade, this experimentation had not yet proved that even by government subsidization of power could electric house heating be considered practical over the nation.

However, when electricity was considered not as the source of heat, but as a means by which heat could be brought into the home, the picture changed. It was possible to use electricity to pump heat into the house from outside, from the air, from the ground, from water. The heat pump, long known and long applied in mechanical refrigeration, became in the last years of the decade the object of serious consideration as a means for home heating. Several machines of this kind came on the market, and a program of co-ordinated development of the idea was laid before the utility industry.

Manufacturing.—In the 10-year period, production of the electrical machinery industry, based on 1925 production as 100, rose from a low of 97 in 1938 to 553 in 1944. These figures were to be compared with the federal reserve board indexes calculated on the same base of 77 for 1938 and 263 for 1943. Although during the war years many nonelectrical products were turned out by electrical manufacturers, and the index of their production was somewhat increased thereby, the comparative figures indicated the immense amount of electrical goods required for the war effort.

Revealing the effects of war on normal production of electrical goods were the indexes of shipments by categories made by manufacturers. Still on the 1925 base, refrigerators had risen to 1800 in 1941 and appliances, except refrigerators, to 212 in the same year. Then, in 1942, manufacturing in these categories was discontinued, and the indexes of their shipments dropped respectively to 16 and 25 in 1944.

Meanwhile, shipment of other electrical goods rose from

lows in 1938 to highs in the war years; electrical material, from 83 to 453 in 1944; industrial apparatus, from 97 to 638 in 1943; transmission and distribution equipment from 90 to 213 in 1942; insulated wire and cable, from 60 to 157 in 1941. These indexes revealed the adaptation of electrical manufacturing to war conditions. First came the discontinuance of production of consumer goods, next the accelerated production of apparatus and materials for the strengthening of the sinews of electricity supply, then the settling down to an outpouring of munitions of war.

War Record.—The electric utilities competently performed their task of supplying energy for the U.S. war effort while at the same time maintaining the accepted high quality of service to the civilian population.

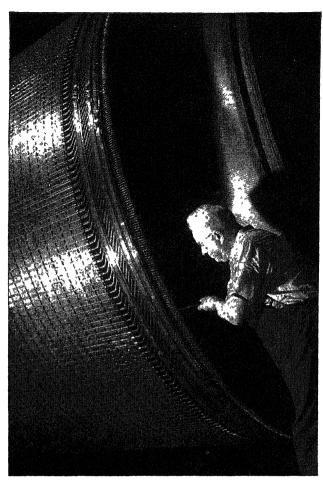

The Utilities Wartime Aid program, started early in 1942, was an informal organization of about 600 electric utilities, both privately and government owned. These utilities, serving the thousands of military establishments in the home country, made available to the army and navy their resources of experience, materials, equipment and skilled manpower. This relieved the military of the necessity of maintaining emergency crews and stocks of materials and equipment which would otherwise have been necessary to keep electrical systems in military establishments in continuous operation.

At no time during the war period was the use of electricity restricted or reduced because of lack of capacity to carry the load. In Sept. 1943, the government asked the utilities to bring to the attention of their customers the need for conserving manpower, fuel and materials for the war effort and to advise the elimination of display and advertising lighting of all kinds and otherwise to economize in the use of electricity. The utilities carried this message to their customers by advertising and personal contact, and soon streets, shop windows, signs and store interiors were partially or completely darkened. This voluntary restriction was made mandatory by government order in Feb. 1945, when fuel became even scarcer than before. This brownout of lighting actually saved only a very small amount of fuel; its primary purpose was to impress on the public the seriousness of the war situation.

In the first years of the war, steel for civilian uses was in short supply and wood was largely substituted for it in necessary transmission line and line terminal construction. This condition was reversed as the war entered its second phase; wood became short, and the utilities were forced again to revise construction practice. Many substitutions of materials were necessary. Retired equipment was restored to service; remarkable shifts and expedients were often employed to keep an outworn piece of apparatus or machine in service. Stocks of parts and materials were pooled so that one utility could obtain from another, often a long distance away, a needed coil of wire or an item of line hardware.

The net result of this co-operation was well expressed in the words of Rear Adm. W. R. Monroe, of the U.S. navy, "When we called for power, we got power and not—thank God!—alibis." (See also Public Utilities; Rural Electrification; Tennessee Valley Authority; Water Power.)

Great Britain and Europe

The production of electricity in Great Britain doubled every seven years from 1913 onward. In 1941 it was 16 times what it was in 1914, and its expansion was encouraged by the needs of World War II. New scientific discoveries led to new applications of electric power, new forms of apparatus and new materials. Particularly striking was the development of electronics, especially radar for navigational use. Two developments likely to have an important bearing on the future were the expansion of research activities and the increased attention paid to training of personnel.

Electrical Supply.—The changes in generation and transmission were mainly concerned with increasing the volume of power supply to meet demands and improving the thermal efficiency of generation and reliability of supply. It was estimated in 1946 that, apart from power for industrial purposes, 65% of the 12,000,000 homes in Great Britain had an electricity supply, and the total number of electricity consumers of all types was about 11,000,000. By

Jan. 1945, the total capacity of the generating plant for public supply was approximately 12,000,000 kw. Plans for the reorganization of electricity distribution in Great Britain were formulated just before World War II but were suspended in wartime and would be modified should the proposal of the Labour government to nationalize the industry be carried into effect. Under the national grid scheme, the supply frequency was standardized at 50 cycles per second and thus facilitated widespread interconnection of large areas of load. A further important step was the adoption of a national standard consumers' voltage of 240. In 1943, the North of Scotland Hydro-Electric board was set up for the purpose of developing a number of hydroelectric schemes throughout the highlands of Scotland. The national grid scheme, linking all large electrical power stations throughout the country, proved much less vulnerable to aerial attack than was predicted and was of major importance during World War II. Power was made readily available at dispersed sites for new wartime factories, and the effect on supply of bomb damage to plants was minimized by the availability of alternative supplies through the network interconnection afforded by the grid.

Electrical Manufacture.—Wartime demands for munitions of all kinds brought about a great increase in the use of power. This increased the demand for electrical power plants, transformers, circuit breakers, etc., as well as for power-absorbing equipment. Similarly, the demand for radio equipment of all kinds increased enormously and included the developments known as radar, first applied to the detection of aircraft and later to submarine detection, gun ranging, communication and navigation.

Apart from special war devices there were other noteworthy new developments. The use of hydrogen cooling in large turbo-alternator sets and synchronous condensers was essentially a United States development. The adoption of hydrogen cooling in Great Britain was a slower process, because of the lower speed of British alternators, but the keen desire to increase over-all efficiency of generating plants stimulated interest in hydrogen cooling. Air-blast circuit breakers, initially proposed in the United Kingdom as a result of work carried out by the Electrical Research association, were developed mainly on the continent during the early 1930s. In that period, British designs were mainly of the oil-blast type followed later by the low-oil-volume type of circuit breaker. Later a much greater interest in the air-blast design developed in Great Britain. The Central Electricity board did much to foster the manufacture of this type of switchgear, and both 66 kv. and 132 kv. gear incorporating air-blast breakers were put into operation on the grid.

Alternators suitable for direct generation at 33 kv. were introduced in Great Britain in 1936, and there was a gradually increasing demand for machines of this type. The desire for increased thermal efficiency of power plants brought about the use of increasingly higher steam temperatures and pressures. The Battersea power plant was extended to employ a steam temperature of 950°-960° F. The alternator was rated at 60,000 kw., 3,000 r.p.m. and hydrogen cooling was used. Developments in regard to high voltage cables were concerned with oil-filled and nitrogen-pressure types. Several installations of each of these were made on the grid for operation at 132 kv. During 1944 two further installations of nitrogen-pressure cable were commissioned, which made use of mass-impregnated paper dielectric in place of the preimpregnated

per dielectric used in the earlier installations. Several lengths of 132 kv. oil cable were in service on the grid in 1946, including the cables laid in the bed of the Orwell river to transmit the output of the new Cliff Quay power station at Ipswich.

New Trends and Applications.—Increasing interest in automatic control methods and equipment for the control of industrial processes led to the widening application of automatic combustion control for boiler plant, unified control of boiler auxiliaries, and automatic thermionic control of industrial heating, industrial handling and chemical processes. Thermionic control also assumed a most important role in electric welding processes and in flame cutting. Successful application of the principles of induction and dielectric heating on an industrial scale began before World War II in such operations as the heat treatment and melting of metals, the moulding of plastics, the cementing of leather, plywood and safety glass and the drying of tobacco.

Considerable interest developed both in Great Britain and other countries in the possibilities and advantages afforded by the heat pump for large space-heating purposes. The advantages of the heat pump were greater when cheap power was available, as in the case of countries having extensive hydroelectric development, a factor which encouraged its application in Switzerland. Installations were also made in the U.S. and in Great Britain, in the latter case being experimental in character.

Electric lighting, one of the first extensive commercial applications of electricity, underwent continuous development. An outcome of work done by the research laboratories of the members of the Electric Lamp Manufacturers Assn. was the fluorescent lamp, which became available in Great Britain in 1937. Large-scale production of this new type of light source was retarded by an endeavour to improve uniformity and interchangeability, and the outbreak of hostilities postponed production except for priority applications; nevertheless, these lamps played an inestimable part in the field of munitions production by providing high levels of illumination in factories in spite of blackout conditions.

Glass insulation, developed in the United States, the use of silicones and new magnetic materials were exploited in the industry. Organo-silicon compounds were developed for this purpose, and much work was carried out in the United States and Great Britain on such materials, which were produced in a variety of forms; e.g., resinous solids and liquids, liquid lubricants and greases, water repellents and rubber-like compounds, their common characteristic being stability over an unusually wide temperature range. The development of powder metallurgy resulted in new and improved magnetic alloys, such as aluminum-nickel-cobalt for special purposes.

Soviet Union.—Of large Russian electrical power plants, 59 were totally destroyed during World War II, involving an aggregate capacity of 3,000,000 kw., apart from smaller stations. New stations in the south helped to alleviate the power position. Much of the damaged Donbas power plant was reported to have been reconstructed, and 8 of the stations in the Leningrad district, which were completely destroyed, were restored to about 60% of prewar capacity. Thus, 58 power plants with a total output of 1,600,000 kw. were reconstructed in the soviet union between 1942 and 1946, and the prewar level was reached by the end of 1946. The final 3 years of the fourth five-year plan were to be devoted to the extension of electric power

220 plants to produce an additional 11,700,000 kw., so as to bring the total electrical capacity to 22,700,000 kw. as fixed by the plan. The estimated water-power resources of the soviet union were about 280,000,000 kw., and the plan was to increase the number of large hydro-stations to 49. New stations were contemplated in the Moscow district, in the Donbas district and at Rostov on Don. It was stated that the soviet government planned to make extensive use of high pressures and temperatures in steam plants, to extend the application of automatic control and to utilize, as far as possible, extra high-tension direct current for high-voltage transmission over long-distance lines. The construction at the Leningrad Metalicheski Zavod (Leningrad Metal Works) works of a high-pressure turbine was reported, the first of its kind and rated at 100,000 kw.; the working pressure of this machine was go atmospheres and its speed 3,000 r.p.m. Large hydroelectric turbines of 100,000-kw. capacity rating were also under construction.

Sweden.—Interesting experiments were carried out in the search for a solution to Sweden's power supply problem. Most of the water power worth harnessing continued to lie in the northern regions of the country, and in order to cover future increased power requirements new hydro plants would have to be built farther and farther away from the load centres in the central and southern regions. This would necessitate transmission of large blocks of power over long distances. Experimental work was in progress for the purpose of investigating the possibilities of extra high tension (E.H.T.) D.C. transmission. Large grid-controlled mercury arc rectifiers made the use of D.C. for high-voltage transmission systems possible. The Swedish Royal Board of Waterfalls and the Allmanna Svenska Elektriska Aktiebologet co-operated in the installation of 50 km. of experimental E.H.T. D.C. transmission line between Mellerud and Trollhattan, capable of transmitting 6,500 kw. at 90 kv. Another interesting experiment carried out in Sweden concerned the practicability of using the sea as a return conductor in an E.H.T. D.C. transmission circuit.

Switzerland.—Problems associated with the transmission of power over long-distance lines were investigated in Switzerland, particularly in regard to the use of voltages up to 400 kv., the design of suitable transformers of radial core type and air-blast, high-speed circuit breakers, the desirability of multiple breaking and automatic reclosing, as well as general questions relating to the stability of operation with g-phase power transmission over distances up to 1,000 km. The use of high voltage D.C. for power transmission was also developed. Interesting progress was made in the development and adaptation of the gas turbine for locomotives, marine drives and for electrical and industrial power generation. The first locomotive of this type was placed in service on the Swiss railways in 1941 and was rated at 2,200 h.p.; it was claimed that without substantial increase in weight or dimensions a locomotive of about twice this rating could be used. The gas turbine unit for electricity generation was constructed for ratings as high as 10,000 kw., an example being that built by the Swiss for the Filaret power station, Rumania.

France.—As in other countries where a large amount of power had to be transmitted over long distances, France had the problems of E.H.T. transmission under consideration and used a 220-kv. overhead network as well as a 220-kv. cable link; the latter was about 20 km. in length and ran between Clichy and St. Denis. In the overhead line between the massif central and Paris, the towers were constructed so as to be able to carry a single circuit at 400 kv. if future development so demanded, and meanwhile to carry 2 horizontally disposed circuits at 220 kv. A feature of the French network was the extensive use made of carrier current installations for intercommunication between substations and terminal units, for telemetering purposes and for protection equipment. Experimental interconnections of this type were also tried to measure the phase angle between distant points on the system, as a means of determining the degree of stability of the network. Circuit breakers of 3,500 mva. capacity were found necessary, in place of the 2,500-mva. units originally installed, in order to deal with the short-circuit currents arising under fault conditions, and all switches were designed for high-speed phase-by-phase disconnection. Rapid reconnection after fault conditions was also under experimental investigation. An interesting innovation in the French networks was the development in use of automatic load shedding. Under wartime conditions, much use had to be made of distant sources of supply at full capacity, and the tripping of such a line overloaded and tripped all other lines working at full capacity unless correction measures became operative within one second. To meet these conditions, frequency relays were developed capable of rapidly cutting out groups of consumers, thus shedding load immediately in appropriate areas in order to avoid complete tripping of the whole system. Considerable success was achieved by this means, and the method was regarded as offering advantages for wider future application.

Germany.—The air-blast type of switchgear was preferred in Germany to low-oil-volume types for voltages of 110 kv. to 220 kv., but performance was not satisfactory; this was because of the extreme economy of materials exercised by the designers. Experience with the watertype breaker was, however, satisfactory for voltages up to 30 kv., especially in those designs which utilized a series isolating switch separate from the interrupting element. Appreciable use of this type of breaker was apparently made. A transmission project which had reached the design stage during World War II comprised a 600,000-kva. line to operate at 400 kv. alternating current (A.C.) and intended for a 480-mi. stretch between the Alps and Cologne. As a result of corona loss tests carried out on a 500-m. experimental line, it was planned to use 4 steelcored aluminum conductors in parallel for each phase, using a 10-in. spacing between these conductors. Singlephase transformers were intended, and the system was to be protected by Petersen coils with movable iron cores; air blast switches rated at 400 kv., 1,000 amp. and 6,500 mva. rupturing capacity formed part of the design. Experiments were also carried out in Germany during World War II on E.H.T. D.C. transmission, in connection with the possibility of transmitting power from Norway to Germany. A short experimental line was built, transmitting 8,000 kw. at 60 kv., rectification and inversion being carried out by airblast type arc rectifiers. Further experiments were conducted using 110 kv. overhead lines for 10,000 kw., and based on this work a 400-kv. D.C. 160,-000-kw. system was planned for a 100-mi. line from a station on the Elbe to Berlin, but though advanced in construction, this installation had not been put into operation before the close of hostilities.

Electric Transportation

The usefulness of electric transportation was never more strikingly demonstrated than during the decade 1937–46, when it handled an increase of 35% in riding with almost no increase in equipment. Its greatest development was naturally in the larger cities, where it consistently handled nearly four-fifths of the total number of riders; but in many of the smaller cities, too, electric transportation remained predominant.

Electric motive power in the transportation of passengers and freight on the trunk-line railroads in the United States also demonstrated its value convincingly during the 1937–46 decade, when the volume of traffic reached an all-time peak. No clear-cut line of demarcation existed between the local and trunk-line fields of electric transportation. In some instances, local service was extended until it assumed a character closely akin to that of a trunk-line railroad. In other instances trunk-line railroads undertook electric service of a purely local character. Despite a certain amount of overlapping of functions, however, it is possible to consider electric transportation broadly under two heads: (1) local electric transit service and (2) electrified railroad service.

Local Electric Transit Service.—Urban electric transportation lines as a whole in the United States experienced an increase in the number of passengers carried, from about 10,000,000,000 in 1937 to more than 13,000,000,000 in 1946. The largest gross increase was in the traffic handled by the surface electric railway lines. A larger proportionate increase, though smaller in gross, was recorded by the electric trolley coach, or "trackless trolley" lines. On the rapid transit lines—elevated railways and subways—the volume of riding remained relatively constant.

Interpretation of the significance of this increase during the decade 1937–46 requires brief consideration of the prior developments in this field. Electric operation of street railways was the first widely adopted form of electric transportation. Starting at Mobile, Ala., in 1886, electric street railway transportation had spread rapidly in the following years to a large number of cities in the United States, and subsequently to other countries. It was instrumental in extending the populated areas of cities far beyond their former limits. It served also, in the form of interurban lines, to connect many communities separated by short distances. The early success of the electric railways, however, led eventually to excessive expansion. Many lines were built where there was insufficient traffic to sustain them.

Generally speaking, the number of passengers carried by the electric surface railways in the United States increased steadily until 1924. Then began a long period of steady decline, caused in considerable measure by the substitution of motorbuses on light traffic lines.

The beginning of the decade 1937-46 found the downward trend proceeding at a fairly rapid rate. By 1940, the annual total of passengers had dropped from a peak of 13,500,000,000 in 1923 to a little less than 6,000,000,000. In 1941, however, the downward trend was arrested. Before the end of that year the growth of industrial activity in connection with the national defense program had stimulated the use of public transportation services to a point where every available vehicle was needed. The Office of Defense Transportation, having authority over all forms of rail, highway and inland-waterway transportation in the United States, ruled early in 1942 that no further replacements of railway service by bus service should be made for the duration of the emergency. This ruling halted abandonments, and the growing difficulties of obtaining gasoline and tires for the operation of automotive vehicles caused the riding on electric railways to increase rapidly. By 1945, the number of passengers carried was approximately 9,500,000,000 or about 60% more than it had been a few years earlier. With the end of the war the volume of street-railway riding decreased slightly, as did riding on all forms of public transportation. The change was relatively small, however, and preliminary figures for 1946 indicated a total of more than 9,000,000,000 passengers carried during that year.

Another form of electric transit service—that of the electric trolley coach—registered a much larger proportionate increase than did the surface railways. The electric trolley coach, first called a "trackless trolley" because it somewhat resembled a streetcar running on rubber tires instead of steel rails, was originally introduced on a commercial basis in 1910, but had almost disappeared from U.S. cities by 1928, when it was revived as a result of improvements in design.

In 1937, trolley coaches in the United States carried only one-third of 1,000,000,000 passengers, while in 1946 they carried more than 1,250,000,000. This was a gain of more than 300%, the largest for any type of transportation service.

Since the increase in trolley-coach riding was exceptional, it was evident that factors other than the general increased use of public transportation were at work. Chief of these was growing public enthusiasm for this particular type of vehicle because of its quiet, speedy operation, the convenience of curb loading, and the comfort of the coach itself. Opinion polls taken among users of public transportation service in cities in all sections of the United States showed the trolley coach to be the best liked of all forms of public transportation. In some instances the proportion of people expressing preference for the trolley coach ran more than 90% of the total.

The majority of the trolley coach lines in the United States continued to be operated as substitutes for street railway lines, although there was a growing tendency for trolley coaches to replace motorbuses. To some extent the passengers carried by the trolley coaches represented business that would otherwise have been handled by streetcars or motorbuses, but, in most instances, the trolley coach service carried far more passengers than the service which it replaced.

The third important type of urban electric transportation service is that furnished by the rapid transit lines elevated railways and subways. Development of this type of service was slow on account of the extremely high cost of the facilities. Moreover, the removal of a number of the early elevated railway lines during the decade offset

Chicago's first subway, 41/2 mi. long, was opened Oct. 17, 1943

to some extent the construction of new subways.

Like other types of transit, the rapid transit lines registered an increase in business during the decade 1937–46. The gain, however, was relatively small. Passengers carried in 1937 totalled about 2,250,000,000. In 1946 the number was about 2,500,000,000. This comparative stability in volume of riding is explained by the fact that the rapid transit lines were generally located in areas which experienced only minor increases in industrial activity during the war.

Plant and Equipment.—To handle the largely increased volume of riding during the war years, the electric surface railways made far more intensive use of their plant and equipment than at any previous time in their history. Before the war these lines were carrying about 300,000 passengers per mi. of track per year. At the peak of the war effort they were carrying 575,000 passengers per mi. of track.

Trackage of the surface railways totalled about 24,000 mi. at the beginning of the 1937–46 decade as compared with more than 40,000 mi. in 1923 before large-scale substitution of buses and trolley coaches. By the end of 1941, the trackage had shrunk to approximately 17,000 mi. Thereafter, under the regulation of the Office of Defense Transportation, there were no further abandonments of any consequence.

In place of the electric railway track abandoned during the years 1937-46, about 1,600 mi. of new trolley coach line were put in operation. This was done for the most part on routes where riding was fairly heavy, but the track was in need of replacement. Substitution of trolley coaches saved expense and almost invariably increased the volume of riding.

On a large majority of the other routes where electric railway operation was given up, motorbus operation was started by the same or other companies. In many instances this proved advantageous from a financial standpoint, as the motorbuses were able to handle the comparatively light traffic at low cost. In the relatively fewer instances where substitutions were made on heavy traffic lines the financial advantages were less clearly evident. A minor part of the abandoned rail routes, where the riding had been of least density, remained without public transportation service of any kind.

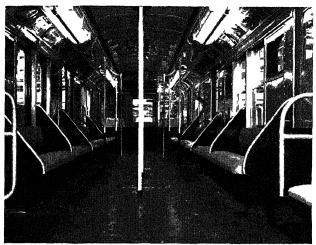

Throughout this period the total mileage of rapidtransit track remained virtually unchanged. High cost of construction, as well as restrictions imposed by the war, limited subway extension to not more than a few miles. Such extensions as were made were counterbalanced by abandonments of elevated railway lines.

Trends with respect to rolling stock from 1937 through 1946 generally paralleled those with respect to trackage. In the 1920s the electric surface railways had a total of more than 60,000 cars, including open cars for summer use, and unserviceable vehicles waiting to be scrapped. The total available for operation at one time was probably not greatly in excess of 50,000. By 1937 this had been reduced to 37,000 and by the outbreak of World War II to about 27,000. From then until the end of 1946 the number did not change greatly. Thus, the railways had 10,000 fewer cars with which to handle a 35% increase in traffic during the war years. They were able to do it first, because staggered business hours distributed the volume of riding more evenly throughout the day, and second, because improvements in rolling stock design permitted each vehicle to handle more passengers per day than had formerly been possible.

In the field of trolley-coach operation, the number of vehicles in the ten-year period increased at a rate which was somewhat more rapid than the increase in mileage of line, but not so rapid as the increase in passengers—a natural result of growing popularity of this type of service. The number of rapid transit cars remained virtually unchanged throughout the decade.

No widespread changes occurred in the ownership of plant and equipment during 1937-46. Several important transit systems were acquired by the municipalities in which they operated, but these changes were not indicative of any general trend. The New York city board of transportation took over the Interborough Rapid Transit company and the Brooklyn-Manhattan Transit system in 1940. The city of Cleveland acquired the Cleveland railway in 1942. In San Francisco, the Municipal railway absorbed the Market Street railway in 1944.

Vehicle Design.—From the standpoint of vehicle design, the decade 1937–46 was probably the most important in the history of surface electric railways, because it witnessed the practical culmination of years of experimental research. Development of automotive vehicles running on rubber tires had earlier convinced the leading electric-railway operators in the United States that drastic changes were necessary in traditional streetcar design to provide comfort and speed equivalent to that of the private automobile. For this purpose the Electric Railway Presidents' Conference committee had been formed, and \$1,000,000 had been spent on research. The outgrowth of this undertaking was a radically different type of streetcar with scientifically engineered rubber springs to reduce noise and

New subway cars featuring fluorescent lighting and fast-action doors were designed to replace many outmoded cars operating through New York's network of underground traffic in 1946

promote riding comfort, together with new types of motors and controls for smooth, rapid operation.

About 200 vehicles of this type, called P.C.C. cars in recognition of the work of the Presidents' Conference committee, were in service in U.S. cities at the beginning of 1937. Their superiority over previous designs was so marked that widespread demand for them arose almost immediately. By the end of 1946 more than 3,000 P.C.C. cars were in service on a score of electric railway systems in the United States and Canada. The largest installations were at Pittsburgh, Pa., and Washington, D.C., with 566 and 489 cars respectively. Philadelphia, Boston, Baltimore and St. Louis were among other cities with large installations.

Improvements in the design of the P.C.C. car continued throughout the decade. One was the replacement of the conventional compressed air brakes by complete electric braking. With all other devices such as door engines, windshield wipers and the like operated electrically, the need for compressed air on the car was entirely eliminated. Further evolution took place in truck design for simplicity, lightness and greater flexibility in springing. "Standee" windows were introduced for the convenience of standing passengers. Ventilation was improved by means of air ducts through a monitor roof and large fans capable of changing the air in the car several times per minute. Under this arrangement the car was much more comfortable in hot weather.

Many of the improvements developed in connection with the P.C.C. car found application in the design of articulated units for rapid transit service in Brooklyn and Chicago. These units, however, were experimental in nature, and rapid transit rolling stock in general remained of conventional design. In the latter part of 1946 the New York city board of transportation ordered 400 new subway cars embodying a number of features of P.C.C. design.

An outstanding design development in the trolley coach field was the successful adoption of air conditioning on a vehicle for city service. The attractive features of air conditioning for transit vehicles had long been recognized, but the rapid interchange of inside and outside air resulting from frequent door opening made it difficult to provide a sufficient volume of cooled air to maintain a comfortable inside temperature in hot weather. However, the electric trolley coach had an unlimited supply of power available to operate the air-cooling apparatus, and it was

decided to make the experiment. The first vehicle of this type was put in service in Atlanta, Ga., in the summer of 1945. It was received by the public with such marked enthusiasm that 30 more of the same type were ordered almost immediately. All indications pointed to the Atlanta innovation as the first step in widespread adoption of air conditioning for electric transportation vehicles.

Postwar Outlook.—As a result of the remarkable record made by electric transit service during World War II, as well as the notable advances made in vehicle design, the outlook for this type of transportation appeared brighter at the end of the decade than at any time for years past. Postwar city transportation plans under discussion in cities all over the United States gave a prominent place to electric transportation.

Many improvements were planned for the rapid transit lines in the city of New York. Subway extensions were in prospect at Chicago. A combination of rapid transit and suburban railroad lines was under consideration at Boston. New subway projects were being discussed for Detroit, Cleveland and San Francisco.

Modernization of electric surface railway lines was under way in many cities, including Chicago, Philadelphia, Detroit, St. Louis, Minneapolis, Cleveland, Kansas City, Birmingham and others. During the first year after the removal of wartime restrictions, orders were placed for approximately 1,300 of the popular P.C.C. cars. On this basis, transit authorities anticipated that about 5,000 to 6,000 of the new cars would be placed in service within a few years, giving the surface electric railways as a whole a total of about 10,000 modern vehicles. Replacement of the remaining surface rail cars was expected to be made largely with electric trolley coaches, or with motorbuses on some of the lighter traffic lines.

Great expansion of electric trolley coach operation appeared likely in many cities throughout the United States. Among the larger programs announced were those involving 435 vehicles for Brooklyn, 250 for Cleveland, 250 for Atlanta and numbers only slightly smaller for Los Angeles, Boston, Philadelphia, Memphis, Milwaukee, Kansas City, Cincinnati, Denver, Providence, San Francisco and other important cities. While most of these plans involved the substitution of trolley coaches for streetcars, it was significant that numerous cities had already made, or were planning to make, substitutions of electric trolley coaches for motorbuses on some routes. At Newark, N.J., it was proposed to pave the track area of the city subway and use it for electric trolley coaches instead of streetcars.

Advantages attributed to the electric trolley coach included low operating and maintenance cost, a superior safety record and popularity with the public. Moreover, it was generally considered to be quieter than the motorbus, and the absence of fumes was widely cited as a highly desirable characteristic.

In Central and South America, where electric transportation had reached only a moderate state of development before World War II there seemed little prospect of notable advance. In Australia, on the other hand, interest was shown in new vehicle designs and improvement of electric transportation in general.

Electrified Railroads.—More intensive use was made of the electrified trunk-line railroads in the United States during the 1937–46 decade than at any previous time. Since most of the electrified trackage was still operated in conjunction with steam trackage, separate statistics were not available for passengers and freight carried. What

happened on the four-track, 226-mile electrified New York-Washington line of the Pennsylvania railroad, however, could be taken as characteristic in some degree of all the electrified railroads.

The decision to electrify this line for its entire distance had been made during the period of widespread railroad improvement that followed World War I. Electrification was completed in 1935 and resulted in a reduction of several millions of dollars a year in operating expenses.

The greater track capacity made possible by the use of electric power on this line was of inestimable value in World War II. During this period the New York-Washington line was the busiest stretch of railroad track in the world. For the four years, 1942 through 1945, it carried nearly 200,000,000 passengers, often more than 200,000 in a single day. The freight transported during these four war years was approximately 160,000,000 tons. Wartime traffic was exceptionally heavy also on most of the other electrified trackage of the Pennsylvania system and other railroads. Under these circumstances the use of electric power proved highly advantageous.

The heavy wartime traffic carried by the electrified lines was handled with virtually no increase in plant and equipment. At the beginning of the 1937-46 decade there was a total of 6,135 mi. of electrified track in operation on the Class I railroads in the United States. By the end of the ten-year period this had increased to about 6,650 mi. The number of electric locomotives increased from 743 to 745.

Of interest in the field of vehicle design was a postwar trend toward larger electric locomotives on some railroads. Two 5,000-h.p. units were ordered by the Great Northern for its electrified Cascade Tunnel section. With an overall length of 100 ft. and weighing 720,000 lb. each, they were the largest single-cab locomotives ever built. An even heavier type, weighing 1,000,000 lb., but built as a two-cab unit, was developed for the Virginian railway to haul coal trains over the Allegheny mountains. Four of these were ordered. They were the heaviest and most powerful locomotives of any kind ever built.

While the number of electric locomotives remained constant, it was significant that the number of Diesel-electric locomotives increased from 175 to 3,009. Undoubtedly the rapidly growing use of Diesel-electric motive power had a material effect on the electrification of trunk-line railroads. A possible development of the future was a gas-turbine locomotive with electric drive.

Two major electrification projects had long been under discussion. One involved the extension of electric operation on the Pennsylvania from Harrisburg to Pittsburgh. The other involved electrification of the main line of the New York Central from Harmon, N.Y., to Buffalo, N.Y. Extensive tests of Diesel-electric operation were made on both these lines.

From the operating standpoint, the Diesel-electric locomotive had an important advantage in being a self-contained unit capable of operating wherever there were tracks, while the electric locomotive was restricted to trackage where electric power was available. Moreover, the first cost of providing power supply equipment was high. This factor of first cost tended to limit electrification to lines with unusually dense traffic or where special conditions existed to make electrification economically sound.

BIBLIOGRAPHY.—American Academy of Political and Social Science, Transportation: War and Postwar (1943); American Transit Association, Proceedings (1937—); Federal Power Commission, National Power Survey: Uses of Electric Power in

Great Britain and Europe.—World War II very largely stopped the development of electric transportation in Europe, and existing installations suffered varying degrees of destruction. In some neutral countries, however, particularly Sweden and Switzerland with their well-developed hydroelectric resources, there was a continued or even accelerated growth of the electrified mileage because of the acute fuel shortage. This shortage further forced attention upon electrification in postwar reconstruction plans; France announced a further extensive undertaking.

The choice of system was still a matter of consideration. Early in 1946, the French railways examined the whole question afresh and confirmed the extension of the existing 1,500 volts system for their new work. Two main systems were used in Europe. With some exceptions, single phase A.C. at 16% cycles, 15,000 volts was the rule for central Europe and Scandinavia, and 1,500 or 3,000 volts D.C. was used in Great Britain and the Latin countries of Europe. No new system was put into operation after the electrification in 1936 of the Hollental line, an experiment carried out by the German state railways. Established control systems for locomotives and multiple unit stock remained with the general use of electropneumatic rather than magnetic contactors. On A.C. systems, the growing power of the largest locomotives tended to make the usual low-tension tapping switch impracticably heavy, and an arrangement was developed with a fixed ratio step-down transformer and a separate high-tension autotransformer with a tapping switch. On D.C. lines, two alternative control systems were developed. The Metadyne, which originated in Italy, was tried to a limited extent on locomotives in France. This converter comprised a single armature cross-magnetization machine which handled all the power supplied to the motors. At starting it gave a steady current at variable voltage, thus eliminating all irregularities of tractive effort, and it was used at stopping to permit regenerative braking down to a standstill, with a consequent saving of energy and reduction in brake-block wear. It was fitted to more than 200 vehicles in a very intensive urban service in London, but its extension in more general service was precluded on economic grounds. The second new system was designed primarily to produce a locomotive which would maintain its tractive effort when passing over gaps in a third rail system. By this system, energy was transmitted to the motors through two reversible booster sets.

These sets incorporated large flywheels which stored sufficient energy to maintain the tractive effort across a long gap.

Single-phase motors improved in design. Fabrication and design in Swiss A.C. motors reduced the weight per h.p. from 18.7 lb. to 9 lb. in motors of comparable size. a remarkable reduction compared with the weight per h.p. of D.C. motors, the best of which were 19 lb. per h.p. Under the pressure of demands for trains of greater speed and capacity, considerable progress was made in the reduction in the tare weight of rolling stock by the use of light metals and improvements in design. In England, new lightweight all-steel stock for suburban work showed a reduction in weight of 21%, as compared with standard stock of the same seating capacity. Great advance was made in welding technique, although experience in the fabrication of high-tensile steels was not entirely satisfactory. Most continental European countries had, up to the outbreak of World War II, developed lightweight electric rail car services which operated at high speeds, and

many of these were being restored in 1946. Remarkable speeds were attained in Italy on the direct Appenine line between Florence and Milan, where a top speed of 126 m.p.h. was reached with a pass to pass average of 109.2 m.p.h. over a 124-mi. stretch. These three-car articulated streamline sets took 94 passengers, with kitchen and baggage accommodation, and weighed 115.5 tons. The weight reduction of locomotives could not be carried beyond the point where adhesion was affected, but the Swiss railways developed units of high power-weight ratio. In that country terrain difficulties, gradients and sharp curves imposed restrictions on very high speed running, but locomotives of high power-weight ratio, able to maintain a good speed on gradients, enabled fast schedules to be introduced. The Swiss Federal system had for some time possessed the most powerful locomotives in Europe. In 1982, it had an articulated 14-axle 270-ton locomotive rated at 8,000 h.p. continuously.

In 1939, a similar unit which was some five tons heavier, rated at nominally 12,000 h.p., was introduced. Later units were built as two separate portions capable of independent use.

The outstanding development in locomotive mechanical design was the disappearance of the side-rod drive on new designs, except for shunting units. On the Swedish state railways, where local conditions seemed to favour the side-rod drive, locomotives with individual quill drive were introduced in 1942. In Switzerland, the early arrangement of jack shafts and connecting-rod drives was replaced by various forms of individual drives. In 1946, the Lotschberg railway introduced a four-axle, double-bogie locomotive of 4,000 h.p. weighing only 88 tons, remarkable both on account of the high power for a locomotive of its wheel arrangement and on account of its use of the Brown Boveri spring-disc flexible drive.

The axle-hung motor was used on the great majority of low- and medium-speed locomotives and on multiple-unit stock, but flexible drives of many different types were universal on express locomotives and on some few high-speed rail-car sets.

The effect of World War II on the development of Diesel-electric traction was very severe, as the natural line of development for those countries not at war was towards electrification. In Great Britain, the London, Midland and Scottish Railway company demonstrated the superiority of the Diesel-electric locomotive as a shunting unit. On the continent, before the war, the stage of progress as in the U.S. was that of the multicar streamline train, with a considerable number of single-rail car services. In Germany, where the original Flying Hamburger was introduced in 1933, 14 3-car sets of 1,000 h.p. each were built

in 1938. The Netherlands railways, which had introduced Diesel-electric traction at about the same time, had 18 5-car sets on order at the beginning of the war and intended to operate every nonelectrified express train in Holland by Diesel power, with the exception of international trains. In France, postwar plans were drawn up to re-establish developed railcar services, and two main-line Diesel-electric locomotives, which were delivered to the national railways in 1938 and kept out of service throughout the war, were put into service. These locomotives of 4,000 h.p. were originally intended for the Paris-Mentone run of 620 mi. in ten hours.

The most significant development was the gas-turbine electric locomotive built by Brown Boveri in 1939, in use on the French railways in 1946. This unit had an output of about 2,000 h.p. and weighed 92 tons. It used a cheaper grade of oil than the Diesel locomotive but had a lower thermal efficiency.

Electronics

The art of using electron tubes for harnessing electrons to the service and destruction of man progressed so rapidly in the decade 1937–46 that historians might well designate this period as the birth of the electronic era. Admittedly many of the new and successful applications of electronics came into existence only because of complete abandonment of economic considerations under extreme pressure of military necessity.

Already, however, the natural and evolutionary simplification of complex and uneconomical electronic apparatus was well under way.

As one example, an electronic calculator urgently needed during World War II for preparing ordnance firing tables was successfully completed with 18,000 tubes and a structure filling an entire room, at an expense so high that in normal times the project could not have been started by even the largest industrial concerns or research laboratories.

With initial research costs and experimentation paid for, however, it became entirely feasible to build simpler yet equally efficient machines.

Electronics assumed two roles-improving existing equip-

Route Mileage and Systems in Operation on Electrified Lines in European Countries*

^{*}This table does not take into account wartime suspensions and postwar restorations of services.

ment and techniques and making possible entirely new devices. Industrial applications fell chiefly into the first category, while military electronic devices were preponderantly new. Both roles combined to speed final Allied victory in World War II, bringing forth an output of new scientific developments unparalleled in the history of man and simultaneously converting these to practical reality and mass production.

In industrial electronics the three leaders during the decade were electronic control of resistance welding, radio-frequency heating and rectification of power with mercury-arc tubes. The first two achieved prominence after 1936, while the last was one of the oldest industrial applications of electronics and possibly also the most extensive on a world-wide basis. Voltage regulation, motor control, remote position control, photoelectric applications and a host of other items furnished still more fascinating electronic achievement stories for the eventful decade, even though the nature of their use precluded mass adoption by all industries.

Welding Control.—Resistance welding is done with the heat generated when two pieces of metal, squeezed together, resist the passage of an electric current through their junction. Electronic equipment was perfected automatically, controlling the amount of welding current and the time of flow to assure absolute uniformity of each weld even on machines making hundreds of welds per minute.

Resistance welding was the only method of metal fabrication at the end of the decade which added no weight to the material. Foil as thin as 70 millionths of an inch could be spot-welded to leads, and two pieces of heavy steel one-half inch or more in thickness could be welded together. In fabricating modern lightweight alloys used in aircraft manufacture, split-second timing and exacting control of current and electrode pressure were vital to high-quality welds of uniform strength. Electronic welding control could send accurately controlled current stabbing through the metal as many as 1,800 times a second—"sewing" plane parts together faster and stronger than ever before.

Spot welding, projection welding, seam welding and butt welding are different types of resistance welding. With electronic control all four types became invaluable in speeding production, reducing costs and performing jobs that would be impossible without electronics.

Electronic Heating.—This covers the application of high-frequency current to two broad fields—the induction heating of conducting materials such as ferrous and nonferrous metals and the dielectric heating of nonconductors such as plywood, plastics, textiles, rubber and foods. Both fields used exactly the same electronic equipment during the decade, and differed only in the respect that energy was transferred to the material by coils in induction heating and by metal-plate electrodes in dielectric heating.

In induction heating the part to be treated is placed in or adjacent to a water-cooled coil carrying a high-frequency alternating current. The magnetic field thus produced induces a current in the surface of the part or to any desired depths and causes the part to heat largely by resistance losses.

Electronic induction heating had many advantages over older methods, including speed, the ability to heat only localized parts of a metallic object, accurate control of temperature and heating time and heating of metals covered by coatings or enclosed in glass.

Production soldering of parts or assemblies while travelling on a continuously moving conveyor belt is an elec-

tronic power application in which the areas to be united are selectively heated by induction. In the manufacture of oil-filled capacitors the metal containers have their lids soldered in place to provide a sealed oil-tight unit. By using a conveyor belt to pass these capacitor cans between two coils in which current from a radio-frequency generator is flowing, this soldering is automatically accomplished at a very rapid rate.

As another example of induction heating, a certain piece of equipment required a setscrew that had its slotted end hardened to permit repeated removal with a screwdriver without damage. The other end had to be left unhardened so that it would seal properly to effect a gas-tight seal. A small turntable was used to swing the setscrew through a hairpin-shaped coil carrying radio-frequency currents. These caused the slotted end of the setscrew to be heated sufficiently for hardening. The setscrews then automatically dropped into a water quenching bath. The hardening was confined to a depth of about one-tenth of an inch at the slotted end, with the remainder of the setscrew unchanged.

The oven-baking of paint on metal radio tubes had been a space and time consuming process. If, however, the tubes were passed through a long coil carrying radio-frequency current, heat was induced in the metal shells and baking of the paint could be accomplished in as little as 15 seconds.

Shaking a beanbag up and down a million times per second to heat the beans by friction is a very rough analogy to electronic dielectric heating. The nonconducting mass to be heated is placed between the flat metal electrodes. When the upper electrode is positive, every electron in every atom throughout the entire mass strains upward, since opposite charges attract. When the current reverses, the lower electrode becomes positively charged and the electrons all strain downward. This occurs at the frequency of the generator, millions of times a second, so heat is developed rapidly. The method works for almost any substance that is not an electrical conductor and for such varied processes as bonding, drying, sterilizing, cooking, baking and curing.

The application of electronic power made it possible to speed up many wood-bonding processes. The ability of radio-frequency power to heat uniformly and quickly large pieces and thick sections for laminating and pressure bonding became extremely important in fields such as aircraft manufacture. Power furnished by a radio-frequency generator reduced the time cycle in the manufacture of compressed and impregnated wood propellers from nine hours to three hours. Also, a much more uniform cross-sectional structure resulted from preheating the stacked-up raw material by this method.

The same principles were applied to the construction of spars, ribs and fuselage sections where it was desirable to utilize high-temperature-setting synthetic resin glues, much more durable than previous types.

In the field of plastic moulding, the preheating of preforms (roughly formed blocks of moulding compound) by ovens or hot plates was not very satisfactory because the poor heat conductivity of the moulding compound tended to cause the outside of the preform to overheat before the inside was hot enough. Radio-frequency power heated these preforms quickly and uniformly to a high degree of plasticity, thus enabling the moulding press to operate at a much faster rate.

Thermoplastic sheets and thermoplastic-coated fabrics used in making raincoats and caps, large balloons and in the packaging of many types of food and oils were fused

or sewed together with electronic heating to give a thin solid seam both air- and water-tight, creating a bond as strong as the thermoplastic itself. The sheets to be fused together were simply run between two metal wheels that served as the electrodes for a dielectric heating setup.

Power Conversion.—In mills and mines, factories and railroads, wherever direct-current power is needed, mercury-vapour electronic tubes were installed to convert A.C. to D.C. efficiently. By 1946, three-fourths of all the direct current required for the giant aluminum and magnesium plants of the world was being supplied by these tubes, working quietly 24 hours a day. In smaller sizes these rectifying tubes had glass housings like familiar radio tubes, but the larger ones were made almost entirely of metal and looked like row on row of tanks or boilers connected by massive current-carrying copper straps. As contrasted with rotating generators, these electronic rectifiers had no moving parts and operated automatically, unattended, with high efficiency.

Sorting.—Right on the production line, accurate and tireless electronic tubes became widely used to sort coloured objects electronically and reject those that are off-colour. Other tubes sorted for height, thickness, weight or any other measurable factor. Thus, discoloured beans were ejected automatically from electronic bean sorters using photoelectric tubes; pills and tablets were sorted according to whether they were overweight, underweight or perfect; projectile fuses exposed to X-rays, with phototubes watching fluorescent screens on the other side got sorted according to whether or not they had the correct powder charge; metal objects passing through coils at faster-than-sight speeds were sorted for hardness, composition, size or other factors affecting their magnetic characteristics.

One electronic metal-sorting device brought order out of the chaos of spilled or jumbled alloy stocks and parts in machine shops by employing the triboelectric principle the same one that makes sparks when a cat's fur is rubbed backward. In this instrument an electronic circuit controlled the total operating time during which known and unknown metals were rubbed together by an electric motor, and a meter indicated the resulting voltage developed between the two pieces. Reference to a table then gave the identity of the unknown metal.

Speed Control.—The precision of electronic equipment made possible fingertip control of speed of giant electric motors, the almost instantaneous stopping of great mills when a paper or thread broke, and the regulation of speed to precise values despite extreme variations in loading of a machine. Other arrangements of controls made speed vary with such factors as torque, so that pressure on a cutting tool would remain constant during machining of irregular objects.

Protection.—Phototubes were adopted to protect operators of punch presses, metal shears and other hazardous machines by shutting off power and applying brakes when any part of the operator's body projected into a beam or fence of light surrounding the danger area. Similarly, interruption of a light beam surrounding high-tension testing equipment or high-power sub-stations would sound an alarm and cut off the power supply to the danger area.

Medical Uses.—Diathermy and X-ray applications multiplied as equipment was made simpler and more reliable in operation. Many X-ray machines were built with automatic photoelectric exposure controls to shut off the machine when the film had received sufficient exposure through the body of the particular person being examined. The radio knife, using high-frequency radio currents to destroy tissues or coagulate blood in a very small area near

the point of a needle, was used more and more for delicate operations. Sensitive electronic metal locators were employed to locate metal objects imbedded in the body. A photoelectric device developed during World War II monitored continuously the oxygen saturation in an aviator's blood by sending a beam of light through the ear to a photoelectric cell, to warn the pilot when he needed more oxygen. Electronic instrumentation for diagnosis of mental and other ailments underwent further development, along with improvements in electronic lie detectors.

Nuclear Physics.—Many huge electronic machines for whirling electrons and other particles around and around a circular orbit in a vacuum were constructed in the tenyear period, for such purposes as production of radioactive isotopes, transmutation of elements (though in microscopic quantities and at great cost), smashing of atoms and a multitude of other researches in nuclear physics that resulted in such significant developments as the atomic bomb (q.v.). One of these machines was a super X-ray generator or betatron that among other feats could actually create matter from energy. The 100,000,000-electron-volt X-rays it produced were capable of making sharp, high-speed radiographs through 12 inches of steel.

Military Electronics-Electronics became the nerve centre of the battleship, the means of locating enemy planes, ships, submarines and land installations, the means of communication between command posts and mobile units, and the co-ordinator of great air and naval fleets. It detected buried land mines, whether of metal or plastics, plotted on a map the route taken by a patrol car in darkness over unfamiliar territory, detonated underwater mines at the precise moment when a surface vessel was closest, told pilots how high they were and where they were, told the navigator on a ship how deep was the water under the hull and even enabled sight at night by converting invisible infra-red radiation into glowing visible colour on a screen. New names by the score evolved in this periodsonar for sound navigation and ranging under water, used principally for submarine detection but good for locating fish in peacetime; loran for long-range navigation of ships and aircraft by measuring time intervals between synchronized radio pulses sent out by pairs of shore radio stations; shoran for precision short-range functions of loran; radar for radio detection and range determination of objects up to 100 miles away; huff-duff for determining instantly the direction from which a radio message was coming, used during the war to locate enemy submarines that went on the air for only seconds at a time. (See RADAR; RADIO.)

Elizabeth, Princess

Princess Elizabeth (1926-), heiress presumptive to the British throne, was born April 21, the eldest daughter

of the then Duke and Duchess of York. Her early tutoring was that accorded to all princesses of royal blood in England. After her father ascended the throne as King George VI, her education was revised to fit the princess for her future role as reigning queen of England.

Although the princess was the logical and presumptive heiress to the British throne, she was not entitled to be called Princess of Wales as long as there remained the possibility of the birth of a male heir; nor had she any royal duties, constitutional functions or the right of suffrage. In 1946, the British press hinted at a "budding romance" between Princess Elizabeth and Prince Philip of Greece (a nephew of her cousin, Lord Louis Mountbatten).

Elizabeth, Queen

Queen Elizabeth of Great Britain and Northern Ireland (1900—), youngest daughter of the 14th earl of Strathmore and Kinghorne, K.G., K.T., was born at St. Paul's Waldenbury, Herts., Aug. 4, 1900; she married H.M. King George VI (then H.R.H. the duke of York), April 26, 1923; to them were born two daughters, the Princesses Elizabeth (b. 1926) and Margaret Rose (b. 1930).

Queen Elizabeth and Mrs. Roosevelt on a tour of Washington in June 1939 during the visit of the British monarchs to the U.S.

On May 12, 1937, her majesty was crowned with the traditional ceremonial, after her husband, in Westminster abbey, and took part with the king in the celebrations that followed the event. In the summer of 1939, King George and Queen Elizabeth visited President and Mrs. Roosevelt in Washington and made a tour of Canada. During and following World War II, the queen was active in war and rehabilitation work. (See George VI.)

Emmons, Delos Carleton

Emmons (1888—), U.S. army officer, was born Jan. 17, 1888, in Huntington, W.Va. He was graduated from West Point in 1909 and was commissioned as an infantry lieutenant. Appointed commanding general of the G.H.Q. air force in 1939, he was designated chief of the air force combat command in June 1941. On Dec. 17, 1941, following the Japanese attack on Pearl Harbor, Gen. Emmons was appointed successor to Lieut. Gen. Walter Short as head of the army command of the Hawaiian department.

Employment

In 1939 there were 54,230,000 in the civilian labour force of the United States, and 367,000 in the military personnel. In Aug. 1945 there were 54,350,000 civilian workers and 12,245,000 military personnel; in Aug. 1946, 60,000,000 civilian and 2,812,000 military personnel. Throughout the years of World War II, the withdrawal of civilians into military service was counterbalanced by the addition of new persons to the labour force.

In Aug. 1946, with the war over, there were 4,420,000 more women and nearly 2,000,000 more males than in 1939, plus an unprecedented number of young adults in educational institutions.

The unemployed in 1939 and in Aug. 1945 and Aug. 1946 numbered as follows:

	Maies	remaies	1 otai
1939	5,350,000	1,950,000	7,300,000
1945 (Aug.)	430,000	400,000	830,000
1946 (Aug.)	1,580,000	460,000	2,040,000

The occupational distribution of the civilian employed in the same periods is shown in Table I.

Table 1.—Total Number Persons Gainfully Employed in United States; 1939, Aug. 1945, Aug. 1946

	(Average)	1945	1946
Manufactures		15,019,000	14,586,000
Trade	6,618,000	6,979,000	7,803,000
Finance and service		4,666,000	5,160,000
Government	3,988,000	5,937,000	5,394,000
Transportation and public service		3,860,000	4,000,000
Construction		927,000	2,109,000
Mining	845,000	784,000	829,000

Three facts stand out: (1) World War II had a great impact upon both employment and pay rolls; (2) the index of pay rolls, because of increased earnings per hour and much overtime work, rose more than twice as much as did the index of employment; (3) through 1946, neither employment nor pay rolls dropped back to prewar levels. The enlarged labour supply, which had resulted both from growth of population during the war years and from drawing into the labour market a large number of women and girls not previously a part of the gainfully employed population, was met in 1946 by a demand for labour larger than the prewar period. But there was an increase

of about 1,500,000 in the Table II.—United States: Indexes of Manufacturing Employment: 1937-46 (1030 = 100)

number of unemployed.

Tables II and III give the indexes of manufacturing employment and pay rolls, 1937-46. The sharp recession of employment in 1938, and even greater reduction in pay rolls, which cut wage earners' average incomes in 1938 to below 80% of 1937 levels, was followed by a dramatic rise in both employment and pay rolls from 1941 to mid-1945; followed then by a decline which carried earnings far below 1941-44, during the last half of 1945 and in 1946. The indexes make clear why there was so much discontent about

wages among U.S. wage earners in 1945 and 1946, even though they were still high compared with prewar standards.

From the beginning of the U.S. national defense program in mid-1940 to the summer of 1944 the U.S. labour force would normally have increased about 2,500,000 but, instead, increased 5,580,000. Meanwhile, the armed forces increased 10,590,000. This increase of 16,170,000 in the gainfully employed was supplied by a decrease in unemployment of 7,030,000 and an increase in the labour force of 9,140,000.

The only time during the four-year period when the military drain on manpower caused an actual decrease in the persons available for civilian employment was from April 1943 to April 1944, when a 500,000 decrease occurred in civilian employment and a concurrent increase of 2,620,000 in the armed forces. So far as males were concerned, there was a decline of 3,580,000 in the civilian labour force in the two years, April 1942-April 1944. The female labour force, however, made the unprecedented growth of 3,560,000.

For the four-year period of rapid military recruitment, the net loss of males from the labour supply was only 10,000, although the military recruitment amounted to 10,400,000. The difference was made up by absorption of 5,530,000 male unemployed and a growth of 4,860,000 in the male labour force from youths coming to working age and old men deferring retirement or returning to employment. During the same four years, 1,500,000 females were drawn into employment from the unemployed and 4,280,000 new female wage earners.

Unemployment in the United States fell to unprecedented low figures during the war. (Table IV.) The figure dropped to less than 1,000,000 in 1944 and 1945.

Table IV.—United States: Civilian Labour Force, Military Personnel and Unemployment, 1937–46

Year	Total Civilian Labour Force	Military Personnel	Est. Unemployment	Est. Gainful Employment (Civilian)
1937	. 53,323,000	326,667	10,870,000*	46,295,000

*Census of unemployment est. Subsequent rechecks indicated that this est, was too

The indexes of employment in the principal manufacturing industries are shown in Table V. The reader's attention is called to the enormous increase during the war in the transportation equipment industry; the result of the rapid expansion of aircraft manufacturing; the sharp

collapse in all indexes from 1937-38; and the tendency of consumers' goods industries (like furniture and textiles) to show sharply increasing employment in 1946 as compared with 1945.

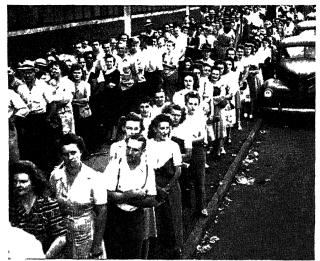

Great Britain.—The total working population of Great Britain increased from 19,750,000 in mid-1939 to 22,281,000 in mid-1943; then decreased to 20,115,000 by June 1946. (Table VI.)

The distribution of the working population between the military and civil defense personnel,

Table V.—United States: Index Numbers of Employment in Manufacturing Industries, 1937-46 (July of each year)

Rubber products	96.2	68.5	78.7	83.5	111.4	101.9	158.9	157.8	160.5	180.2

In 1938 the Bureau of Labour Statistics adjusted their indices to the 1935 census of manufactures instead of to the 1933 census which had been used down to 1937. The indices for 1937 are not exactly comparable, therefore, to those for the subsequent years. The July 1938 index for all manufacturing, based upon the 1933 census, is 76.1; but the index (July 1938) based upon the 1935 census is 81.9. For durable goods the July flg., based on the 1933 census, is 55.8; based on the 1935 census, is 70.3. The effect of the shift to the 1935 census was, therefore, to raise these respective index numbers about 7%.

During the year which ended in June 1946, 1,124,000 women and 330,000 men withdrew from the gainfully employed pop. of Great Britain.

But that figure still exceeded the July 1939 employed pop. by 365,000. There were 140,000 fewer men and 505,000 more women in the labour supply of 1946 than in that of 1939.

The larger number of men still in the armed services, in addition to those killed and physically disabled during the war, caused the shrinkage in the male employable population.

A wide range from maximum to minimum employment occurred in the decade 1937–46. The average unemployment of insured persons in 1938 was 1,168,564 persons; in 1943–44, less than 50,000.

Great Britain experienced lower unemployment after 1940 than it had experienced for many years. (Table VIII).

Canada.—The Canadian government estimated that in 1939 there were 3,370,000 persons more than 14 years of age available for gainful occupations. This number increased to 4,538,000 by

Nov. 1945, and stood at 4,525,000 in Feb. 1946. Most of the increase was in the number of females in the labour market—the figure increased from 638,000 in 1939 to 1,014,000 in Feb. 1946 (Table IX).

Though the armed forces increased from 10,000 in 1939 to 305,000 in 1941, the number of males in employment also increased by 177,000. Thereafter the numbers in civilian employment did not increase noticeably until after the war.

Compiled from tabulations in Ministry of Labour Gazette (London).									

The decrease in unemployment and increase in males available for employment provided personnel for the increase in the armed forces, 1942–45.

The index numbers of employment in manufacturing as a whole are shown in Table X, together with indices for particular industries in 1939, 1945 and 1946. Manufacturing employment expanded sharply during the war but not in proportion to the expansion in the United States.

Endocrinology

By the year 1937 it was possible to divide all the known hormones into two categories, according to whether they were proteins or not. The specific or general chemical structure of the nonprotein hormones was known. Thyroxin and adrenalin had been chemically identified and synthesized. The active principles secreted by the ovary, testis and adrenal cortex were known to be steroids, close relatives of cholesterol and the bile acids. The protein hormones were in process of isolation and purification. Insulin had been crystallized and its nature as a sulphurcontaining protein had been established. The protein nature of purified extracts of the parathyroid gland and of the "factors" separated from posterior pituitary extracts was recognized, although the hormonal nature of the latter was in doubt.

The proteins in active extracts of the anterior pituitary gland had been separated by various methods and, according to the particular extractions and precipitations employed and the biological activities observed, were supposed to include anywhere from 3 to 21 separate hormones.

Chemical Nature of the Hormones.—Research during the decade after 1937 was characterized in the main by a concerted and highly successful attack on the detailed chemistry of the steroids, their derivatives and metabolites; and by the application of the newer methods of protein isolation and purification to anterior pituitary extracts.

Anterior Pituitary.—The growth, thyrotrophic, adrenotrophic, follicle-stimulating, luteinizing and lactogenic hormones were obtained in pure or very highly purified states. They were found to be distinct proteins with characteristic properties such as isoelectric points, mobilities, molecular weights, etc. They exhibited characteristic biological effects. Thus the evidence indicated the elaboration by the anterior pituitary of at least six separate protein hormones.

It seemed likely that more pure fractions would be found, or that certain activities of crude pituitary extracts would turn out to be due to joint actions of two or more of the pure hormones.

Thus the ketogenic activity of crude pituitary extracts could not be accounted for by any of the known purified pituitary proteins.

Certain evidence suggested that similarly derived fractions of the pituitary glands of different species of animals could yield the same biological activities without being identical proteins. It was shown, for example, that the pure adrenotrophic hormones obtained from sheep and hog pituitaries were chemically different. This introduced the possibility of immunologic complications even when pure protein hormones become available for use in the therapy of endocrine disorders.

Posterior Pituitary.—Although the decade 1937–46 advanced knowledge of the chemistry and pharmacology of posterior pituitary extracts, the evidence for the hormonal nature of these effects remained equivocal. The blood-pressure raising and antidiuretic principle was completely separated from the principle which acts on uterine muscle. Both of these purified fractions were found to be polypeptides, having molecular weights between 600 and 2,000. However, a protein with a molecular weight of 30,000 was also isolated from extracts of the posterior lobe. This protein was pure and possessed blood-pressure raising, antidiuretic and oxytocic activities. Moreover, it could be

fragmented to yield smaller molecules each possessing a single activity. It was not settled whether the large protein molecule represented the natural posterior lobe hormone as secreted, or whether it was merely a storage material in the gland which was fragmented before release.

Thyroid.—Despite ample previous evidence that administered thyroxin reproduced all the phenomena of thyroid overactivity, it was demonstrated that the hormone was secreted by the gland and carried in the blood as a thyroxin-diiodotyrosine-protein combination. It was also shown that the hormone was carried mostly in the alphabeta globulin fraction of the blood.

A more startling development was the discovery that proteins containing tyrosine (plasma proteins, casein, etc.) could react in vitro with iodine to form hormonally active substances. Furthermore, this in vitro iodination of proteins was shown to result in the formation of thyroxin. This was the first demonstration that a hormone could be produced in the blood and tissues generally, and indicated the possibility that a hormone may precede its gland in the evolutionary scale. However, the thyroid gland seems to justify its existence by being a much more efficient producer of thyroxin, and by being subject to physiological regulation.

Based on the above and other evidence, the concept of thyroxin synthesis at the end of the decade was that iodine ingested with the food is quickly taken up by the gland, reacts with the tyrosine of the cell proteins, and forms diiodotyrosine and thyroxin. These substances are kept in the follicles of the gland in the form of a complex with a globulin of a molecular weight up to 700,000. The hormone is released from the gland by proteolytic splitting of this huge molecule into smaller fragments which are carried with the plasma proteins.

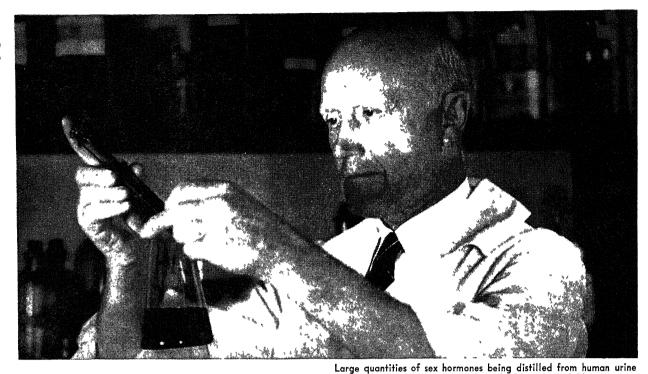

Parathyroid.—Beyond the fact that the activity of the parathyroid hormone is associated with a protein fraction, no other precise data concerning its chemistry came to light during the decade.

Adrenal Cortex.—The biologically active substances produced in the adrenal cortex had first been characterized as steroids in 1936. Later it was shown that this gland produces a series of steroid compounds, classifiable roughly into three groups. The C₁₁ steroids, possessing an O or OH group on the 11th carbon atom, were found to affect the metabolism of the foodstuffs. Desoxycorticosterone exerted the most marked influence on the excretion and distribution of sodium and potassium by the body. The third group consisted of steroids identical with or related to the hormones of the gonads.

In addition, when adrenal cortical extracts were fractionated an amorphous residue remained which was not identified at the end of the decade, but which is biologically quite active when tested by the criterion of the survival of adrenalectomized animals.

A considerable number of adrenal cortical steroids were chemically identified and synthesized, including one of the C_{11} group, which had resisted the efforts of the chemist for many years.

The Gonads.—The decade witnessed an enormous development in the chemical determination of various derivatives of the steroid hormones of the ovary and testis. The metabolic pathways followed by the sex hormones were closely studied, and certain general principles evolved. It appeared that the precursor of all steroid hormones was most probably cholesterol, which is itself built up from acetic acid. In the case of progesterone (strictly speaking

by Prof. Fred Conrad Koch of the University of Chicago

It was
sternids eniphyseal cartilage. This allows the lengthwise ex

of its excretion product, pregnandiol) this was shown conclusively by using isotopically marked substances. It was also found that many of the biologically active steroids were inactivated by the liver (by oxidation or complete destruction) or were made ready for excretion by conjugation with glucuronic acid, sulphate, etc.

It was proved that the adrenal cortex can elaborate sex active steroids, by the isolation and identification of such compounds from the gland itself, and from the urine of patients suffering from adrenal hyperfunction or tumour.

A novel departure in endocrine physiology was the demonstration that chemical compounds could be prepared which possessed estrogenic activity, and yet were not structurally related to the naturally occurring hormones. An example was stilbestrol, which came into common therapeutic use in patients requiring treatment with estrogens. Such phenomena pointed to the possibility that the criteria of chemical relationships might have to be changed or that biological specificity was not as rigid as formerly imagined.

Influence of the Endocrine Glands on Growth.—The work of Pierre Marie, Harvey Cushing and H. M. Evans had established the predominating influence of the anterior pituitary gland on growth. It was known that removal of the gland stopped further increase in body length; while the administration of pituitary extracts to hypophysectomized animals prevented the stunting which would otherwise occur and under suitable conditions, might even produce supernormal growth. During the decade 1937–46, the growth hormone was purified to the extent that no significant amounts of the other pituitary factors were present. This made it possible to study the uncomplicated action of this hormone, and to obtain a clearer view of the role of other endocrine factors in the regulation of growth.

Growth involves two main phenomena—an increase in the active protoplasmic mass and an increase in body length. The increase in protoplasmic mass depends upon the retention of nitrogen to support an increased rate of synthesis of cell proteins. The increase in body length, which occurs consequent to pituitary activity, depends upon a stimulation of cell growth and proliferation in the

epiphyseal cartilage. This allows the lengthwise expansion of the bone behind the proliferation centres. In normal animals this does not proceed indefinitely. The formation of bone overtakes the expansion of cartilage, bony fusion occurs and further growth in length ceases.

As regards nitrogen retention, it was found that the thyroid gland works synergistically with the growth hormone. This is probably due to the influence of the thyroid hormone on the energy level of the cell. The synthesis of proteins requires energy, which has to be supplied by energy-yielding reactions in the course of the degradation of other foodstuffs. Thus, an effective metabolic rate is essential for an optimal rate of protein synthesis. The testicular steroids were also shown to favour nitrogen retention, especially in skeletal muscle. However, since both thyroid hormone and testosterone have a tendency to close the epiphyses prematurely, they act as opposing influences to the growth hormone with respect to growth in length.

It was demonstrated that the adrenotrophic hormone of the pituitary, via the adrenal cortex, stimulates protein breakdown and thus opposes the influence of growth hormone on nitrogen retention. In fact, it was possible to neutralize completely the effect of growth hormone by suitable doses of the adrenotrophic factor. Insulin was shown to be essential to protein synthesis, for in its absence the administration of growth hormone resulted in an increased excretion of nitrogen rather than in nitrogen retention.

It became apparent that the growth hormone of the anterior pituitary was only one of a number of endocrine factors concerned with protein synthesis in an interrelated fashion. However, with respect to its influence on growth in bone length, the pituitary could with more justice be considered to originate the growth hormone, since it was shown to be able to exert this effect in vivo when other hormones were absent.

Regulation of Endocrine Secretion.—The general principles established prior to the decade 1937–46 were more or less confirmed and amplified. An outline of the status

of knowledge and thought in this field at the end of the decade could be classified into four categories, as follows:

- (1) The stimulating (trophic) action of various anterior pituitary hormones upon other glands (thyroid, adrenal cortex and gonads).—The mechanism by which these effects occur is considered to be specific stimulation of growth and proliferation of the secretory cells of the affected glands, which in the normal course of events results in increased production of hormone. The latter result is not a necessary event, since it was demonstrated that the pituitary causes thyroid hypertrophy even when the production of thyroxin is blocked by thiourea.
- (2) The inhibitory action of hormones of other glands on pituitary secretion.—The trophic effects of the hormone of the anterior pituitary are self-limiting because when the hormones of the other glands reach the pituitary in sufficient concentration, the pituitary is inhibited. This is part of the homeostatic machinery by which the "endocrine balance" is maintained.
- (3) Influence of metabolite concentration on endocrine secretion.—The oldest known action of this kind is the influence exerted by the level of the inorganic iodine of the blood upon the structure and function of the thyroid gland. It was also shown that a fall in blood calcium leads to overactivity of the parathyroid, that a rise in blood glucose stimulates insulin secretion, and that a fall in blood glucose leads to release of adrenalin from the adrenal medulla.
- (4) Nervous regulation of endocrine activity.—The influence exerted by the nervous system upon the endocrine glands is of two kinds. The posterior pituitary gland and the adrenal medulla are direct outgrowths of the nervous system and are continually under its direction. Interruption of nervous pathways to these glands leads not only to secretory inactivity but also to atrophy. While the other glands are not as directly ruled by the nervous system, certain functional relationships are known. For example: (a) It was shown that the thyroid gland reacts to environmental cold only if the connection between the hypothalamus and the pituitary is intact. (b) In birds, light via the retina of the eye sets up nerve impulses which affect the pituitary, and ovulation is thereby stimulated. In this way the seasonal variation in the amount of natural light can account for the characteristic reproductive cycle. (c) In certain animals, like the rabbit, ovulation occurs only when a suitable stimulus to the cervix of the uterus is transmitted via the nervous system to the pituitary. This stimulus evokes the release of luteinizing hormone from the pituitary, which in its turn influences the ovary to release an ovum. (d) Experimental stimulation of the splanchnic nerves (or the injection of adrenalin) causes a release of adrenal cortical hormones into the blood. (e) The interruption of the normal menstrual cycle by emotional stress is an old clinical observation. It was shown that such amenorrhoeas could be relieved by the administration of prostigmine, that is by parasympathetic stimulation.

It had long been known that anoxia results in a rise in the blood sugar level. This was attributed to the effect of anoxia on the nervous system, which stimulates the adrenal medulla to release adrenalin. However, a more careful analysis of this phenomenon showed that anoxia still affects the blood sugar even in the absence of the adrenal medulla, except that instead of causing a rise it causes a fall in the level. When both the adrenals and the pancreas are removed, anoxia produces no change in blood sugar level. It appeared that the sympathetic-adrenal mechanism and the vago-insulin mechanism are both stimulated by anoxia, and that the central nervous system may under

certain conditions regulate insulin as well as adrenalin secretion. There was evidence suggesting that the hypothalamic area is the important centre for neuroendocrine interrelationships.

Influence upon Sex Development.—The wealth of data on the chemistry and physiology of gonadal steroids accumulated during the decade made it possible to study the relation between these steroids and those of the adrenal cortex. It was also possible to define more precisely the actions of the gonadotrophic hormones of the pituitary.

Three gonadotrophic factors were shown to play a role in the development of the ovary, and the maintenance of the normal female sex cycle. The follicle-stimulating factor leads to growth of the primitive follicle to the stage and size which obtains just before ovulation. The luteinizing factor promotes ovulation and the beginning of the transformation to the *corpus luteum*. Prolactin or the luteotrophic factor maintains the *corpus luteum* and promotes the secretion of progesterone.

It was shown that estradiol and estrone are partly inactivated and destroyed in the liver. This occurs partly by conjugation with glycuronic acid and with sulphate, partly by transformation to a steroid of much lower potency. Menstruation follows from the withdrawal of steroid hormones, which in some way affects the spiral arteries of the uterine lining. These blood vessels break, and the result is bleeding and desquamation of tissue.

It was increasingly realized that normally spaced cycles can exist in the absence of ovulation and corpus luteum formation. It became important to develop criteria for determining the occurrence or absence of ovulation. The previously known cyclical changes in the vaginal mucosa were studied in further detail. It was also demonstrated that the accurate daily body temperature, taken under basal conditions throughout the cycle, exhibits a characteristic curve which indicates the day of ovulation by a sudden sharp rise in temperature. The simultaneous employment of the vaginal smear and body temperature techniques proved to be very helpful in the diagnosis and treatment of sterility and other disorders.

Previous clinical experience had indicated the value of thyroid hormone in the treatment of diminished sex function, such as irregular and absent menstruation, sterility, lack of sexual development, etc. These clinical findings were elucidated by animal experimentation. It was shown that thyroidectomy inhibits ovulation of mature ovarian follicles, and that the administration of thyroid releases the luteinizing hormone from the anterior pituitary and causes ovulation and the formation of corpora lutea.

It was found that in the male the follicle stimulating hormone leads to the normal development and maintenance of that portion of the testis which produces the sperm. The luteinizing factor leads to the maintenance of the interstitial or Leydig cells which produce testosterone, the male sex hormone. This steroid is partly destroyed and partly converted to androsterone and similar compounds. The adrenal cortex normally produces sex steroids, mainly of the male variety, which accounts for the masculinizing effects of tumours or hypertrophy of the adrenal cortex. The metabolic products of the male sex hormones are usually steroids with a keto group on the 17th carbon-atom of the molecule. Practical methods for the chemical determination of the 17 ketosteroids were devised, and it was established that their concentration in the urine correlated well with the rate of production of the male sex hormones.

Influence upon the Metabolism of Foodstuffs.—The

rapid development of enzyme chemistry and the knowledge of intermediary metabolism gained from it, affected the concepts concerning the action of hormones upon metabolism. It became evident, from the order of magnitude of the effective doses of the hormones, that they most probably acted by influencing the rates of reaction of key enzyme systems. Although the precise loci of action of any of the various hormones were not ascertained, the indirect knowledge gained during the decade made certain conclusions very probable. Thus, it was shown that glucose can be utilized for storage and oxidation in the complete absence of insulin. However, insulin enables both processes to proceed at more rapid rates at any given blood sugar level than occur in the absence of insulin. From this and other work it appeared that insulin increases the rate of glucose phosphorylation, which is the first step in its transformation to glycogen or in its dissimilation to carbon dioxide and water. This conclusion was also supported by evidence derived from work with radioactive phosphate.

When food was withheld from experimental animals from which the pituitary or adrenal cortical glands had been removed, there was a marked fall in the blood sugar level accompanied by a decrease in nitrogen excretion, a virtual inhibition of the breakdown of fats to ketone bodies and a reduction in the basal metabolic rate. In other words, it was demonstrated that such animals were unable to transform their stored food materials into the immediate fuel substances of the body, namely glucose and the keto acids. However, it was also shown that hypophysectomized or adrenalectomized animals can use ingested proteins as effectively and as quickly as do normal animals, although ingested fat has no advantage over stored body fat. Since proteins taken by mouth are broken down in the gastrointestinal tract to amino acids and absorbed as such, it was concluded that the pituitary and the adrenal cortex exert their influence on the initial stages of the breakdown of proteins and neutral fat and are not concerned with the transformation and use of the amino acids. This influence of the pituitary is exerted, in part at least, through the thyroid gland. For it was found that the blood sugar level and the nitrogen excretion of fasted hypophysectomized animals could be restored to normal by the administration of thyroid hormone.

The availability of the various hormones for experimental work led to the substantiation and elaboration of the concept of the "endocrine balance" in more specific terms than was previously possible. Thus the synthesis of proteins is promoted by insulin, by the growth hormone in the presence of insulin and by testosterone. (There were good grounds for the assumption that the action of insulin is due to its effect in increasing the turn-over of adenosine triphosphate, which is the probable energy donor for the formation of peptide bonds.) These anabolic influences are opposed by the thyrotrophic and the adrenotrophic hormones via thyroxin and the C11 steroids, which promote the breakdown of protein to amino acids. The production of fat from carbohydrate is promoted by insulin and opposed by the pituitary, thyroid and the adrenal cortex. Insulin leads to muscle glycogen storage, while the thyroid and the adrenal medulla favour glycogen breakdown.

From this same standpoint, experimental and clinical diabetes came to be regarded not as a pancreatic disturbance but as an upset in the endocrine balance. In the absence of insulin, the effects of the other glands become predominant, leading to excessive breakdown of storage materials and an oversupply of glucose and keto acids. This raises the level

of the latter substances in the body fluids, and eventually spills them over the kidney dam. The so-called diabetogenic effect of the anterior pituitary gland is due to the joint action of several hormones. The adrenotrophic factor stimulates the adrenal cortex, the thyrotrophic factor activates the thyroid. The growth hormone evokes a reactive stimulation of insulin secretion and upon massive and long continued administration, leads to degeneration of the insulin producing cells of the pancreas. It was not known at the end of the decade whether ketone production was governed by a separate ketogenic pituitary hormone. The endocrine balance also offers a ready explanation for the insulin sensitivity following removal of the pituitary or adrenal cortex, and for the sensitivity of the depancreatized animal to the C11 adrenal steroids and the metabolic factors of the anterior pituitary.

Mineral Metabolism.-Brief mention was made previously of the influence of desoxycorticosterone, one of the adrenal hormones, on the metabolism of sodium and potassium. The manner of its action was elucidated to some extent by following the time sequence of the redistribution of sodium and potassium in the blood and tissues of animals treated with this hormone, and of animals from which both adrenal glands had been removed. From these observations it was concluded that the adrenal cortex affects the kidney tubules and promotes their ability to reabsorb sodium, and thus conserve it. The changes noted in the body fluids and tissues appeared to be secondary to the kidney mechanism. Steroids other than desoxycorticosterone, and not derived from the adrenal cortex were shown to exert similar, though less marked, sodium retention effects. Among these were estradiol, testosterone, progesterone and pregnandiol.

Of the other mineral substances in the body, calcium and phosphate were shown to be hormonally regulated. The mechanism of action of the parathyroid gland in mobilizing calcium from bone was not completely clarified. However, it was shown that the effect could still be obtained in the absence of both kidneys. Therefore, the increased calcium excretion is not the primary effect of the hormone. The blood calcium raising effect of the estrogenic hormones, demonstrated especially in birds, was invoked to explain certain types of osteoporosis occurring in women suffering from a deficiency of these hormones after the menopause. However, no explanation of the mechanism of these effects was brought forward.

It had been known that insulin administration lowers the level of inorganic phosphate in the blood and diminishes the urinary excretion of phosphate. This was shown to be due to the promotion by insulin of the esterification of the blood inorganic phosphate to some compound which was still unknown at the end of the decade.

Nutrition and Glandular Activity.—It might be expected that general or specific nutritional deficiencies would affect the endocrine glands as they do all the other tissues of the body. However, certain specific relationships were uncovered between nutritional disturbances and particular glands. Thus, it was found that early in the course of B-complex deficiency there occurs a lack of the gonadotrophic hormones, which leads to disturbances in the sex cycle. The adrenal cortex is injured in pantothenic acid deficiency; and the spermatogenic apparatus of the testis suffers when there is a lack of vitamin E or of the amino acid, arginine.

The syndrome of anorexia nervosa begins with a loss of appetite due to a severe emotional disturbance. It was shown that as the disorder progresses, symptoms and signs of pituitary hypofunction appear. A stage is finally reached

which is indistinguishable from the disease picture which follows destruction of the pituitary gland. In other words, in anorexia nervosa a lack of nutritional elements leads to the same loss of pituitary function as can be caused by tumour, haemorrhage or infection.

Animal experiments and clinical observations revealed that thyroid hyperactivity may cause nutritional deficiencies, with consequences previously ascribed to the direct action of the thyroid hormone. Thus it was shown that the marked muscular weakness, the low liver glycogen and the prolongation of the sex cycle seen in hyperthyroid states, could be prevented by the administration of large amounts of the vitamin D complex. Vitamin D was found to prevent the negative calcium balance which follows thyroid administration. Apparently, these secondary vitamin deficiencies are due to the increased rate of excretion and destruction of supplementary substances, because of the rise in general body metabolism. What is adequate for the normal organism becomes inadequate for the hyperthyroid individual.

Specific Inhibitors of Glandular Activity.-Three separate and seemingly unrelated observations made within a short time of each other led to the discovery of a series of substances which inhibit the formation of thyroxin by the thyroid gland. It was first shown that rabbits fed rapeseed developed goitres. This was found to be due to the allylthiourea contained in that feed. Phenylthiourea administration to rats also led to thyroid enlargement. The same effect was obtained from the chronic feeding of some of the sulfa drugs. It was then demonstrated that all these substances interfere with the formation of diodotyrosine from tyrosine and iodide. This results in a lack of the thyroid hormone, leading to the development of hypothyroidism. As the level of the thyroid hormone decreases, the pituitary is stimulated to increase its output of the thyrotrophic factor. This results in the production of hyperplastic goitres which, however, do not secrete any thyroid hormone. These findings were applied clinically in the treatment of hyperthyroidism. The substances used in human therapy were thiouracil or one of its derivatives. But such treatment remained largely experimental in nature, because of a certain percentage of toxic effects.

An isolated observation in 1937 showed that alloxan produced hypoglycaemia in rabbits. Six years later this observation was confirmed; but it was also shown that, when such animals survived the hypoglycaemic attacks, they went on to develop a permanent diabetes. It was found that this was due to the specific effect of alloxan upon the beta cells of the pancreas. The first effect of the drug is to release the insulin present in the pancreas, then the cells degenerate and are eventually replaced by fibrous tissue. Alloxan, therefore, became a very useful tool for the study of diabetes in such animal species in which it is difficult to perform a pancreatectomy, either because the animal is very small or because its pancreas is dispersed over the mesentery. The use of alloxan gave promise also of leading to an analysis of the separate functions of the alpha and beta cells of the island of Langerhans, since the alpha variety is not affected by alloxan.

Clinical Applications.—Parallel with the development of the theoretical side of the subject, the decade 1937–46 witnessed some growth in the clinical aspects of endocrinology in regard to diagnosis and therapy.

Because methods for the quantitative chemical determination of proteins had not been developed, the estimation of the blood and urine levels of the pituitary protein hormones perforce remained a bio-assay procedure. The usefulness of biological assays was limited by their consid-

erable degree of variability. Nevertheless, much valuable clinical information was obtained from the estimation of the gonadotrophic factors in blood and urine. A large amount of data was available concerning the behaviour of these hormones during the normal menstrual cycle, in pregnancy and its disorders and in gonadal deficiency of both sexes.

Extensive work was done elucidating the significance of the various iodine fractions of the blood. It was demonstrated that blood iodine exists in three forms—inorganic iodide and two separable fractions of protein-bound iodine. Further research revealed that the level of protein-bound iodine varies directly with the height of thyroid function. Thus, protein-bound iodine probably represents the amount of circulating thyroid hormone and, as such, is a more direct index of the activity of the thyroid gland than had previously been available.

Adrenal cortical activity was measured by determining the protective effects of the urine of patients against the lethal action of cold in adrenal ectomized animals. This protection is a function of the concentration of the C_{11} steroids.

The androgenic steroids were measured by a colorimetric procedure, which determines those hormones from the adrenal cortex and the gonads, which have a keto group on carbon atom No. 17.

The female sex hormones were assayed both chemically and biologically. It was demonstrated that their excretion gradually rises during normal pregnancy, and exhibits a sudden sharp fall shortly before labour. It was also found that in abnormalities of pregnancy, such as abortion and toxaemias, the level of steroid hormones of blood and urine falls sometime before the onset of symptoms. About 10% to 20% of secreted or administered progesterone is changed to pregnandiol and excreted in that form. The first methods for the estimation of the latter were difficult and time consuming. A simple colorimetric procedure was then devised, making it possible to follow pregnandiol excretion (and hence progesterone production) very closely. It was shown that the presence of pregnandiol in the urine of women after a missed menstrual period signifies pregnancy.

This test, therefore, might be used to replace the biological tests for pregnancy.

The field of endocrine therapy was enlarged during the decade by the synthesis of desoxycorticosterone and of orally active preparations of male and female sex hormones. Clinical use of pituitary preparations continued to be unsatisfactory chiefly because it was not possible to make them sufficiently potent or sufficiently pure. 236 English Literature

Few periods in the history of English literature had seen so much change, experiment and counterexperiment as the first four decades of the 20th century, and, viewed from a certain distance, it would appear that the pace of this movement increased during the years between the end of World War I and the end of World War II. It was too soon in 1946 to say whether the manifold activity was evidence only of a restlessness in the creative intelligence induced by the instability, the danger and the increasing complexity of civilized life during the period or was inspired by a general rise in vitality caused rather by the spread of popular education and the gradual raising of standards in cultural diffusion which were so particularly marked in the years 1937-46; but no one could deny that one of the dominant problems for the writers of those years was the interaction of public events and the artistic impulse, the degree to which they should allow their work not merely to be coloured by the political, social and international turmoil surrounding them but even to enter the service of opposing factions and ideologies at a time when the basic fabric of civilized life seemed to be in question.

Viewed from this aspect, the striking feature of English literature between 1937 and 1946 was the way in which writers managed to maintain the traditional responsibilities and liberties of intellectual and imaginative expression without losing a contemporary awareness or, in the moments of deepest crisis, a national solidarity. This was all the more remarkable during an epoch when in many other countries the stress of external events led to the political regimentation of writers, or in some cases to their willing acceptance of the role of propagandists and in others to the definite dissociation, in the vision of poet or novelist, of the individual from the claims of his time and place.

Notable also was the fact that, in comparison with the period between 1914 and 1919, these years, six of which were for the nation as a whole war years and the remainder years in which the more adventurous or unfortunate could find death in armed conflict in one part of the world or another, were responsible for many fewer casualties among the writers. John Cornford and Julian Bell, both poets of promise, were killed in the Spanish war; Robert Byron, a scholar and author of some individual travel books, was drowned on active service; Alun Lewis and Sidney Keyes, two young poets of whom much was expected, also met their deaths on active service for their country; but there were very few others of outstanding gifts among the English poets who lost their lives, and none among the novelists. Virginia Woolf, the most original woman novelist of her generation, died in 1941; but her death could in no way be ascribed to the accidents of war; nor could those of two other novelists, Hugh Walpole and L. H. Myers, and two poets, W. H. Davies and Robert Nichols. Two Irish men of letters must be added to this record of loss: the great poet and dramatist W. B. Yeats, who died a few months before war broke out, and James Joyce, perhaps the most widely discussed and influential novelist of his generation, who died in neutral Switzerland in the middle of hostilities; the Englishman H. G. Wells, who had probably made a deeper mark on the thought of the times than any other single writer, died after long illness in 1946.

The Poets.—The most notable achievements in poetry during those ten years from the older generation of writers who had already made their name in the 1920s were, after the death of W. B. Yeats, those by T. S. Eliot and Edith

Sitwell. Work of high distinction was also published by Walter de la Mare, Lawrence Binyon, Robert Graves, Edmund Blunden, Edwin Muir and Robert Nichols; and a collected edition of W. H. Davies' poems appeared after his death, in 1942. Among the generation of writers who had come into prominence in the early 1930s, the work of W. H. Auden, Cecil Day Lewis, Louis MacNeice, Stephen Spender, Ronald Bottrall and Dylan Thomas still held the limelight, though Auden left his native shores early in 1939 to become a U.S. citizen and the other four were occupied during a great part of the war with various official or semiofficial duties. Collections of poems which also attracted much attention came from George Barker, David Gascoyne, John Betjeman, William Empson, Kathleen Raine and Roy Campbell, each with a distinct and individual talent owing little or nothing to popular modes.

New names were legion, and at one period during the war it seemed as if almost any young man or woman who could put a few rhyming (or unrhyming) lines together could gain a hearing. This "boom" did not last long, however, and only a handful of them survived the critics' and the public's second thoughts. Those who appeared most promising, apart from the two poets killed in the war, Alun Lewis and Sidney Keyes, included W. R. Rodgers, F. T. Prince, Laurie Lee, Henry Reed, Terence Tiller, Norman Nicholson, Peter Yates, Lawrence Durrell, Alex Comfort and Roy Fuller-the last-named being the only one among them whose work could be strictly considered as war poetry. Mention should also be made of a group of poets, more interesting for their intention and direction than for their actual achievement, who called themselves "the Apocalypse" and turned sharply away from the political and social preoccupations that had, for a time at least, been a marked characteristic of the poets of Auden's generation. The most forcible talent among these was that of Henry Treece. Finally, no record of the memorable poetry of the time would be complete without the name of Demetrios Capetanakis, a young Greek who travelled to England just before World War II and wrote a number of unusually remarkable poems in English before his death in 1944.

T. S. Eliot had won for himself a reputation as one of England's most original and influential poets in the early '20s with The Waste Land. His poems and critical essays during the '20s and '30s consolidated that reputation and established him as a writer of powerful intelligence who was concerned, whether he wrote in verse or prose, with exploring and elucidating the central significance of western civilization and the position of modern man in relation to that historical tradition and in relation to God. His major poetical work during the decade 1937-46, Four Quartets, recorded an important further advance in this philosophical quest and an impressive development of his poetical powers. Four Quartets is a sustained meditation on the meaning of time in men's lives and its relation to eternity. It is a work of the most elaborate yet harmonious structure, full of subtle thought illuminated by imagery of great beauty and force. Eliot's theme may be stated as the belief that the ordinary time of life, the "time of chronometers," is of only illusory significance compared with the irruption of eternity into experience, and that the highest calling that man can have, the aim of both mystic and artist, is to train himself to be aware of these points of "intersection of the timeless with time." No other poet of those years could bring, as Eliot brought in Four Quartets, such a sense of the past and its accumulated intellectual and imaginative experience to bear upon the present.

Edith Sitwell was also well known for her poetry before 1937, but though it had been always highly original and

striking, her art made a leap so sudden and so remarkable at the outbreak of war that it was difficult at first sight to see the connecting links between the earlier and later phases, though they were undoubtedly there, especially when the early poems were viewed as training for the later poems in technique and the daring association of symbols. It was in Gold Coast Customs, published some years before the outbreak of war, that the signs of imminent change could be traced. The world outside the enchanted garden of her early poems had broken in, with all its pains and struggles, and produced a long work of almost savage force, the rhythms as insistent as tom-toms, in which a fanciful description of native African customs is the cloak for a passionate satire on the heartless world of the powerful who exploit the powerless. Edith Sitwell's agonized apprehension of human misery, which beats so strongly under this poem, grew even stronger and more fruitful artistically when the barbarities of international war were let loose. The result was two books of poems, Street Songs and Green Song, which displayed a new and completely assured "grand manner," where the poet whose work had previously been the delight of the limited circle who could appreciate her special wit and fantasy became a voice for all the bewilderment and suffering of a ruined generation. The outstanding quality of this later poetry of Edith Sitwell's was the noble compassion that informed its utterance and controlled its music, and next to that the skill with which she assembled the symbols, creating in the framework of a single poem, which might not be more than 100 lines in length, the sense of space in the universe reaching to the farthest stars and time reaching back through the earlier epochs of Christian civilization to the classical world and beyond that to the very dawn of life. Street Songs and Green Song must be counted as an unique act of courage and faith in the face of the powers of destruction that raged with such violence while the poems were being written.

When viewing the work of the poets of the middle generation as a whole, one could not fail to be struck by the consistency of the intellectual evolution through which most of them went. At the time of the Spanish Civil War the sympathies of Auden, Day Lewis, Spender, MacNeice and their fellow poets, openly declared in their poetry, were with the Spanish republicans and the world-wide antifascist movement. They believed that the social, political and international disorders which they saw around them could be remedied by political action, in fact by revolutionary political action. By 1940, however, a certain disillusionment with the outcome of the Spanish war and the behaviour of the revolutionary parties of the left, together with a growing feeling that the will to resistance against fascist Germany cut right across class differences in Britain, led to a revulsion from the kind of poetry that the French had called "engaged." The sense of indignation and pity before injustice and human suffering, however, remained, and it was noteworthy that throughout World War II it was this human standpoint that was dominant and that nowhere in the work of poets of any distinction did a note of national bombast or partisan hatred creep in. Even under the bombs it was the tragic situation of humanity as a whole that preoccupied these poets, and the value of the life of the spirit before the challenge of terror and death.

This note was also characteristic of the majority of the poets, roughly between the ages of 20 and 30, who actually served in the armed forces and were posted abroad with the army, navy or air force. Outstanding among these were Alun Lewis, Sidney Keyes and Roy Fuller. All three were of left-wing political outlook and had therefore ideological

as well as patriotic reasons for fighting; nevertheless, neither the invective of hatred nor appeals to honour and glory found any place in their works; instead, there was above all a sense of the catastrophe to civilization that the war had precipitated and of the tragic situation of men of good will in the midst of it and an especially poignant feeling of sadness in the loss of what youth has a right to enjoy, love first and foremost, and the promise that love holds out of its growth in the peaceful rhythm of life. The poetry written by English poets during World War I was essentially a poetry of trench warfare and the ruined, mud-sodden landscapes of the western front. In the more complex and totally organized war of 1939-45, the poetry written by young men serving in the forces was deeply affected by many different forms and places of action: the impact of India on Alun Lewis was as marked as that of East Africa on Roy Fuller, and some of Sidney Keyes's finest work prefigured the desert where he eventually met his death. Keyes was by many years the youngest of the three and showed a feeling for music, rhythm and texture in his verse that was truly astonishing in a poet at the beginning of his career. In maturity of thought and the power of communicating direct feeling, both Lewis and Fuller were his superiors, but neither had quite his remarkable virtuosity; both in fact gave the impression that prose might eventually turn out to be their preferred medium. The stories that Alun Lewis wrote toward the end of his life showed a rapidly developing talent, and one story, Ward 'O'3 (b), was among the dozen or so best stories of the war published before the end of 1946.

The 'gos saw a number of interesting experiments in poetic and partly poetic drama; of the most outstanding achievements in this form, the first place must undoubtedly be given to The Family Reunion by T. S. Eliot, a brilliant essay in the combination of the atmosphere of Greek classical drama with a modern scene and situation, and in the writing of verse that could move without awkwardness from colloquial simplicity to the heights of dramatic and imaginative tension. The collaboration of W. H. Auden with Christopher Isherwood which had been responsible for several plays in the early '30s produced two more between 1936 and 1939, in a genre which was a mixture of charade, masque and expressionist drama: The Ascent of F6 and On the Frontier. Stephen Spender's Trial of a Judge had more poetic intensity than either, though the lighter element was altogether lacking in a sombre study of the dilemma of the liberal conscience in a totalitarian age. Several poetic dramas were written during World War II, including The Assassin by Peter Yates, The Old Man of the Mountains by Norman Nicholson and This Way to the Tomb by Ronald Duncan. Mention should also be made of two plays in verse written for radio production and subsequently published in book form: The Rescue by Edward Sackville-West and Christopher Columbus by Louis MacNeice.

Fiction.—The latter end of the decade 1937–46 appeared barren when fiction is considered. Virginia Woolf, James Joyce, Hugh Walpole and L. H. Myers were all dead before World War II had ended; Aldous Huxley had been so long in the United States that he scarcely seemed to belong any longer to the literary world in the country that had been thrown so largely on its own resources during the years of siege; and he and his younger contemporary Christopher Isherwood, who had left for the United States in 1939 with W. H. Auden, appeared to be more concerned with the problems of mystic religion than-those-of

238 the craft of fiction—a preoccupation that also touched one of the most successful and established of English story writers, Somerset Maugham, in the same transatlantic climate. Only E. M. Forster was left of the "old guard," but the silence which he had preserved as a novelist ever since the publication of A Passage to India in 1924 continued unbroken even by short stories ("The Eternal Moment" appeared in 1928).

A younger generation held the field, with the popular J. B. Priestley a little apart, older than most of them and devoted perhaps as much to the drama as to the novel. An interesting fact about two of the most prominent among them, Evelyn Waugh and Graham Greene, was that both allowed their adopted religion, Roman Catholicism, distinctly to colour their work but still maintained their hold on the public in a predominantly Protestant country. Among the women novelists, three in particular should be mentioned for highly-wrought craftsmanship and the steady development of their gifts: Elizabeth Bowen, Ivy Compton Burnett and Rosamond Lehmann. Among the rest who were already known before 1937, a small number strikingly increased and consolidated their reputations, including Henry Green and Rex Warner. The same must also be said of V. S. Pritchett, although his chief medium during these years was the short story, and much of his time was devoted to critical writing, in which he displayed an extraordinarily wide reading and an unfailing zest and percipience of approach. A. J. Cronin, Storm Jameson, Robert Graves, Joyce Carey, F. L. Green, Walter Allen and

James Joyce's last published work, Finnegans Wake, appeared in 1939, two years before his death in Zurich, Switzerland. The Irish-born writer is shown here with his grandson

L. P. Hartley all produced notable work in the novel; Frank O'Connor, T. O. Beachcroft and James Stern in the short story; but new names were rare, and few of them attracted more than passing attention, the most promising including Nigel Balchin, Richard Llewellyn, Philip Toynbee, P. H. Newby, William Sansom, Mary Lavin and Denton Welch. This brief list does not include writers whose theme directly and predominantly was the war itself. Among the latter, C. S. Forester, Nevil Shute, H. E. Bates, Anthony Thorne and John Sommerfield were all known as writers of fiction before the war, but Gerald Kersh and Iulian Maclaren Ross made their first distinct mark with their novels and stories of the soldiers of the new English

Many other young men in the services wrote notable single novels or stories but laid no certain claim to be considered literary artists with a future.

James Joyce completed the second great novel of his life, Finnegans Wake, before war broke out. He was dead a few years later, and it stood as the testament of one of the most astonishing intellects of the age, a work of a brilliance, a complexity and sustained artistry that no other writer of his time could hope to rival. It was at the same time of such abstruseness of argument and difficulty of language that it was likely to remain one of the least read masterpieces ever written; but of the underlying seriousness of purpose, of the immense care, erudition and sense of the evocative possibilities of words that had gone to its making no one could doubt who had taken the trouble to examine its structure and open his sympathies to its mysterious power, or who had heard the records of certain passages recited by the author himself. As Ulysses was the presentation of the actions, thoughts and feelings of a Dubliner, his family, friends and associates during a single summer's day, so Finnegans Wake was the complementary presentation of another Dubliner's dreams and half-dreaming fantasies, memories and sensations in the course of a single night's rest. It was of immense length and took the author 17 years to work into a shape that satisfied him, in which his sleeping publican should become a symbol of the whole subliminal existence of humanity.

Virginia Woolf completed two of her most remarkable works between 1936 and her death in 1941: Roger Fry: A Biography and Between the Acts. In addition, two collections published after her death and during the war, one of essays under the title of The Death of the Moth and one of short stories and sketches under the title of The Haunted House, must rank among the most notable expressions of her genius. In Roger Fry she was writing the biography of a distinguished exponent and critic of another art and a personal friend, and she accomplished this difficult task with an admirable blend of objectivity and sympathy, allowing the subject as far as possible to tell his own story through letters and journals. Between the Acts was completed, though neither was finally revised nor published, scarcely more than a few days before her death. It mattered little that it was never given its last polishing and that rough corners still stuck out of it; and though the time and place of this novel were precise-the southern English countryside and the late summer of 1939-its message was likely to be as fresh 50 years later as when it was written. It is impossible to analyze all its symbolism in a short space; but in this vision and parable of English history which is at the same time something more universal, Virginia Woolf seemed to suggest that even the terrifying events of that moment, symbolized by the bombers which suddenly roar overhead and drown the speakers in the pageant, fit into a single and ancient pattern of life. The

Virginia Woolf's distinction in English literature derived from her critical writing as well as from her widely-read novels. She died in 1941

Haunted House consisted of 6 prose pieces, among the earliest she wrote in the style she afterward developed into the audacious and beautiful effects of To the Lighthouse and Mrs. Dalloway and originally published in Monday or Tuesday 20 years before, 6 others which appeared in various periodicals during her lifetime and 6 which were found among her papers after her death. These short pieces are miniature illustrations of Virginia Woolf's imaginative method and her power of penetrating to the depths of spiritual life below the surface appearances of society. Virginia Woolf's influence on the writing of a younger generation was considerable; but she was only one of many, most of them pulling in very different directions. For some young writers E. M. Forster was the master to be followed; for others Ernest Hemingway and the U.S. school of realists; others again found their chief inspiration in European authors. Nevertheless, in spite of the variety of methods and aims that grew from these various allegiances, it was possible to discern in the fiction of the period a spirit of the age in formulation, though in two rather distinct directions. The one direction was toward a special kind of comedy, which in nine cases out of ten had a bitter aftertaste, a sudden twist toward tragedy or a satiric condemnation so sharp that the smile died away on one's lips. Dialogue was the characteristic instrument by which these writers gave the narrative its pace and accent and developed character. The novels and stories of Christopher

Isherwood, with their setting in prewar Germany, in which a deep sadness could always be detected just below the laughter; the stories of V. S. Pritchett with their so frequent undertones of irony and tragedy and the satiric extravagances of Evelyn Waugh toward the end of which a grim-mouthed Savonarola seemed to emerge from behind the entertainer's mask-these were the prototypes from which the writers of a new generation that began to make its mark during the war learned their manner. No truly gifted writer can be confined within a class or a school, and Henry Green, with the rich poetic vein that added a fascinating complexity to his work, least of all; and yet the novels he wrote during the war, with their inimitably skilful use of dialogue, were clearly in this genre. If one compared these comedies and tragicomedies with the early novels of Aldous Huxley, the dazzling entertainments of a previous decade, one could see that the change was not merely in the tempo of the narrative and the use of dialogue, but also in the introduction of characters from new social levels. Some of Isherwood's most vividly created characters are from Berlin's working classes, Pritchett's from the shopkeeping lower middle classes; while in Henry Green's Loving the majority of the characters are domestic servants. Again, in nearly all his novels Graham Greene, essentially a tragic writer though also a master of narrative speed and quickfire dialogue, maintained a preference for the classless outcast on the seedy fringes of society as chief character.

The other trend was antirealistic, toward allegory and symbolism, and one may hazard the guess that the most powerful single influence in this trend was Franz Kafka, a Czechoslovak who wrote in German. In the works of Rex Warner, a contemporary and literary associate of Isherwood, Auden and Day Lewis, traces of the Kafka-esque imaginative approach abound; and yet such novels as The Wild Goose Chase and The Professor owed as much to John Bunyan and Daniel Defoe, perhaps also to Robert Louis Stevenson and Samuel Butler; and in the making of his most remarkable achievement, The Aerodrome, completed at the beginning of the war, the fantastic imaginative projections of H. G. Wells played their part. More deeply marked by Kafka's fantasy was the work of William Sansom, whose weird stories hovering between dream and reality showed an original intellect and undeniable imaginative force. The Aerodrome was a cautionary tale for the times: a warning that the individual human soul is more complex and more precious in its complexity than any Utopia ever planned for it, and that the most fanatical seekers after perfection are likely to end up as the most inhuman and reckless tyrants. This theme was implicit also in Graham Greene's masterpiece The Power and the Glory; indeed, it was a theme which, in one form or another, reappeared perhaps more frequently than any other in the work of the middle generation of writers in Britain in the latter part of the decade 1937-46.

Miscellaneous Writers.—An aspect of the decade not without its significance was the number of writers who achieved or maintained prominence without being easily classifiable as poets, novelists, essayists, critics or historians of their age. Outstanding among these men of varied gifts were Sir Osbert Sitwell, Sir Max Beerbohm, Siegfried Sassoon, Logan Pearsall Smith (who died in 1946), Harold Nicolson, Charles Morgan, Arthur Koestler, Herbert Read, William Plomer, A. L. Rowse and Ivor Brown. In addition to them, it was interesting to observe that the editors of the three literary periodicals which published a large

part of the vital work coming from the new talents were themselves authors in diverse ways. Cyril Connolly, editor of Horizon, a monthly which began its life early in the war, was not only a critic of original gifts and style but also translated several works from the French and wrote, under the pseudonym "Palinurus," a book of meditations and apophthegms which he described as a "word cycle" and gave the name of The Unquiet Grave; Peter Quennell, editor of the revived Cornhill, who had to his credit a distinguished book of poems, a novel and a volume of remarkable literary essays, continued during the years 1937-46 his polished studies in biography with Byron in Italy, Queen Caroline and Eighteenth Century Portraits; and John Lehmann, editor of New Writing, published a travel book about the Danube, a novel, a study of modern literature in Europe and two small collections of poems.

Osbert Sitwell was one of the most versatile writers of the period; and the list of his works included novels, volumes of poems, short stories, travel essays, plays and criticism. In all of them he had his distinct contribution to make, but in the judgment of his contemporaries it was not until he began his long autobiographical work, Left Hand Right Hand, that he found the ideal medium and at a time when he was at the height of his powers. The first volume was published in 1945, and the second, The Scarlet Tree, in 1946. Several other volumes were promised, and the work was likely to be the longest he ever attempted and at the same time one of the longest autobiographical achievements of the period. It could not, however, be considered merely as a story of its gifted author's life; it was also a brilliant re-creation of a vanished social world in the process of its dissolution, and a study of all the most notable artistic manifestations of Edwardian and Georgian England. The early chapters of the first volume were devoted to an exploration of the Sitwell ancestry, back as far as great-great-grandparents on both sides of the family: they were full of witty anecdote and neat period sketches, but the author's gifts did not reach their most satisfying scope until he and his brother Sacheverell and his sister Edith appear on the scene. Then, in his description of the ancient family home of Renishaw Hall and the effect on a child's imagination of its battlemented magnificence, its vast prospect of ornamental terraces and parkland; in his portrait of his father, eccentric, kindly, but ever increasingly absorbed in his favourite pastimes of landscape gardening and mediaeval research. in his humorous and affectionate description of the family servants; and in his account of Scarborough holidays and Scarborough society at a time when it was still a fashionable watering place that nevertheless retained a strong, unspoilt, native flavour; in all these things the author showed that he was a craftsman whose skill with words had steadily grown and whose qualities of mind had steadily matured. The Scarlet Tree developed the portrait of Sir George Sitwell, described the miseries of school life for a sensitive boy of artistic leanings and above all introduced Italy and made clear the tremendous effect that Mediterranean civilization and Mediterranean landscape was to have on his awakening sensibilities.

Arthur Koestler, although a Hungarian by birth, was one of the most original and stimulating writers in the English language who came into prominence during the decade. His gifts were not primarily creative, though it was chiefly by novels that he made his name, in particular with Darkness at Noon and Arrival and Departure, the first a story of the downfall and spiritual self-catechism of a commissar

in a country where revolutionary Marxianism had triumphed and the second of the hell on earth created by Hitler for the Jews who came within his grasp during World War II. Koestler's characters are apt to be more types and mouthpieces for his own views than living people, and the books derive their power from the passionate feeling underlying them and the intellectual subtlety with which the theme is developed. His book of essays and critical studies, The Yogi and the Commissar, therefore, provided the best key to his mind. It consists of essays collected from various periodicals, some on topical political questions, with a final section in which the author subjected the progress of socialism in Russia to a rigorous examination, testing the "myth," i.e., what enthusiasts outside Russia thought of it, against the "reality," i.e., the judgment to which an honest appraisal of statistics and political acts in the home and international fields should lead a dispassionate enquirer. The dominant theme, throughout this section as in the rest of the book, is that suggested by the title: that civilization showed an increasing split between two intellectual types, the "commissar" who believed that human society could be perfected and human life freed from all its ills by change from outside, by man's increasing control of his material environment, and the "yogi," who took the opposite view, believing that no good could come from wars or revolution or any ameliorative political action until man had suffered a change of heart, a change from within. Arthur Koestler's mind showed great analytical power and painful personal experience-he himself passed through a period of active revolutionary Marxianism which made him at the same time distrustful of all optimistic theories and programs and intensely alive to the human reality behind laboratory statistics. One might be uneasily aware that strong currents of emotion led Koestler again and again to overstate his case, but one could not fail to be disturbed and stimulated by his caustic wit and ruthless dialectic.

Historical and Literary Biography, Criticism and Scholarship.-Apart from those authors and works already mentioned, distinguished contributions were made in historical and literary biography by Winston Churchill with his Marlborough (finished in 1938), C. V. Wedgwood with William the Silent, Prof. J. E. Neale with Queen Elizabeth, Field-Marshal Lord Archibald Wavell with Allenby, Duff Cooper with David, Adm. W. M. James with his biography of Adm. Lord John Fisher, V. Sackville-West with her study of St. Theresa, The Eagle and the Dove, Aldous Huxley with Grey Eminence, Lord David Cecil with The Young Melbourne, Bishop David Matthews with Acton: The Formative Years, Prof. Reginald Coupland with East Africa and Its Invaders and Livingstone's Last Journey, Edmund Blunden with Shelley, Enid Starkie with Arthur Rimbaud, Hugh I'Anson Fausset with Walt Whitman, Joseph Hone with his Life of W. B. Yeats, Hesketh Pearson with his lives of Bernard Shaw, Conan Doyle and Oscar Wilde, Derrick Leon with his studies of Proust and Tolstoi, Derek Hudson with his biography of Thomas Barnes of the London Times and L. A. G. Strong with his study of the poet Thomas Moore, The Minstrel Boy.

Of more general historical studies, undoubtedly the most timely, brilliant and popular was G. M. Trevelyan's English Social History, but in the closely allied field of historical and political philosophy The New Leviathan by Prof. R. G. Collingwood (who died in 1943) was of major importance. Among other notable works mention must also be made of J. M. Thompson's The French Revolution, Prof. F. M. Stenton's Anglo-Saxon England, Prof. W. K. Hancock's Survey of British Commonwealth Affairs',

Prof. Basil William's Carteret and Newcastle, Dr. G. P. Gooch's Courts and Cabinets, J. A. Williamson's The Ocean in English History, Arthur Bryant's inspired studies of England during the Napoleonic struggles and his biography of Samuel Pepys at the admiralty and Rebecca West's study of Yugoslavia, more romantic but a unique intellectual and stylistic tour de force, Black Lamb and Grey Falcon.

Among other works of literary history and criticism, in which the period-in view of the great proportion of it occupied by the war-was particularly rich, outstanding were Lord David Cecil's Hardy the Novelist, Dr. C. M. Bowra's Heritage of Symbolism, William Gaunt's The Pre-Raphaelite Tragedy and The Aesthetic Adventure, Raymond Mortimer's Channel Packet, George Orwell's Critical Essays, A Critical History of English Poetry by Sir Herbert Grierson and J. C. Smith and the latter's admirable monograph on Wordsworth. Mention has already been made of the literary criticism of V. S. Pritchett, whose two collections of essays In My Good Books and The Living Novel deserved to be ranked with the best of the above. Books about Shakespeare were, as usual, legion, but outstanding were John Dover Wilson's The Fortunes of Falstaff, Prof. E. M. W. Tillyard's The Elizabethan World Picture and Shakespeare's History Plays, The Voyage to Illyria by Kenneth Muir and Sean O'Loughlin, John Palmer's Shakespeare's Comic Characters and a further volume in Dr. Harley Granville-Barker's Prefaces to Shakespeare, Othello.

Winston Churchill's biography of Marlborough was a massive and colourful tribute to a great ancestor by one of the few outstanding political figures of the day who had the true gifts of a writer and not merely the capacity to turn on words as one turns on a tap. It was scarcely finished when the author was called back to the world of affairs, and during the years between 1940 and 1945 all Churchill's skill with words and gifts of style went into the speeches with which he roused the British empire and the free world to destroy the tyranny which threatened them. These speeches, most of which were published by the end of 1946, were not only precious historical documents but also remarkable examples of oratorical literature that could challenge comparison with anything in British history. Much, of course, is lost when they are read in cold print, because the delivery was so unique and the personality of the speaker so powerful. Nevertheless, in reading one can still find many of the qualities that stirred and delighted the world audience that first heard them: the bluntness of utterance, the straightforward clarity of exposition, the avoidance of anything platitudinous or woolly in thought, the continual coining of witty and arresting phrases, the deliberate touch of archaism in the idiom and the careful logic in the building of a sentence or a paragraph; above all, the sound reasonableness.

The gulf which opened in the 19th century between what might be called the documentary and picturesque sides of historical writing was gradually bridged by a notable company of historians in the second quarter of the 20th century. Striking examples in the years 1937-46 were Prof. J. E. Neale's Queen Elizabeth, A. L. Rowse's Tudor Cornwall and Miss C. V. Wedgwood's William the Silent. The last-named work in particular gained the unstinted admiration not only of the learned who expect mastery of an ever-increasing mass of raw material, but also of the general public who look for imagination and human interest. One of the most talented of England's younger historians, the author already had an excellent biography of Oliver Cromwell and a detailed study of The Thirty Years' War to her credit. These works, and a number of

shorter essays included in a volume entitled *Velvet Studies*, showed that Miss Wedgwood had not only done thorough research in the history of the 16th and 17th centuries, but also had an artist's approach to her subject and an European outlook.

Far and away the most remarkable and popular historical work of the period was G. M. Trevelyan's English Social History, covering the period between Geoffrey Chaucer and the end of Queen Victoria's reign. The author explained in his introduction that it was only part of the book he had originally intended writing, but that as the war had to some extent interfered with his work, he had decided to publish it as far as he had written it. Trevelyan was always one of the most readable of historians, but English Social History surpassed all his earlier work in the richness of learning which went into its preparation and the art with which that learning was ordered. Every chapter was packed with detail about the way the British of the past had lived, what their houses were like, how they earned their daily bread, what they wore, what they drank, what their intellectual and artistic interests were, how they behaved to one another and to foreigners and what they believed about God. And all this was served up in a sequence of vivid concrete instances, through the medium of Trevelyan's polished but unaffected prose. It is particularly fascinating to watch the social panorama of one age dissolving into that of the next: an aspect of English history that had never before been realized in such clear detail or with so little prejudice.

A Critical History of English Poetry by Sir Herbert Grierson and Dr. J. C. Smith must be considered a remarkable achievement for the war years in which it was completed and published. It was a valuable reference book and a stimulus to further reading for anyone who had already made some explorations into the vast field of English poetry; the reader would not find any inspired vision of the meaning of that poetry's great fruitfulness and continuity or any deeper philosophical or social probing; he would, in fact, be well advised to look elsewhere for guidance in the complex poetical landscape of the 20th century; but he could not fail to rise from a reading of it mentally enriched by the immense learning, the balanced enthusiasm and wide sympathies of the two distinguished authors. Its particular excellences include a far fuller and juster appreciation of Scottish poetry than any comparable critical history; an admirable chapter on John Milton, another on John Donne that could scarcely be bettered and a series of chapters on the romantic poets, William Wordsworth, George Gordon, Lord Byron, William Blake, Percy Bysshe Shelley and John Keats which show an intimate * sympathy and a penetrating wisdom.

The field of literary research which produced the most interesting results during these years was perhaps that of Shakespeare's historical plays. One of the most significant achievements of Shakespearean scholarship since 1900 had been the rehabilitation of Shakespeare as a highly educated man, who in intellestual matters could hold his own in the most brilliant circles of Elizabethan England. In Shakespeare's History Plays Dr. E. M. W. Tillyard carried this process of rehabilitation, which owed so much to the pioneer labours of J. S. Smart and John Dover Wilson, an impressive stage further. It should be considered in connection with Dr. Tillyard's earlier book, The Elizabethan World Picture and Dover Wilson's The Fortunes of Falstaff. In the former book Dr. Tillyard, following a line parallel to that of some distinguished U.S. scholars,

had suggested that the mediaeval idea of the cosmic order, in which man had a central place, bound by the most complex affinities and correspondences to the heavenly beings above him and the beasts and vegetables below him, persisted in the thinking of the Elizabethans to a degree to which earlier criticism had been all too blind. Dover Wilson, in his brilliant and controversial The Fortunes of Falstaff, showed how perverted the popular idea of Prince Hal, afterward Henry V, had become because the mediaeval background, the belief in rank and order and the beauty of strong central authority which Shakespeare shared with his contemporaries, had been forgotten. In Shakespeare's History Plays, Dr. Tillyard argued with considerable force that the particular Elizabethan expression of this conception, the legend of the Tudors as the heavenblessed restorers of peace and order in England after the disasters which followed the violation of the sanctity of kings by Bolingbroke's murder of Richard II, was the inspiration of Shakespeare's long sequence of historical plays; and that the three parts of Henry VI were all from Shakespeare's hand and fitted into their author's elaborate and daring intellectual scheme, though of earlier composition than the Falstaff plays which they follow historically.

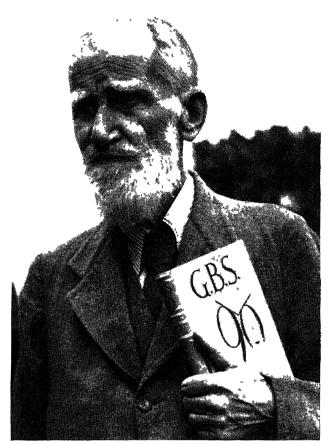

Reporters and Witnesses.-The years between 1937 and 1946 were the years of supremacy, in public interest, of the reporter, the journalist following the armies and investigating the secrets behind their movements and the young man with no assignment to any paper, news agency or broadcasting outfit who was anxious to record his experiences in the thick of the violent happenings of his time and communicate them to those who stood on the circumference. In this way books, stories and articles in hundreds and thousands came out of the Spanish Civil War, the Chinese war and World War II and its origins; and some of them had a claim to rank as literature. Because they were not strictly speaking novels, short stories or history, they must be the subject of separate consideration here. It is at the same time important to point out that it was extremely unlikely that all the significant work falling under this head had been written by the end of 1946.

Outstanding among the books about the Spanish Civil War were G. L. Steer's The Tree of Gernika, Arthur Koestler's Spanish Testament, George Orwell's Homage to Catalonia, T. C. Worsley's Behind the Battle, Tom Wintringham's English Captain and John Sommerfield's Volunteer in Spain; about the civil war in China one book was of special interest, for it was written by a well-known poet and a well-known young novelist in collaboration: Journey to a War by W. H. Auden and Christopher Isherwood. World War II produced, inevitably, a great many more. First place should perhaps go to The Last Enemy by Richard Hillary, because the author, a young pilot who was badly burnt in action and finally killed in an accident, attempted not so much to describe his outward experiences as to record his inner psychological development under the impact of war and to estimate the significance of the necessity of battle for his whole generation. Not all his contemporaries agreed with his viewpoint or his conclusions, but very few, except among the poets, came anywhere near his depth of reflection. Of the more purely descriptive individual books, the anonymous Fighter Pılot, one of the first, remained one of the best. Many others were both moving and effective in writing, with J. Mallalieu's Very Ordinary Seaman, Captain Anthony Irwin's Infantry Officer, Wing Commander R. D. M. Gibbs's Not Peace but a Sword, Brian Stone's Prisoner from Alamein,

F. Majdalany's The Monastery and Guy Pearce Jones's Two Survived among the more notable successes. In the ranks of the reporters proper, Alan Moorehead's African trilogy, Mediterranean Front, A Year of Battle and The End in Africa, acquired a unique place for their descriptive power, their range of sympathy and sober intelligence of judgment; very close to them in interest came Alexander Clifford's Crusader and two books which show a sensitiveness to human values and an appreciation of atmosphere quite out of the ordinary: We Landed at Dawn and Birth of an Army by A. B. Austin, who was killed during the fighting in Italy.

The war correspondents during World War II had a unique opportunity of writing history as it was being created; but as the war went on it became more and more evident that an extraordinarily rare combination of qualities was required for success. Those who had the artistic gifts too often lacked the opportunities, and those, like the war correspondents who had all the opportunities of observing and participating in the drama at every level, too often lacked the discrimination, the judgment, the sense of human perspective and the feeling for words that could have turned their dispatches into literature. Above all they lacked a controlling emotion about the event witnessed, the only quality that could have given them spiritual depth and therefore significance beyond the interest of the moment. Among the few with a claim to success as artists, Alan Moorehead, Alexander Clifford and A. B. Austin ranked high, precisely because they possessed this quality. In Crusader (afterward rewritten as Three against Rommel) Clifford's eye was on the war itself and not the surface froth of it; the narrative has a continuous sobriety and awareness, and one is given not only a sense of the whole scene, which no ordinary soldier within his confined sphere of action could have had, but also a vivid close-up of selected details which give the scene life, and, beneath the outward drama, glimpses every now and then of what it meant to be human beings inside the armour plating and behind the barbed wire. The same human respect is the outstanding quality of A. B. Austin's two books; his senses as well as his mind were continually alert, and his observation of small natural details and casual but characteristic remarks of the soldiers were extremely telling. More than any other correspondent he gave the impression of intimacy, of being one of the men whose exploits he described rather than apart from them, although he did not lose sight of the wider picture and the lesson of each experience in relation to the conduct of the war. Like Austin, Moorehead gave a memorable account of the fighting on Longstop Hill; his battle pictures, particularly of tank battles with their extraordinary confusion, violence and monstrosity, are all fine pieces of work, but the greatness of his achievement in his trilogy on the war in Africa-an achievement he did not quite equal in his reporting of the last phase in Europe-lay in his capacity to set these vivid close-ups in perspective in the general picture, so that they give clear and living portraits of generals and intelligible descriptions of headquarters' planning beside the battle scenes and details that skilfully sketch in the mood and behaviour of ordinary soldiers, sailors and airmen and the atmosphere of the landscape. He was also extremely fair and commendably free from the fault that marred so many otherwise gifted correspondents' work, that of excessive partisanship for the particular group or army to which he happened to be accredited.

The period was not particularly rich in good books of travel, chiefly because world events severely restricted the opportunities of free and unofficial travel. Mention should,

George Bernard Shaw celebrated his 90th birthday on July 26, 1946. He is shown holding an anniversary book about himself edited by his neighbour at Hertfordshire, Eng.

however, be made of F. D. Ommaney's South Latitude and North Cape, Freya Stark's impressive books on Arabia, The Gobi Desert by Muriel Cable and F. French, Sacheverell Sitwell's Roumanian Journey, Peter Fleming's News from Tartary and Rose Macaulay's delightful compilation of the works of earlier travellers in They Went to Portugal.

Drama.-The English dramatists of the period belong properly to another article in this compilation (see THE-ATRE); but they had their more purely literary value as well as their stage appeal and success, and from this point of view the present article can not be brought to a conclusion without mention of George Bernard Shaw's Geneva and In Good King Charles' Golden Days; J. B. Priestley's Time and the Conways, Music at Night, Johnson over Jordan, They Came to a City, Desert Highway and other plays; of Rodney Auckland's The Dark River and Sean O'Casey's The Star Turns Red, Purple Dust and Red Roses for Me. O'Casey was a natural poet, although he did not use verse in his plays, and no contemporary dramatist could rank with him for the rhapsodic, imagestudded beauty of his supreme passages. During the decade 1937-46, he also wrote two volumes of autobiography, I Knock at the Door and Pictures in the Hallway, in which he displayed the same gifts for picturesque and spirited writing in a slightly lower key, the same typically Irish mixture of humour and romantic colour. The poetic drama of W. H. Auden and Christopher Isherwood, of T. S. Eliot, Stephen Spender and Norman Nicholson have already been mentioned in the discussion of their poetry. The plays of Noel Coward, Terence Rattigan, Emlyn Williams and James Bridie, four leading playwrights of the

period, seemed to belong essentially to the stage and to have only a diminished life in the library.

Achievement.—Any assessment of the creative endeavour of the period as a whole, could not fail to note the multiplicity of talent, and at the same time the rarity of occasions on which a gifted writer of promise developed into a really commanding figure in literature. Looking at it from what was perhaps too close a viewpoint for an altogether satisfactory judgment, critics were inclined to believe that it might be chiefly remembered in time to come by anthologies-of poems, stories, critical essays and other selected prose passages. The fragmentation of consciousness caused by the excessive pace, danger and complexity of life in an age of scientific hypertrophy was the young writer's chief enemy; brave was the spirit and ruthless the will that could triumph in devotion to an artistic calling under such circumstances. Leisure, moreover, was hard to find even if the will were there, and the problem of patronage was more acute than for generations. And yet it was perhaps only in this period that the vacuum created by the enormous casualty lists of World War I was fully felt, the death of a few distinguished elder figures impoverishing literature quite disproportionately; and, with the exception of two or three years at the end of the period when the exhaustion of six years' war strain and war work was telling at last, the general impression was one of vitality and of a continuing balance between tradition and experiment that few if any other countries could show. Entomology

The ten-year period from the beginning of 1937 to the end of 1946 may truly be termed the "Golden Age of Entomology." During this space of time more progress had been made in this science than in any like period in its history. In fact, it may rightfully be said that in certain fields, especially in medical entomology, economic or agricultural entomology and certain phases of systematic entomology, notably the studies of mosquitoes and flies affecting human health, more had been accomplished during these ten eventful years than during all the preceding years. Many factors intimately connected with the prosecution of World War II were directly responsible for the tremendous strides in entomology during this time. It was the first great war fought under tropical and subtropical conditions which necessitated the control of malaria, yellow fever, typhus, pappataci fever, kala-azar, dengue fever, plague, trypanosomiasis, filariasis and other insect-borne diseases which were often more destructive to human life than the instruments of war. The magnitude of operations were so extensive as to affect every commodity in the economic system. Many of the most important insecticides were either wholly restricted or greatly limited, and new ones were hastily rushed into their places. Some of these,

especially DDT, proved to be phenomenal in the scope of usefulness and became very important factors in the control of many kinds of insects and in the winning of the war. The production and conservation of food gave great impetus to insect control. The ravages of insects in victory gardens gave many lay and professional men and women their first insight into the necessity of insect suppression and the uses of insecticides. The values of insect eradication, quarantine and the many intricate problems dealing with insects became very apparent to all and created, for the first time in history, a public interest and concern, and support in relation to the whole field of entomology. Thus, in ten years, this relatively young science rubbed shoulders with chemistry, physics, medicine and other well-recognized traditional sciences.

Prior to the Outbreak of World War II.—During times of peace entomologists are concerned chiefly with teaching and research work having to do with the general routine of economic entomology, medical entomology, horticultural quarantine and investigations in history and systematics. The enormous losses inflicted on man's food supply during normal conditions amounted in the late 1930s to several billion dollars annually in the U.S. alone, and a staff of research and field men was employed to cope with the unpredictable situations as they arose.

In 1937 E. P. Johnson, Ithaca, N.Y., showed that the chicken mite, Dermanyssus gallinae, could transmit the causal agent of leucosis in fowls from infected to healthy birds. The scientific name of the common North American chigger, according to A. C. Oudemans, became Trombicula alfreddugesi, of which Trombicula cinnabaris and Leptus similis are synonyms. The mite, Tarsonemus bancrofti, was observed as a pest of sugar cane in Louisiana; it was first noted in the United States in Florida in 1935. Australian and New Zealand tomato mite was described as Phyllocoptes lycopersici by A. M. Massee. It was first noted as a pest of greenhouse tomatoes in New Zealand in 1936 and was later suspected to be identical with the species subsequently found in California in 1940. The destructive citrus bud mite, first noted in southern California in June, was described as Errophyes sheldoni by H. E. Ewing in Nov. 1937. The first complete investigations of the life history and effective control of the mealy plum aphid, Hyalopterus arunidinis (H. pruni) were made and published in California by L. M. Smith.

The golden buprestid, Buprestis aurulenta, was caught near Auckland, N.Z., in 1937; it may possibly have emerged from timber shipped from the United States, especially from the Pacific coast, where the beetle is common but of no great economic importance. Shipments up to 8,127 larvae of the predatory elaterid beetle, Pyrophorus luminosus, were sent from Puerto Rico via the United States and England for colonization and to prey upon the larvae of Lachnosterna smithi, a serious pest of sugar cane in Mauritius. In France a control campaign on the Colorado potato beetle, Leptinotarsa 10-lineata, was renewed in five new departments in 1937; no control measures were necessary in that year because of unfavourable weather conditions. Extensive flights were noted in July and August, and quantities of adult beetles were washed up along the Morbihan coast.

Legislation was enacted in a number of European countries during 1937 in an attempt to prevent the spread of the Colorado potato beetle from France into the British Isles, Germany, Belgium, the Netherlands and Luxembourg. The beetle was reported in 22 communes in Bel-

gium in 1937; the previous year it occurred in 116 foci in 45 communes. It was first taken in the Netherlands in 1939 and more than 200 small infestations of it were discovered in Switzerland.

The cowpea weevil, Bruchus analis, was first discovered in South Africa by M. J. Costhurzen and F. X. Laubscher in 1937; it was confused with B. marshalli and B. chinensis. The May beetles, Melolontha spp., were very injurious to forest trees in Germany; the only method of control was by hand-picking the larvae and adults. Fuller's rose weevil, Asynonychus godmani, was first found in New Zealand. The clover seed weevil, Tychius picirostris, was first reported in North America in Vernon, B.C., in June 1937 on alfalfa (lucerne) and red clover. It had, however, been found in British Columbia between 1924 and 1930, and in 1933.

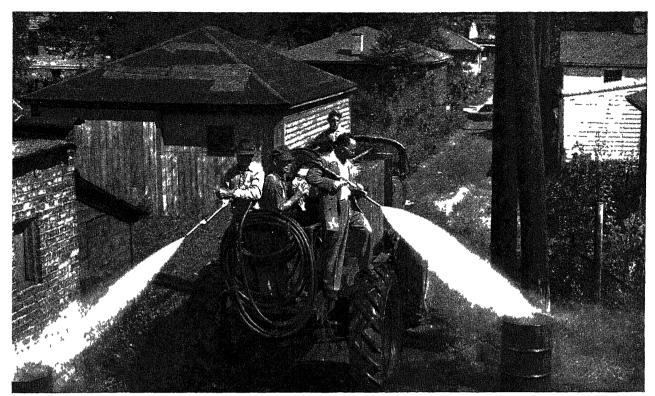

A new and serious potato weevil, Epicaerus cognatus, appeared in Mexico—intercepted at New Orleans, La., in 1922. The larvae burrow throughout the tubers and penetrate as deep as eight inches to pupate in the ground. Adults feed exclusively on potato foliage, Otiorhynchinae.

Eradication of sweet potato weevil, Cylae formicarius, was begun in the southern states during 1937 by the United States department of agriculture, bureau of entomology and plant quarantine in Alabama, Georgia, Louisiana, Mississippi and Texas. In a survey of 172 counties, 2,555 infested properties were discovered in 33 counties. Eradication included the destruction of infested seedbeds, self-sown sweet potato plants on infested properties and adjoining areas and to wild food plants, as well as the cleaning of infested fields and stores.

The European corn borer, Pyrausta nubilalis, ranged from Guam and the Philippines to Japan, through all of Asia, central and southern Europe and northern Africa to North America, attacking corn (maize), millet, sorghum, hemp, hops and other plants. It was active during 1937 in Japan and China and persistently extended its territory and injuries in the United States and Canada. The oriental fruit moth, Laspeyresia molesta, extended its distribution from northern Italy into the Ticino, Switzerland, and also near Lausanne, Switzerland. Forty species of mosquitoes were known to occur in Germany up to the year 1937. Outbreak of plague occurred in Mwanza, Tanganyika territory, between Feb. and June 1937; it was believed that the outbreak was started by infected fleas carried in hides received from an endemic rural area.

The flies of the family Tyrpetidae, known as fruit flies, are cosmopolitan and were among the worst pests of fruits in many countries. The Mediterranean fruit fly, Ceratitis capitata, was present on every continent except North America although it occurred in nearby Bermuda. It caused serious injury in various parts of its range to a wide variety of fruits, especially citrus fruits, peaches, guavas, apricots, grapes and figs. The olive fly, Dacus oleae, is also a very injurious species. In Italy, Spain and France it caused great losses to the olive industry. These fruit flies were effectively quarantined by the United States after the passage of the national Fruit and Vegetable Quarantine No. 56, Nov. 1, 1923.

In the United States the apple maggot, Rhagoletis pomonella, and the cherry maggots, R. cingulata and R. fausta, were the important members of the fruit fly group during 1937. The Mexican fruit fly, Anastrepha ludens, attacking grapefruit, guavas, sapotes, oranges and other fruits in Mexico, Nicaragua and northern South America, first entered the lower Rio Grande valley in the United States in 1927 and again in 1929. According to G. W. Herrick, a veritable epidemic of the common dog flea occurred in the

Preventive measures against infantile paralysis were taken at Lyons, Ill., during the summer of 1946, when miles of alleys were sprayed with DDT to kill flies and mosquitoes suspected of carrying the deadly germ

eastern United States during 1937; this flea may infect children with an intestinal tapeworm.

The spruce sawfly (Diprion polytomus) outbreak in Canada in 1936 continued in east Canada and northeast United States on the white spruce, black spruce and balsam fir, and the damage increased. On the Gaspé peninsula half of the mature white fir, representing 10,000,000 cords or 47,500,000 cu.ft. or one-fifth of the total stands of spruce and balsam fir, was killed. The spread of the insect in North America covered 25,000 sq.mi. in the United States and 115,000 sq.mi. in Canada during 1937.

Metaphycus helvolus, the most important parasite of the black scale, Saissetia oleae, was introduced into California from South Africa by Harold Compere and H. S. Smith. Successful experiments with dichloroethyl ether in the control of sod worms, Crambus spp., were conducted in southern California by M. W. Stone and J. C. Elmore. Increasing use of cryolite as a dust and spray for the control of the codling moth and many other agricultural pests occurred during 1937. D. B. Mackie and W. B. Carter tested methyl bromide as a fumigant; preliminary experiments showed it to be promising in the control of insects on and in plant materials such as the potato tuber moth and on tomato pinworm, granary and rice weevil, confused flour beetle and others.

The value of coal tar oil for the destruction of aphid eggs was demonstrated by the investigations of H. N. Worthly and H. M. Steiner of Pennsylvania. Tartar emetic and sugar were successfully used as a spray to control citrus thrips, *Scirtothrips citri*, on lemons in southern California by A. M. Boyce and C. O. Persing.

In 1938 A. D. Imms of England wrote a book of more than 400 pages in which he gave a summary of advances in entomology to that time. The most impressive phase in which advance in knowledge of the science of entomology had been made was in insect palaeontology. Imms pointed

out that the fossils found in the rocks of the Permian and Triassic beds had revealed a remarkable insect fauna. The strata of rocks from which specimens revealing this new knowledge had been taken were located in Queensland and New South Wales, Australia, in northern U.S.S.R. and in Kansas in the United States. The rocks in Kansas furnished, perhaps, the most perfect fossil insects, which contributed largely to the advance in knowledge of the evolution and development of the orders of the Insecta.

Investigations had shown that insects are endowed with those remarkable gland secretions known as hormones. Notable additions to the knowledge of these active agents in insects were made. A series of experiments seemed to prove the presence of a hormone in the body of the vinegar fly, Drosophila melanogaster, with the power of changing the colour of the insect's eyes. The investigators demonstrated that tiny injections of a clear, yellow fluid, derived by treatment of finely ground pupae of the wild type of fly, into certain colour-type larvae produced adult flies with eyes modified from nearly colourless and pale pink toward brown. The hormone appeared to be very active since the authors estimated that 1 gm. could change the eye colour of 4,200,000 flies.

The European earwig, Forficula auricularia, was discovered in the province of Ontario, Canada, in 1938, and in three succeeding years 38 other infestations were found.

In the United States the year 1938 was noteworthy for severe injury by locusts and grasshoppers. Nearly all of the states between the Mississippi river and the Pacific ocean, together with Wisconsin and upper Michigan, were visited with light to severe infestations of these destructive insects. The most serious and widespread destruction occurred to small grains in parts of North Dakota and South Dakota, and to forage crops and range grasses in other states. The extensive flights of the lesser migratory locust, Melanoplus mexicanus atlanis, from its original breeding grounds, especially into eastern Montana, were noteworthy among the erratic activities of this species. In the corngrowing regions with their greater diversity of crops, the

differential grasshopper, M. differentialis, the two-striped locust, M. bivittatus, and the red-legged locust, M. femur-rubrum, were present and seriously injurious, while the long-winged locust, Dissosteira longipennis, caused severe injury in portions of Colorado, New Mexico and Texas. The provinces of Manitoba, Saskatchewan and, to a lesser extent, Alberta, Canada, also suffered extensively from incursions of these insects.

The potato tuber moth, Gnorimosohema operculella, was first discovered in the U.S.S.R. near the town of Patti on the Black sea in 1938. The larvae were mining leaves of tobacco, potato, tomato, eggplant and Datura stramonium.

A list of insects captured during routine quarantine inspections on seaplanes arriving at Miami, Fla., from Mexico, Central and South America in 1938 showed that of 398 aircraft examined, 187 harboured insects, and 166 of the 651 insects found were alive. Forty mosquitoes representing six species were taken. Each aeroplane was properly treated to kill all the insect immigrants.

In the Tennessee valley 35 species of mosquitoes were reported by S. E. Shields, including 5 species of Anopheles.

Tsetse flies, Glossina palpalis, Glossina morsitans, et al., are inhabitants of tropical and subtropical Africa, and are the vectors of the causative organisms (trypanosomes) of the two types of sleeping sickness of man, and of the disease of cattle known as nagana. The tsetse fly situation had been recognized as one of the chief biological problems of British Africa. Moreover, the problem had assumed a new and unexpected significance during the late 1930s in view of the suggested colonization of Tanganyika with European refugees, for two-thirds of the total area of that colony was infested with the flies. The British Colonial Advisory committee, however, according to the London Times, had already recognized the seriousness of the problem and had, earlier in 1938, recommended a grant of £207,974 to be used by the Tsetse Research department in Tanganyika, for an extended investigation of the flies. The problem was exceedingly complex and far-reaching, because of the intimate association of the biology and habits of the flies with the wild animals, the various types of vegetation, the streams and the forest areas of the region.

The third conference of the International Committee of the Colorado Potato Beetle was held in Zurich, Switzerland, March 3–5, 1938. The seventh International Congress of Entomology at Berlin, Germany, was held August 15–20, 1938. There were 351 delegates from all parts of the world. More than 1,000 entomologists registered and were in attendance. The International Locust conference was held at Brussels, Belgium, in Aug. 1938. The international implications of locust invasions were becoming more important yearly, and united action of many nations was urged to prevent the frequent devastations of large areas by locusts which breed in one country and migrate to and injure another.

During 1939 a severe outbreak of green bug, Toxoptera graminum, in Oklahoma caused an estimated loss of 100,000 acres of small grains, according to F. A. Fenton and H. H. Fisher.

The Colorado potato beetle, Leptinotarsa ro-lineata, was the subject of a good deal of attention in Europe during 1939, especially in Germany. Potatoes constituted an important food crop of peoples in northern Europe, a crop easily grown, harvested and stored; and anything tending seriously to lower its production became a source of considerable anxiety. Special effort was, therefore, made in

Germany during 1939, as World War II approached, to control the ravages of this pest. In Spain the beetle caused trouble from a phase of its presence in that country entirely apart from its direct injury to the potato plant. Northern Spain produced potatoes as an export crop to the British Isles. During the civil war of 1936-39 the beetle entered Spain, probably from France, and the growers found themselves greatly handicapped by a quarantine against their crop because of the danger of introducing the beetle with the export shipments of potatoes, although the beetle had been previously found in England. Early in 1939 while Poland still existed as a nation, an inquiry was made by an official of the Polish department of agriculture regarding the severity of the injuries caused by the beetle in the United States and the effectiveness of the spray program in holding the insect in check. The official stated that he had lately been in the Netherlands and Belgium meeting with a committee for the study and control of the Colorado potato beetle. It was evident that the presence of this insect in Europe was looked upon as a most serious problem. First records of the invasion of the Colorado potato beetle into western Germany were made April 7, 10 and 23, 1939.

The Rockefeller foundation, in charge of the yellow fever control and extermination program in Brazil, relinquished the entire work on yellow fever to the Brazilian national fever service, ministry of education and health, in 1939.

The effects of the accidental introduction of the African mosquito, Anopheles gambiae, into Brazil in 1930 was being felt very forcibly by the severity of malaria epidemics following in the distributional wake of the mosquito. It was thought that the mosquito would not find conditions in the region of Natal, Brazil, suitable to its development, and that it might be easily exterminated. On the contrary, an outbreak of malaria due to the activities of the mosquito, of a severity unknown previously to the city, took place during 1930 and 1931; and by 1931 the mosquito had spread northward along the coast for a distance of 115 miles. By 1938 it had gone more than 200 miles north and west of Natal nearly to the source of the Jaguaribe river. The virulent type of malaria which it carried to this extended territory developed an epidemic which afflicted nearly 60,000 people in a population of about 70,000, of whom more than 5,000 succumbed to the ravages of the disease. The mosquito did not seem to have met any adverse conditions in Brazil that tended to check its spread.

Anopheles gambiae is a domestic mosquito which haunts the dwellings of man. It passes through its life cycle in seven or eight days, which enables it to increase rapidly and in great numbers. All of the evidence indicates that it was the most dangerous vector of malaria in the western hemisphere. H. E. Fosdick of the Rockefeller foundation pointed out in 1938 that unless some method of checking its spread were devised, it would eventually reach the southern United States in the north and Argentina in the south, thus creating a public health problem outranking all others in tropical America.

Harold Compere, entomological explorer for the University of California, recorded and described 28 species of primary parasites of the black scale, Saissetia olea, which he collected in Africa and shipped to California in 1936–37 for propagation and trial.

A strenuous attempt was being made in the entomological control of the cactus or prickly pear, Opuntia megacantha, which densely covers more than 2,000,000 acres in the Union of South Africa, by the introduction and distribution of the cactus moth, Cactoblastis cactorum, a

native of Argentina. During 1938, 12,000,000 eggs of the moth were distributed throughout the infested districts. Extensive destruction of the prickly pear plants by the caterpillars was encouraging.

A new weevil, *Hypera brunneipennis*, was discovered in alfalfa fields of the Yuma, Ariz., area in 1939; it was first believed to be the alfalfa weevil, *Hypera variabulis*.

The Argentine ant, Iridomyrmex humilis, was first found in Melbourne, Australia, in Sept. 1939; although this was the first positive record it is thought to have been there for several years previous. To combat the noxious St. John's wort, Hypericum perforatum, in Australia a number of beetles feeding on this plant were introduced into that country from Europe: Chrysomela hyperici in 1934; C. gemellata and Actinotia hyperici in 1939.

Extensive collections of insects in the air at altitudes up to 15,000 ft. by aeroplanes showed that many species, including both winged and wingless individuals, occurred as high as 14,000 ft. Twice as many insects were taken at 1,000 ft. as at 2,000 ft. More were collected in May than in any other month. Temperature was the most important factor governing the number of insects in the air at any given time. A surface temperature of 75° to 79° F. appeared to be the most favourable. The velocity of wind currents influenced greatly the distribution of insects through the air. When the velocity at the surface was 5 to 6 mi. per hour the largest number of insects at the lower altitudes was taken. In explaining the presence of the wingless specimens taken at altitudes above 5,000 ft., P. A. Glick said it was likely that these forms were transported in upper air currents, possibly for several hundred miles.

Developments in 1940 and 1941.—The tomato russet mite, *Phyllocoptes destructor*, was discovered on greenhouse tomato plants by S. F. Bailey in California in 1940—the first record of this mite in North America. The tarsonemid mite, *Hemitarsonemus latus*, a plant pest of economic importance, was first noted in Durban, Natal, Union of South Africa, by M. M. J. Lavoipierre.

W. M. Stanley was first in North America to photograph by X-ray the discrete particles of the tobacco virus, a single particle of which measured 15 millimicrons in cross-section and about 330 millimicrons in length.

Tartar emetic, SbOKC₁H₁O₆, had been found effective in the control of certain thrips, including the injurious citrus thrips, Scirtothrips citri, of middle and southern California and the gladiolus thrips, Taeniothrips gladioli, of widely separated areas in the United States and Canada. The material was applied as a spray and had little or no serious effects upon the plants treated. The dinitrophenol and cresol compounds, experimented with as ovicides for aphids, had given seemingly good results and were being extensively used in various parts of North America in the destruction of eggs of Hyalopterus arundinis, Aphis pomi, and Aphis rosea on dormant deciduous fruit and ornamental trees. These chemicals replaced to some extent the coal tar sprays because they are less toxic and injurious to the operators of spray equipment.

Methyl bromide fumigation had been greatly extended during the late 1930s and by 1940-41 had reached vast proportions in connection with the fumigation of fruits and plant materials shipped in carload lots. In the handling of plant materials originating in the areas infested by the Japanese beetle and the white-fringed weevil some 4,000 cars were treated during 1938-39. This material was also extensively used for fumigating granaries, mills and warehouses for insects infesting stored products and was also being tested for oil-infesting species. Methyl bromide as a fumigant had been used for treating infested fruits

and vegetables like the larvae of codling moth in apples and pears and the potato tuber moth in potatoes.

The Swiss firm of J. R. Geigy, A.G. discovered the insecticidal properties of DDT and was granted a patent on March 7, 1940, by the Swiss government.

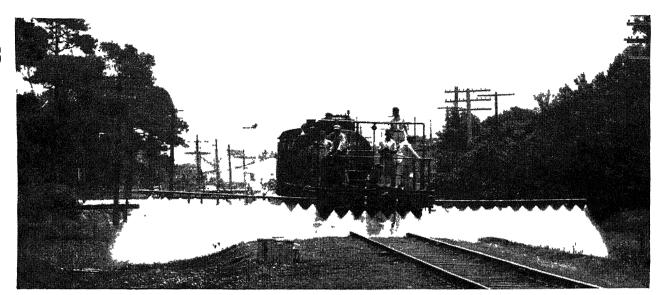

Plant virus diseases transmitted by insects received a great deal of attention from botanists, plant pathologists, entomologists, physiologists and physical chemists in the early 1940s. Great strides had been made as a result of their studies, research and publication, as well as by those made in the medical and veterinary fields of viruses affecting humans and other animals. By means of very careful and exacting technique plant viruses (first discovered in 1892) had been examined most critically, and a number of distinct strains were recognized for many of them. For instance, there were, in 1940, four distinct strawberry viruses indicated as Fragaria virus 1 to 4. While plant viruses are transmitted by many insects, the most important vectors are aphids and leafhoppers. The green peach aphid, Myzus persicae, appeared to be involved more than any other single insect.

During the years preceding World War II there had been ever-increasing demands in the United States for insects as food for birds, fishes and other animals. These demands created a market which had been largely met by foreign countries; thus the German occupation of large sections of Europe shut off some main sources of supply. The meal worm, Tenebrio molitor, and other species sold in living condition constituted one of the most important foods for small domestic animals. While they had been raised extensively in relatively small lots in the United States, they had been largely imported from the Netherlands, where they were reared in great quantities, but never sufficient to supply all of the market demands. Larvae of the broad-horned flour beetle, Gnathocerus cornutus, were also reared commercially to feed young birds in Europe.

Ant eggs are in reality the pupae of the common red wood ant, Formica rufa, which builds large mounds or nests in the forested areas of Europe and North America. These nests are often very large and may contain as many as 100,000 individuals. By controlled robbing, the nests may be kept at a relatively high productivity. The world supply prior to World War II was produced chiefly in Finland, which controlled the market. These dried ant pupae were generally used in feeding young birds and other animals.

Mexican dried flies or water boatmen (Corixidae) include fresh-water insects, particularly the water boatman most often adulterated with fairy shrimps (Anostraca?) and backswimmers (Notonectidae). From 25 to 50 tons were imported annually into the United States during the late 1930s and early 1940s from Mexico and parts of Central America.

The development of biological control methods for the subjugation of insect and plant pests had continued with considerable headway during the years 1920–40 and by the latter year had reached a peak of great importance in the world of economic entomology. This method was extensively employed in connection with many important insect and weed problems such as the gypsy and brown-tail moths, the Japanese beetle, the sugar-cane borer, the oriental peach moth, the woolly apple aphid, the European earwig, the European elm leaf beetle and the European spruce sawfly in North America; sugar cane and fruit insects in Hawaii; fruit flies, woolly apple aphid, St. John's

Sprayer attached to railroad car being operated for white-fringed beetle control

wort and prickly pear in Australia; prickly pear and many orchard insects in South Africa; and like problems in other geographical areas. Special emphasis was placed upon the use of *Trichogramma evanescens* as an egg parasite of many destructive moths and particularly of the sugar-cane borer and cereal-infesting insects.

The establishment of the Juan Mina Entomological station of the Gorgas Memorial laboratory in the Panama Canal Zone extended the arm of research deeper into the problems of tropical medicine.

The grape leaf skeletonizer, Harrisiana brillians, was first discovered infesting grapevines in California in San Diego county during 1941; the insect was later regarded as a potential danger to the great grape industry of the state.

For many years agriculturists and entomologists had been selecting and breeding plants showing resistance to the attacks of various insects. C. M. Packard in 1941 showed that Hessian-fly-resistant wheats had been observed in the United States after 1781, and that thousands of varieties of wheat had been tested and promising selections made from such well-known varieties as Dawson, Karovale, Marquillo and countless other breeding strains. It is worthy of note that Hessian-fly resistance is transferable according to the laws of genetics from spring to winter wheat and vice versa without obtaining objectionable features and that resistance to the fly may be successfully combined with resistance to fungus diseases in a single homozygous line. Wheat varieties were also known that are resistant to the chinch bug, the wheat stem maggots, fruit fly and joint worms. Selections of alfalfa were reported to be resistant to the potato leafhopper and to the pea aphid.

Attempts to find substitutes for the heavy metal insecticides in codling moth control resulted in a vast amount of investigational work. Organic substitutes which had given some promise were extracts of nicotine, pyrethrum, phenothiazin and xanthane, and combinations of these extracts with petroleum and fish oils, bentonite and other materials. The pyrethrum and phenothiazine extracts did not prove as satisfactory as other extracts in 1941.

That the fowl malaria organism, Plasmodium gallinaceum, might be transmitted by the European mosquito, Culex quinquefasciatus, was demonstrated in 1941 by experiments of L. Vargas and Enrique Beltrain, who dissected sporozoites of the parasite from the salivary glands of this mosquito reared in the laboratory.

The problem of the sheep tick, Ixodes ricinus, causing

losses up to 50% in sheep not acclimatized to the diseases known as louping-ill and tick-borne fever, was also attacked in 1941. The tick is able to survive on a variety of hosts in the absence of sheep and is well-adapted to the moorland and hill regions where it is active in spring and early summer and again in the fall. Derris dusts afford protection for a period of two weeks for lambs, and a dip composed of either a 0.2% arsenious oxide or 0.02% derris resin is effective on adult sheep for a period of 10-14 days.

Two new species of spore-forming bacteria causing milky diseases of Japanese beetle larvae were described in 1941 as Bacillus popilliae sp. n. and B. lentimorbus sp. n. by S. R. Dutky. The spores occur mainly in the blood of the grubs reaching from 20,000,000,000 for the former and 10,000 for the latter in a single larva. Ethyl bromide was used in fumigating 4,000 cars of plant materials in carload lots originating in the areas infested by the Japanese beetle and the white-fringed weevil.

Basic copper arsenate of lead appeared as one of the newer stomach poisons. It proved more toxic than calcium arsenate of lead to the most important insects.

Effect of U.S. Entry into World War II.—The attack on Pearl Harbor greatly increased the difficulties and responsibilities of U.S. entomologists. More effective control measures were needed, fewer insecticides were available and less manpower could be used. It was obviously important to produce as much food as possible, and every effort was made to prevent and reduce losses due to insect infestations of the growing crops. Special programs were inaugurated to deal with such injurious insects as grasshoppers and locusts, cutworms and army worms, chinch bugs, Hessian flies, potato beetles, codling moths, cotton boll weevils and a host of other insects that yearly destroyed 5% to 20% of the crops of U.S. farmers. Many peacetime activities were abandoned to unite the efforts of agricultural extension specialists, leaders of farmers' organizations, entomologists of agricultural experiment stations, colleges of agriculture and employees of state, county and city governments throughout the entire United States. Of even greater importance was the proper storage and preservation of foodstuffs following harvest and especially the products being supplied to army cantonments and shipped overseas to the Allies. Losses occasioned by storedproduct insects such as grain moths, beetles, weevils and

mites, although tremendous during normal times, were unbelievable under war conditions. The devastation of vast stores of wheat by insects and rodents during World War I had prompted the British in 1940 to adopt drastic measures to preserve every pound of wheat, beans, peas, dried fruit, cured meat and other essential food products raised in or shipped into the United Kingdom. Accordingly, all the entomologists available were detailed to the tremendous task of food protection. The bureau of entomology and plant quarantine, U.S. department of agriculture, issued a large series of special circulars dealing with subjects pertinent to the national defense program. Topics treated in these circulars were: chiggers, bedbugs, cockroaches, fabric insects, fleas, houseflies, stable flies, screwworms, horse bots, food insects, fumigation, lice, mosquitoes, powder-post beetles and termites. To become really effective the work had to be carried beyond the fields and points of storage to the supply depots of the army camps and aboard naval ships. A large number of entomologists trained for this particular kind of work were available in 1941 for service in the quartermaster's department, where this important work was centred. The routine involves the use of suitable tight containers for the food, such as barrels, cans, closed bins, sealed packages and cartons; and airy, well-ventilated and dry storage and refrigeration facilities. In spite of all precautions generally taken, infestations seemed likely to appear, especially in products a year or more old. Although such contaminated food was unfit to eat, it often escaped detection. In addition to the insects actually breeding and living in the food products, buildings and ships could also harbour such nuisances as cockroaches, ants, houseflies, fleas, bedbugs, lice and other vermin that added to the spoilage of food supplies and to the discomfiture of the inhabitants.

Under such conditions control measures were imperative. These required the supervision of an expert experienced in the uses of heat, cold storage and such fumigants as hydrocyanic acid gas, calcium cyanide powder, methyl bromide, chloropicrin, sulphur dioxide, naphthalene, paradichlorobenzene, ethylene dichloride, carbon tetrachloride, ethylene oxide and other chemicals. These fumigants could not be administered without certain other complements such as tight compartments, bins, rubberized tarpaulins or special fumigating rooms and adequate gas masks for the protection of the operators. The conditioning of rooms and food supplies for fumigation required knowledge, experience and skill. The net results of such pest control operations prevented loss of supplies and guaranteed wholesome food.

Insects affecting the health and comfort of soldiers and sailors included crab lice, body lice, fleas, bedbugs and mosquitoes infesting the person and sometimes transmitting serious diseases such as typhus and trench fever. It was rather difficult to understand why lice, for instance, always appeared on soldiers concentrated in camps even though the establishments were new, whereas under normal conditions these insects are relatively rare even under the crowded conditions of large cities. One explanation was the lack of proper laundering and cleaning of clothes and a lack of hot-water facilities, often not available in temporary camps. The solution of the louse problem was an almost impossible one during World War I, although the principles of delousing by steam, boiling water, hot air and fumigating were well-known.

In European armies, especially in the German army, elaborate equipment had been perfected for the treatment of clothing by the use of powdered cyanide. The proper amount sealed in a tin can was placed in a machine

which automatically carried it into a small tight compartment which opened and emptied the fumigant and a short time later delivered the garments, heated and aired, to the soldier emerging unclothed from a spray treatment which ensured him a clean body and pest-free clothes. The bedding, all sleeping and personal effects and the barracks as well, were fumigated or otherwise treated for lice, bedbugs and fleas by the judicious use of dry heat, hot water, live steam, chemical dusts and sprays, fumigation, cold or hot storage or exposure to the sun. Body treatment consisted of clipping the hair closely and the use of mercurial ointments, mixtures of equal parts of kerosene and olive or other vegetable oil or kerosene and vinegar, special chemical soaps, oil and soap emulsions and a powder composed of 3% rotenone, 96% naphthalene +2% creosote +2% iodoform. The clothing, blankets and other woollen fabrics and furs could be protected from attacks of clothes moths and carpet beetles by moth-proofing with chemicals, the constant liberal use of naphthalene and paradichlorobenzene crystals, refrigeration and cold storage, fumigation and frequent exposure to the hot rays of the sun. Bedbugs were eliminated by fumigation with hydrocyanic acid gas, heating to 125°F. to 130°F. for 12 hr. and by spraying the bedsteads, walls, floors, ceilings and furniture with light petroleum oils.

The avoidance of mosquito-infested areas was a prime consideration in the establishment of permanent or even temporary camps for soldiers or civilians. In the subtropical and tropical regions, mosquito-free areas were not always available, but there was always the possibility of selecting places with the lowest populations or with the greatest opportunities for mosquito control. Such places should be either far from swamps, standing fresh or brackish water or sufficiently elevated to permit drainage and the elimination of standing water. Otherwise great expense had to be incurred in order to fill low places, pump out the standing water, clear away aquatic vegetation, treat the water with light oils, Paris green, borax, pyrethrum and other insecticides and to afford protection to the men by means of repellent sprays and ointments, netting. screening and other safeguards.

W. R. Thompson, superintendent of the Farnham House laboratory was stationed at the Dominion Parasite laboratory, Belleville, Ontario, Canada, where the Canadian government provided quarters and facilities for his work and that of his staff on the biological control of insect and plant pests during the war.

General Developments of 1942 and 1943.—The oriental fruit moth, Laspeyresia molesta (Cydia), was discovered in Orange county, Calif. in 1942; this was the first time the insect had been found on the Pacific slope of the United States. Larch sawfly, Pristiphora (Nematus) erichsoni, crossed Canada to the Okanaga valley, approximately the western limit of its host Larix occidentalis.

F. F. Smith conducted experiments in the control of the gladiolus thrips, *Taeniothrips simplex*, with tartar emetic combined with molasses and syrups—a relatively effective treatment.

Because of war needs many important insecticides were allocated for other purposes based on end use. Those most affected were antimony, arsenic, copper, mercury and zinc compounds, rotenone, pyrethrum and tar oils. Fortunately, considerable quantities of certain of these prepared remedies were still in the stocks of the insecticide manufacturers and therefore available as long as these reserve supplies held out.

Among the new and promising insecticides in 1942 were: basic copper arsenate for leaf-eating cotton insects; barium arsenate for controlling blowflies on sheep in Australia; phthalonitrile for leaf- and fruit-eating insects; thiourea and derivatives, which proved to be toxic to the larvae of flesh flies and to the larvae of the clothes moth; xanthone, which gave some promise in controlling codling moth on apples; potassium antimonyl citrate as a potential substitute for tartar emetic in the control of citrus thrips; phenothiazine, which proved toxic to the larvae of the blowfly in Australia and the codling moth larvae in the United States; calcium chloroacetate, somewhat less effective than sodium arsenite in grasshopper baits in South Africa and effective against maggots of the blowfly in Australia; selenium compounds, toxic to orchard mites, Tetranychus and Paratetranychus, on grapes, citrus, cotton, etc., in the United States; Paris green, a valuable larvicide for anopheline mosquitoes, as effective as pyrethrum and petroleum oil emulsions; dinitro-ortho-cyclohexylphenol and dinitro-ortho-cresol, very effective as aphid ovicides on dormant trees; nicotine, pyrethrum and rotenone compounds, still very important in the control of many insects infesting plants that could not be treated with heavy metal poisons. Derris or nicotine dusts were suggested as possible combinations with calcium arsenite dusts to kill both the cotton boll weevil and the cotton aphis with single applications. Acrytonitrile and chloracetonitrile were shown by H. H. Richardson and A. H. Casanges to be promising new fumigants for the control of the confused flour beetle and the bedbug. Arsenate of lead was still considered to be the most effective stomach poison for the control of codling moth, especially for the calyx and first cover sprays. A new cockroach poison, 4, 6-dinitro-o-cresol, was reported by J. B. Gahan to be more toxic to cockroaches and to kill them more rapidly than either sodium fluoride or pyreth-

A summary of the advances in entomology up to the time DDT appeared was published in 1942 by C. H. Richardson, giving a fair idea of the great amount of research and field trials devoted to a vast number of new insecticides which were appearing at that time.

First tests were made in the control of body lice with DDT by members of the U.S. department of agriculture bureau of entomology and plant quarantine at Orlando, Fla. Powder and liquid preparations were formulated and the impregnation of garments was also perfected. This work paved the way for the use of DDT by the armed forces of the Allies. Similar successful tests were made in the control of bedbugs, houseflies, stable flies, fleas, cockroaches, ants, mosquitoes and many other household and agricultural insect pests. This new insecticide was singled out as one of the greatest discoveries of the time.

In 1943 W. R. Thompson edited a catalogue of the parasites and predators of insect pests, of great use to all entomologists and especially to those interested in biological control.

The tomato russet mite, *Phyllocoptes destructor*, was found to be injuring tomatoes in two counties in Colorado in 1943, but was readily controlled by dusting with sulphur; the case of controlling this mite made it appear much less dangerous than was first feared. Breaking in colour of the flowers of the annual phlox (*Phlox drummondi*) was shown by H. H. P. Severin to be due to asteryellows virus transmitted by the leafhopper, *Macrosteles divisus*, in California. The cabbage butterfly, *Pieris rapae*, a pest in Australia first found in Victoria in 1939, reached

New South Wales, Tasmania, and south Australia in 1940 and Western Australia in 1943.

A report on the organization set up in Brazil for the permanent nation-wide anti-Aëdes aegypti measures was issued in 1943 by the Rockefeller foundation. A monographic historical review of Anopheles gambiae in Brazil was also published by F. L. Sopher and D. B. Wilson of the Rockefeller foundation. In Sept. 1943, four females and one male of the yellow fever mosquito, Aëdes aegypti, were collected from east-central Oklahoma; this mosquito had not previously been recorded so far west at such a northerly latitude. The tropical rat flea, Liponyssus bacoti, was collected in Kansas for the first time, during the year.

A new soil fumigant, Shell D-D, was first used in 1943 by W. Carter in controlling soil mealy bugs in Honolulu; it also gave great promise in killing other soil insects and nematodes. Dinitro-ortho-cyclo-hexylphenol was used by L. M. Smith and C. A. Ferris as an effective ovicide for the mealy plum aphid, *Hyalopterus arundınis*, when applied in Feb. 1943 in California. This added a new method in dealing with aphids which pass the winter in the egg stage on deciduous trees and shrubs. United States patents on DDT were issued to Geigy Co., New York, N.Y., Sept. 7, 1943, and the first of this new insecticide was received in the United States for experimental purposes.

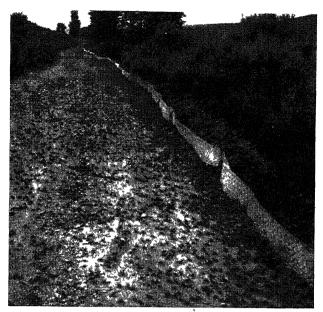

Events of 1944 and 1945.—The importance of entomology to the war effort in 1944 and 1945 was most forcibly expressed in the control of insects affecting human health. The subjection of malaria and typhus were the most outstanding accomplishments and the entomologists in the medical and sanitary corps added much to the success of this work. DDT was the outstanding insecticide employed. The preferred repellent for chiggers, because of cheapness and availability, was pure dibutyl phthalate, offering protection for 59 days. A band one-half inch wide was applied around the inside trousers and cuffs, the fly and neck of the shirt and a wider band around the upper parts of the socks. The recommendations were by A. H. Madden, A. W. Lindquist and E. F. Knipling.

Figures for 11 years' study of the black widow spider, Latrodectus mactans, in Maryland, released in 1944, showed that cases of poisoning from their bites, severe enough to require hospital treatment, were rare, with no fatal cases known. According to R. H. N. Smithers most of the cases of illness or death due to the bites of the females of Latrodectus indistinctus in South Africa occurred during the harvest season in the grain lands of the coastal belt of the western province.

The oriental fruit moth was discovered during 1944 on peaches, pears and other fruits in Orange county, Calif. It had completely crossed the continent of North America from Washington, D.C., where it was first introduced in 1916.

G. F. Finney, S. E. Flanders and H. S. Smith effectively employed the potato tuber moth, *Gnorimoschema operculella*, reared on potato tubers for the mass production of the parasite, *Macrocentrus ancylivonis*, for liberation in the orchards for the control of the oriental fruit moth, *Cydia molesta*, discovered in California.

The first introduction of insects into the United States for the control of a plant pest was a notable step in a new field of biological control in 1944. The insects in question were the chrysomelid beetle, Chrysomela quadrigemina (Chrysolina gemellata), and the buprestid beetle, Agrilus hyperici. They were imported by plane from Australia and arrived at their destination at Berkeley, Calif. Oct. 16, 1944. The object of this introduction was for the possible

Field barriers of metal used to control crickets

control and elimination of the St. John's wort or Klamath weed, Hypericum perforatum. This European weed had been widely distributed throughout the northwestern United States, chiefly through the agency of sheep and cattle. In many states it was of little consequence, but in parts of California, notably in the Sierra foothill counties of Nevada, Butte, Shasta, Del Norte and Humboldt, it had invaded literally thousands of acres of good grazing lands and made large areas of grasslands almost useless for grazing sheep, cattle and horses.

The bright green chrysomelid beetle, native to middle and southern Europe where it feeds only upon species of *Hypericum*, had been introduced by air from France into Australia in 1939 and 5,400 adults were liberated in August and October. Adults were not recovered until Oct. 1942, when some 4,000 were collected in one day. It was well-established in one locality in Australia and, because it flies readily, was becoming widely dispersed; there were great hopes for its effectiveness in destroying the St. John's wort.

The buprestid beetle, infesting only the roots of the weed, was not as conspicuous in its work as the former, but it nevertheless held promise as a most effective enemy of the St. John's wort. It was introduced into Australia from France in 1939 and 1940; 6,617 adults were liberated in four places in New South Wales, in all of which it at once became established. The beetle appeared to be a very effective enemy of the weed and as many as four larvae were found in a single root; many plants had already been killed by 1944.

Methyl bromide was extensively used in freeing clothing of the troops in the United States army from the body louse, *Pediculus humanus*. At this time DDT also was being experimentally used for the same purpose and quickly replaced all other methods for delousing. Extensive experiments were also under way in the use of DDT for the control of flies, bedbugs, mosquitoes and other insects and ticks in relation to the war effort. Tests were likewise being made in the control of all insect pests affecting humans, domestic animals, forests and agricultural crops and products. The production of DDT was taken over by the U.S. armed forces in 1944. The actual manufacture was assigned to certain chemical manufacturing companies—first to J. R. Geigy followed by E. I. du Pont de Nemours

& Co., Inc., Wilmington, Del., Hercules Powder Co., Inc., Wilmington, Del., Merck & Co., Rahway, N.J., and many others.

E. A. McGregor found that citrus thrips in southern California, which in 1939 and 1941 were easily controlled by spraying with tartar emetic and sugar, appeared to be resistant to this spray from 1942–44 and later.

The first comprehensive report on extensive experiments with DDT was issued by the bureau of entomology and plant quarantine in Feb. 1944. In it were described 50 separate experiments involving many kinds of insects; the report gave a fair idea of the many uses of this new insecticide.

In February, March and April 1944, the typhus outbreak which was raging in Naples, Italy, was completely stopped by applications of DDT dusts on all humans and the treatment of clothing to kill the lice and thus prevented the spread of the disease.

R. Wasicky and O. Unti showed that mosquito larvae were killed in periods of less than 5 minutes for a DDT concentration of 1:1000; up to 4.7 hours for one of 1:25,000,000; from 24.36 hours for one of 1:50,000,000; and more than 36 hours for one of 1:60,000,000. W. B. Herms and H. F. Gray, testing *Culex tarsalis* larvae and using DDT dissolved in ethyl alcohol and water, reported that dilutions of 1:600,000,000 by weight killed 45 of 50 larvae and 4 of 10 pupae in 48 hours.

During 1945 a number of investigators, including L. Haseman, J. P. Johnson and R. Stadel found that sulfathiazole, fed either in sugar syrup or in pollen substitutes, was an effective control for the disease, American foul brood, of honeybees.

The control of horn flies in cattle with DDT proved very effective and beneficial in 1945, especially to the dairy industry.

Rotenone, pyrethrum and nicotine compounds, so necessary in the protection of vegetable crops, were almost completely restricted for aerosol bombs, sprays and dusts for the armed forces prior to V-E day and V-J day. Arsenical poisons, sulphur and fluorine compounds, oils, cyanides and other necessary insecticides were often extremely scarce or altogether unavailable. Only small allotments of DDT were made available for small scale investigations and tests against agricultural insect pests. During the late war period there was also a trying shortage of spraying, dusting and fumigating equipment, and parts for the old equipment that was fast wearing out.

Methods of Applying DDT.-(1) As space sprays-aerosols, vapour sprays, and fly-sprays for killing insects on the wing in open spaces usually in buildings, tents, ships and in other enclosures. Out-of-doors they may be applied by aeroplane for mosquitoes, flies, gnats, sand flies and other insects that are moving freely in the air or resting on exposed vegetation. (2) As a fog spray-applied by means of a special fog machine, a modification of the smoke machines of the U.S. armed forces, in which the DDT is vaporized and mixed with steam and applied as very minute particles under high pressure as a fog. (3) As a residual spray-applied to surfaces which are resting places for insects; to runways; to light cords; hiding places and other surfaces frequented by insects, where residue may be deposited for prolonged effectiveness. (4) As dusts-dry mixtures containing 4% to 10% DDT diluted with a carrier such as talc or pyrophyllite; one part of DDT to nine parts of the carrier. (5) As suspensions-wettable or water-dispersable DDT powders, with wetting

agent to permit mixing with water. These powders are not soluble; the small particles being held in suspension. They are applied as sprays and paints. (6) As emulsions—DDT in solvents (white kerosene, xylene, etc.) plus a casein or other emulsifier to which water is added. This forms a true solution and is used at the rate of one gallon to cover goo sq.ft. of surface. It is applied to surfaces to kill insects resting or moving across them, and lasts over periods of one to three months.

DDT Compounds: (1)-Aerosols, or aerosol bombs. These were developed chiefly for use of the U.S. armed forces. The bomb is the container, usually metal, in which the insecticide is held. It does not explode. The aerosol is the insecticide contained in the bomb. It consists of the DDT together with some other material in liquefied gas under pressure. The contents are discharged by opening a valve which releases the pressure causing the dispersal of the insecticide in the air as a mist or fog which rapidly diffuses. The small particles hit the insects and kill them by direct contact. The contents of the bomb, as used by the armed forces, usually consisted of a mixture of DDT and purified pyrethrum extract with Freon 12 as the liquid gas carrier. This propellent Freon 12 was the most satisfactory chemical used during World War II as a propellent for aerosols to be employed in the presence of humans. Methylene dichloride appeared to be the most practical diluent of Freon 12 for insecticides. It is nontoxic to man, and is also noninflammable, and can be substituted for Freon 12 up to one-third of its weight.

Aerosols are used chiefly for such flying insects as mosquitoes, flies, gnats, sand flies, clothes moths and others in dwellings, factories, hospitals, aeroplanes, tents and similar confined areas. Aerosols are useless for the control of such crawling insects as lice, fleas, cockroaches, earwigs, caterpillars, as well as the various immature stages of most insects. It is not classified as a fumigant.

(2)—The Fog or Smoke Method of applying DDT in concentration of 2% or 3% proved quite effective for many purposes. The fog can be blown great distances and is quickly applied in barns, houses, tents and other buildings to kill adult flies, mosquitoes, gnats, sand flies and other insects. It has also been used to treat stadiums, parks, beaches and other large open gathering places to free them of these insects.

DDT is destructive to many kinds of beneficial predacious and parasitic insects when used as a contact or residual dust or spray. It may suppress the natural enemies of many insect pests and thus permit the latter to gain considerable headway and even require additional control measures. Thus, aphids often increase in great numbers as a result of killing the ladybird beetles, predacious bugs, green lacewings, brown lacewings, syrphid flies and the very effective hymenopterous parasites.

Investigations following the applications of DDT to forests and wild areas showed that pronounced mortality of wildlife resulted from the use of most of the higher concentrations of two pounds or over per acre.

Very extensive experiments with DDT in all fields of entomology were reported during 1945. The progress of this insecticide marked a great epoch in the history of entomology. The literature on the new chemical had already become very voluminous.

Ethylene dibromide: This insecticide is especially useful as a soil fumigant for the control of nematodes, garden centipedes, wireworms, white grubs and other subterranean plant pests. It appears to be particularly promising for

killing wireworms, but must be used on land free from growing plants.

Benzine hexachloride or 666: This insecticide had, to a much lesser degree, somewhat the same type of publicity in Great Britain as DDT had in the United States. However, it does not appear to be either as versatile or as effective as the latter, although it is quite similar in many respects and is effective in killing many insects. It appears to be less toxic to man and domestic animals. It is usually applied as a powder and is quite toxic to plant bugs, granary weevils and other insects.

Sabadilla: Sabadilla was further experimented with on a much larger scale during 1945. It was applied chiefly as a 5% or 10% dust or powder and proved toxic to many insects.

Orthodichlorobenzene: This new insecticide gave very effective results in the control of many household and stored-products insects as well as pests of fruit trees and many agricultural crops; it was used as a contact spray, as a solvent for aerosols and mixed with other insecticides.

Entomology in the Postwar Period.—At the close of the war with Japan on Aug. 14, 1945, an unprecedented rush of released U.S. servicemen to the universities and colleges began. Graduate students in entomology taxed the facilities of all the important entomological departments of the United States to the extent that a limit of numbers was necessary in some institutions.

After extensive experimentation for two years DDT was used on a large scale in 1946 for the control of insects attacking domestic animals and agricultural crops. Among the latter were the Japanese beetle, codling moth, lygus bug on alfalfa and beans, onion thrip, pea aphid, pea weevil in the field and many other important pests.

The Queensland fruit fly, Dacus ferrugineus tryoni, was first discovered in Honolulu, Hawaii, in 1946. (See also Agricultural Research Administration; Chemistry; Public Health Engineering.)

Epidemics and Public Health Control

In the period 1937–46, great strides were made in the control of many contagious diseases—advances which gave promise of control of several major infectious diseases which had been scourges of mankind for centuries.

Most of the important developments in the public health control of epidemic diseases were stimulated by World War II and its associated public health problems. These discoveries and others made in years previous to the war were quickly developed and applied on a large scale. Previously known control measures were intensified, and in many cases were improved and made more effective.

As a result of the use of new and improved public health, techniques, epidemics of contagious diseases such as had accompanied previous wars were prevented or minimized.

Among the most significant advances made during the decade was the development and application of the chemical DDT (dichloro-diphenyl-trichloroethane), as an insecticide. DDT was first prepared in 1874, and was not known to have insecticidal action until this was reported by a Swiss firm in 1939. Further experiments quickly demonstrated the great value of the chemical in the control of insect-borne diseases, and it was soon widely applied. Its effectiveness against the major world-wide epidemic diseases, such as typhus, malaria and yellow fever, which are transmitted to man by insects, made it one of the most important health weapons known to man.

Another great contribution which helped to reduce deaths from many contagious diseases was the discovery and use of the highly effective treatment agents, the sulfonamide and antibiotic drugs.

These drugs provided effective methods of treatment in many diseases for which no adequate treatment had been previously known, and supplemented or replaced less effective methods of treatment in other diseases.

The sulfonamide drugs were first discovered by chemists in the dye industry, and were later found to be useful in the treatment of a large group of bacterial diseases, such as pneumonia, epidemic meningitis and streptococcal infections.

New derivatives, which were more effective and less toxic than the original compound, sulfanilamide, were also developed. In 1929, Dr. Alexander Fleming had isolated the chemical, penicillin, from a mould. In 1940, this drug was used by Dr. H. W. Florey and his associates in the treatment of some human infections, and it was found

Volunteer allowing lice to feed on his back at the laboratories of the U.S. department of agriculture in 1943. The lice were placed on the host's back by means of cloth squares. This method was used to maintain a supply of lice for testing new insecticides for the U.S. armed forces

to be highly effective. This drug, and other antibiotics subsequently isolated from other moulds and soil bacteria, such as streptomycin, were important contributions to the treatment of many diseases.

The development and application of other drugs, such as atabrine in malaria and para aminobenzoic acid in typhus, were also important advances. The introduction and perfection of preventive vaccines during the decade made it possible to provide protection against the development of diseases such as influenza, typhus, whooping cough and yellow fever.

Although much progress was made, diseases such as diphtheria, malaria, syphilis and tuberculosis continued to present serious problems, and other diseases which had been relatively unknown to the medical profession were more widely recognized. (See separate articles on Infantile Paralysis; Tuberculosis; Venereal Diseases.)

Malaria.—Malaria, always one of the greatest world-wide public health problems, was especially important during World War II, when large numbers of troops were sent into areas where this disease was not adequately controlled.

The drastic reduction in the supply of quinine, because of Japanese occupation of areas where the drug was produced, made it necessary to find a substitute.

Atabrine, a drug which was previously used to a limited extent in malaria, was found to be effective as a substitute for quinine, and was extensively used by the armed forces in the control and treatment of the disease.

Malaria is a mosquito-borne disease. New methods of mosquito control, such as the use of DDT, were discovered and extensively applied to control mosquito infestation

in areas where malaria was endemic.

The use of these new and improved procedures throughout the world assisted in the struggle to bring malaria under control. In the continental United States, these methods promised to minimize or eliminate the possibility of spread of malaria from troops returning from overseas.

Typhus Fever.—Typhus fever had often become epidemic in periods of war. Although several outbreaks of the disease occurred during World War II, methods for control were available and widely used. Without these control measures, the disease might have become epidemic throughout the battle zones of Europe and Asia and would have claimed many more lives.

The first of the control measures was the use of vaccine for preventive inoculation. Troops entering areas where typhus was known to exist were protected by the use of this vaccine. In addition to preventive inoculations, it was found that DDT was an effective agent in typhus fever control. Application of this chemical, poisonous for the body lice which spread the disease, as a dusting powder to the clothing and body quickly eliminated body lice and thereby quickly stopped spread of the infection.

The effectiveness of DDT was demonstrated in an outbreak of typhus which was beginning to reach epidemic proportions in Naples, Italy, at the time of its occupation by the Allied forces. The immediate use by the U.S. occupation forces of DDT "dusting" brought the epidemic under control within a short period of time.

Diphtheria.—In many parts of Europe during the war years, diphtheria again became one of the most serious public health problems and assumed epidemic proportions in many places. The incidence and mortality of diphtheria in the United States, however, was maintained at a low level. This was attributed mainly to extensive adoption of immunization programs throughout the nation. A higher percentage of cases in adults than formerly occurred was noted during the decade 1937–46.

The material used for immunization was improved in efficiency during this period. The material called "plain toxoid," formerly used, was replaced almost entirely with a preparation known as alum-precipitated diphtheria toxoid.

Bacteriological studies of the diphtheria bacillus were continued, and it was found that human cases caused by a variety known as "gravis" type caused more severe, and more frequently fatal, illnesses than those caused by other types. Although preventive inoculations were known to provide a means of protecting children from the disease, it was discovered that subsequent reinforcing or "booster" injections were necessary to provide maximum protection.

Influenza.—Throughout the decade, epidemics of influenza occurred at two- to three-year intervals, but none approached the pandemic of 1918–19 in extent or severity.

The work of C. H. Andrewes, P. P. Laidlaw and T. Francis, among others, in isolating and identifying the viruses which are the causative agents of influenza, was continued and further progress was made. Several different varieties of influenza virus were isolated and identified.

A vaccine containing two types of influenza virus was used extensively by the army and navy during the war to reduce the incidence of influenza in troops, and good results were reported. This vaccine was made available for the civilian population in 1945, and evidence was obtained which indicated that it might prove to be of value in protecting the population against epidemics of the disease.

Measles.—A material known as gamma globulin, one of the protein fractions of human blood, was found to be effective for the prevention or lessening of severity of measles. This material, if given in the first week or so after exposure, could prevent the development of measles; or, if given later in the period before symptoms developed, would lessen the severity of symptoms, producing a "modified" measles.

Gamma globulin provided a material causing less reaction than "placental" globulin, which had been developed earlier. The use of this material helped reduce the number of deaths from measles and its complications.

Whooping Cough.—Much progress was made in the improvement of materials used for immunization against whooping cough. The work of Dr. Louis W. Sauer, Dr. Pearl Kendrick and others led to the development of much more effective vaccines. Increased use of these vaccines reduced the incidence of whooping cough in the United States.

To reduce the mortality from whooping cough in the early months of life, studies were carried out in which inoculations were given to infants in the first few months of life. On the basis of that study, early inoculations were recommended.

Material from blood containing protective substances against whooping cough also was developed. Evidence indicated that this serum might be of value in the treatment of the disease and might protect persons known to have been exposed.

Virus Encephalitides.—Outbreaks of disease in the United States and elsewhere characterized in humans by central nervous system symptoms, such as coma and paralysis, were intensively investigated. Laboratory methods showed that, although symptoms in the different outbreaks were similar, several distinct types of viruses were involved.

Investigation of the outbreaks led to the discovery that birds and animals also were affected by these diseases and might be the source from which human outbreaks began. Information was also found regarding the probable role of insects in carrying some of these diseases from these reservoirs of infection to man.

Tropical Diseases.—The advent of World War II brought into new prominence many tropical diseases, such as a "scrub" typhus, schistosomiasis, filariasis and dengue fever. Intensive investigation of the cause, means of transmission, and methods of treatment of these diseases during the war years made a striking contribution to public health control methods. Advances made as a result of the war research promised to be of great benefit in controlling these diseases.

Yellow Fever.—Yellow fever still presented a major public health problem in many tropical areas. No major epidemics of this disease, however, were known to have occurred during the ten-year period.

A number of important discoveries were made which led to improvement of control measures against yellow fever. Vaccine was perfected during the decade and was widely and successfully used among troops.

Field investigations carried out by scientists of the Rockefeller institute and others provided new information regarding the source and transmission of yellow fever. The ordinary type present in the urban areas of tropical countries was known to be carried by the Aedes aegypti mosquito.

In investigations of the disease in jungle areas where Aedes aegypti mosquitoes were not present, it was found that jungle mosquitoes were the means by which the disease spread. This discovery was of importance in the

control of jungle yellow fever, since the usual mosquito control measures were difficult to apply. Vaccine inoculation was necessary to control.

New Diseases.-Among the most important infectious diseases which were recognized for the first time during the decade or had been believed less widely spread, were those described below.

Evidence indicated that a virus or group of viruses was the cause of outbreaks of primary atypical pneumoniaresembling influenza and pneumonia-during the decade.

Infectious hepatitis was epidemic in groups of the armed forces throughout many parts of the world. The cause was not definitely established, but it was found that it could be transmitted by personal contact, and also by contaminated water and milk. Injection of small quantities of gamma globulin, one of the protein fractions of human blood, was found to be effective in preventing infection in persons known to have been exposed to this disease.

Keratoconjunctivitis causes inflammation in the coverings of the eye and, in a small percentage of cases, may leave opaque spots in the cornea, thereby causing more or less loss of vision.

Outbreaks which occurred in 1941 and 1942 in the United States may have been imported from Hawaii. The cause was found to be a virus.

Ornithosis, with symptoms like that of primary atypical pneumonia, is caused by a virus which in some cases appeared to be transmitted to man from pigeons.

Q fever, which had first been described in 1935 in Australia, was later found to exist in other parts of the world, and small epidemics were known to have occurred among troops in the Mediterranean area. Its cause was found to be one of the minute bacteria called Rickettsia. The method by which this disease was spread was not definitely established, and no effective means of control had been developed by the end of the decade.

Ringworm of the scalp, caused by fungi, appeared in epidemic proportions in the United States for the first time, so far as was known, about 1940. It was first observed in epidemic proportions on the Atlantic coast and later became more widespread throughout the United

It does not cause serious illness and in practically all cases disappears at puberty.

In addition to the diseases discussed above, other epidemic diseases, such as bacillary dysentery, epidemic cerebrospinal meningitis, pneumonia, scarlet fever and typhoid continued to present problems during the decade. Scientific investigations relating to the cause, means of transmission, control and treatment were carried out. The most notable advances made in medical knowledge of these diseases were in the development of more effective means of treatment:

Estonia

From 1918 to 1940, when it was incorporated in the U.S.S.R., Estonia was an independent republic on the Baltic coast, bounded on the east by the Narva river and Lake Peipsi, on the south by Latvia, and including the Baltic islands of Saaremaa, Hiiumaa and Muhamaa. Covering an area of 47,559 sq.km. or 18,363 sq.mi., Estonia had in 1939, a population of 1,133,940 of whom 88.2% were Estonians, 8.5% Russians, 1.2% Germans (Balts) and 2.1% other nationalities. Estonia was therefore the most homogeneous state in eastern Europe. Chief towns: Tallinn (cap. 145,000); Tartu (60,100); Narva (24,200); Pärnu (21,500).

The Estonians are neither Slavs nor Teutons. They are members of the Ugro-Finnish race, and the Estonian language is closely related to the Finnish and remotely to the Hungarian. Their religion is predominantly Lutheran (78%); there was a 19% minority of Orthodox Christians

Konstantin Päts was president of the republic and prime minister from Oct. 21, 1933; on May 6, 1938, he appointed as prime minister Kaarel Eenpalu, and on Oct. 12, 1939, a coalition government under Jüri Uluots. On June 18, 1940, the Russians appointed as prime minister Johannes Vares (Max Unt). On Aug. 6, 1940, when Estonia "joined" the U.S.S.R., Vares became chairman of the praesidium of the supreme soviet of the Estonian S.S.R. His death was announced from Moscow on Dec. 1, 1946.

Two Short Decades of Independence.—On Feb. 24, 1987, the Estonians were celebrating the 19th anniversary of their independence. They had every reason to rejoice, for by comparison with any other period in their history these years had been a golden age. Seven centuries before, their ancestors had been conquered by the Teutonic Knights, who treated them as an inferior race, making them hewers of wood and drawers of water for a German ruling class. In 1625 Sweden assumed suzerainty over Estonia, and in "the good old Swedish days" the Germans' privileges were somewhat restricted; but after 1710, when the Russians succeeded the Swedes as sovereigns, the Estonians were subject to a double bondage-to the tsarist officials and to the Germans who were still the landowners and practical masters of the country. Not till after 1917 were the bonds broken. After a terrible and manysided fight, against reich Germans and against local Germans (Balts), against tsarist Russians and against bolshevik Russians, the Estonians, led politically by Konstantin Päts and militarily by Johan Laidoner, achieved their independence.

Looking back from the vantage point of 1937, the Estonians might well be satisfied with their achievement. Without any experience of self-government, they had established a republic with all the civil liberties and representative institutions of the old democracies of the west.

They had established a system of public education that could compare well with any in the world; 1 in every 340 of their people was going to Tartu university. With every experience of racial intolerance and neighbourly ill-treatment, they had been tolerant at home and good neighbours in foreign policy. The German Estonians (Balts) had been dispossessed of most of their land but not otherwise victimized; like other racial minorities, they enjoyed full civil liberties and had officially-chartered organizations for the conduct of their own cultural life. As a member of the League of Nations, Estonia had fulfilled all its obligations; it had indeed been the only country to pay interest on a League loan promptly and in full. With its Russian neighbour, it had signed a non-aggression pact in 1932. Without any experience of economic independence, the Estonians had established a social democracy, dividing the land among peasant-proprietors so that the average Estonian was a landowner working a holding of 12.4 to 124 ac. with the labour of his family and a couple of horses. Under this system, productivity per man and per acre increased enormously. A network of peasant co-operative societies spread until it achieved a monopoly of the butter and milk trade. Exports of dairy and timber produce were developed with the west, and industries were founded for processing agricultural products and wood and for textiles and shale-oil. By any comparison with its Russian neighbours or with its own past, Estonia was a prosperous as well as a free country.

Yet the years before 1937 had not been without their misfortunes. To cope with the falling agricultural prices and unemployment of the world economic crisis of the early 1930s, strong government action was necessary, and that was impossible under the Estonian constitution of 1920 which left the executive at the mercy of a multiparty house of parliament. The obvious way out was to adopt a new constitution which would give sweeping powers to a president. A proposal to this effect was accepted by referendum in 1933, but the lead in this was taken by an ugly organization known as "Vaps" (Vabadus Sõjaleste Liits or Ex-Service Men's league) which smacked all too clearly of naziism. Rather than risk the election of a "Vaps" nominee as president, Päts, the acting head of the state, assumed supreme power in 1934 and appointed Laidoner as commander-in-chief. From 1934 to 1937 Päts ruled as a benevolent dictator, popular because of his government's help to industry and agriculture and because of the mildness of his restrictive measures. In 1936 his proposal for a constituent assembly consisting of two chambers was accepted by referendum. The new chambers met in Feb. 1937.

Their task was to draw up a new constitution which would strike a balance between the excessively libertarian constitution of 1920 and the excessively authoritarian document of 1933. In this they succeeded. The constitution of 1937 apportioned power by subtle checks and balances between two houses of parliament and a president.

The elections of April 1938 returned Pats to the presidency.

Estonia had won its way back to constitutional democracy, surmounting the difficulties of the mid-1930s with less difficulty than most of the older states of Europe. The new regime was a success. Prosperity increased in every class, particularly among the agriculturists (67% of the population), whose net farm income was 10% higher in 1939 than its pre-crisis level. The only serious complaint of the

"While the Sun Shines." This cartoon by Little of the Nashville Tennessean was drawn after Russia completed the first of its series of dictated Baltic pacts—with Estonia on Sept. 29, 1939

opposition, led by Liberals like Jaan Tönisson and Ants Piip, was that rights of assembly and of press freedom, though guaranteed by the constitution, were a dead letter. Pats's reply was that the international situation made restriction necessary.

Germany's advance to the east, culminating in the annexation of Memel, Lithuania, in March 1939, was potentially a menace to Estonia. Russia's declaration, immediately after the Memel seizure, that Latvia and Estonia were part of the Russian sphere of vital interest was also a menace. The Estonian policy was to give no allegiance to any great power, hoping that through blameless neutrality its independence might be preserved. It already had a non-aggression pact with Russia. In June 1939 it signed a similar pact with Germany. When Russia, replying to the British request to join in guaranteeing Poland and Rumania, insisted that Finland and the Baltic states be included in the guarantee, Estonia, like the others, refused, and the British did not urge it to accept. But the pact between the U.S.S.R. and Germany on Aug. 23, followed by the German and then by the Russian advance into Poland, left Estonia isolated from the west, and when Vyacheslav Molotov presented the Estonian foreign minister Kaarel Selter with a pact of mutual assistance he had no alternative but to sign. This pact of Sept. 29 gave Russia naval and air bases in Estonia. The Estonian's only consolation was the undertaking given in Article V: "The realization of this pact should not affect in any extent the sovereign rights of the contracting parties, in particular their economic systems and state organization."

The next nine months were a parlous but not a bad time for Estonia. Russia made war on the Finns for refusing to sign a similar pact. Hitler sent agents to persuade the German minority to leave Estonia, and some 15,000 of them obeyed. The Baltic being closed, Estonia had to divert its exports to Germany and to Russia. But the

Russian troops in Estonian territory were unobtrusive, and there was no interference with Estonia's internal affairs. Under a new coalition government, led by the Agrarian Jüri Ulnots and the Liberal Piip, the tempo of domestic reforms increased and the cultural and economic bonds with Latvia and Lithuania were tightened.

Into the Maelstrom.—Then, suddenly, on June 16, 1940, the whole situation was changed by an ultimatum announcing that Russia would occupy Estonia. Latvia and Lithuania received similar ultimata.

Tanks and troops of the Red army arrived in Tallinn, tollowed by the soviet supreme councillor Andrey A. Zhdanov. There was nothing for President Pats to do but accept a new government of Zhdanov's nominees. These were not Russians but Estonian literary men of the extreme left, headed by the poet Johannes Vares.

Vares announced on July 5 that new elections would be held on July 14 and 15. This was a violation of the Estonian electoral law, and the procedure for the election was a violation of all decency. No candidate was allowed to stand unless nominated by a newly-created "Working People's Union"; all other candidates including Tönisson, the grand old man of Estonia, were arbitrarily disqualified. The electors, dragooned by Russian troops and offered no alternative list of candidates, were said to have voted for the official list by 97%. There was no check on the vote-counting, and the Russian news-agency announced the result before the close of the poll.

During the period of the election, not a word had been said about any change in Estonia's independent status, but when the new assembly met on July 21-at the same time as similarly "elected" assemblies in Latvia and Lithuania-the first motion was that Estonia should join the U.S.S.R., which was carried by show of hands. No one in the outside world had any doubt as to what was happening. The acting secretary of state of the United States announced on July 23: "During the last few days devious processes, by which the political independence and territorial interests of the three small Baltic republics were to be deliberately annihilated by one of their more powerful neighbours, have been rapidly drawing to their conclusion." The conclusion came on Aug. 6, when the supreme council in the Kremlin accepted Estonia's admission into the U.S.S.R.

A reign of terror followed. All the best known public men-including Päts, Laidoner, Ulnots and Piip-were taken into captivity in Russia. Nearly 60,000 Estonians, leaders of public opinion, political, intellectual and religious, with their wives and children, were killed, imprisoned or deported. Education was put under communist control. Religious teaching and broadcasting were stopped; the faculty of theology at Tartu was closed, the Salvation Army dissolved, the Petseri monastery turned into a Russian barracks. Industry and urban house-property and land were "nationalized." The co-operative societies were "purged." No citizen was left with any securable legal rights, and the presence of the Red army and N.K.V.D. (Russian political police) made opposition impossible, except in the forests, where thousands of young Estonians went into hiding.

On June 22, 1941, Hitler invaded Russia. The German panzerdivisionen went through the Russian defenses in Lithuania and Latvia without difficulty, by-passing Estonia and cutting off the Russian forces, which had to flee by sea from Tallinn. The Estonians neither resisted nor welcomed the Germans. After a year of Russian occupation they were convinced that nothing could be worse than Russian rule, but they had enough historical experience

of Germans to know that German rule would be but little better. The Germans could find no collaborator better known than an obscure Dr. Hjalmar Mae, an old Vaps man. They made Estonia a zone of the new German province of Ostland. They did not restore the private property which the Russians had nationalized, but retained it on the ground that since the Estonia they had conquered was part of the soviet union (Germany had been the only state to recognize the soviet incorporation), soviet state property became German state property. They put in their own nominees to run the co-operative societies. They drove men out of employment so as to leave no alternative but enrolment in German labour battalions or armaments work.

For three years Estonia was under German occupation, impoverished, dragooned and dispirited. By Feb. 1944 the Russians were back on the Narva front. In alarm the Germans forced more and more Estonians into military

service: about 17,000 had been called up in 1943; another 48,000 were forcibly mobilized in 1944. In the summer the Russians' break-through came, and the Germans were in retreat. In the confusion, tens of thousands of Estonians succeeded in fleeing the country, by sea to Sweden if at all possible or by land into Germany, where they hoped to meet the forces of the western powers and so be safe from the Russians. In Tallinn a national committee of patriots led by Dr. Otto Tief, an ex-minister of justice, emerged from underground as the Germans were leaving the capital and on Sept. 20 flew the national flag from the citadel and proclaimed Estonia to be independent again. Two days later the Russian troops reached Tallinn.

With the restoration of the soviet republic again, tens of thousands of Estonians were deported to Russia. In their place came tens of thousands of settlers from the east. This time Moscow seemed determined not only to bolshevize Estonia but to russify it. It was announced that Tallinn was to be extended to house 500,000 people; its pre-war population had never exceeded 150,000 and the increase could come only from non-Estonian immigrants.

The Moscow government made great efforts to secure the return of Estonian refugees to the union. But of the 30,000 in Sweden and of the 50,000 in western Germany, only a handful would consent to go back. The free, highly cultured and prosperous Estonia of the years of independence had gone; in its place was something to which they did not wish to return. Yet they lived in hope that most of the nations of the world, including Britain and the United States, had not, even by the end of 1946, recognized the soviet incorporation of Estonia; to them Estonia was still de jure an independent republic.

Etching

The period immediately preceding the outbreak of World War II found etching, as a medium of original pictorial expression, either taking root or already flourishing in the art life of nearly every civilized nation. First centred in Germany and the Low Countries in the 16th and 17th centuries, the principal interest and activity in the medium on the part of creative artists shifted to Italy in the 18th century and to France in the 19th.

Continental Europe.—By 1937, the beginning of the period covered by this article, the great school of French etching had come to a close with the deaths of F. H. Buhot, A. Lepère, and J. L. Forain, but interest in the medium had been carried on by such accomplished practitioners as A. M. Beaufrère, E. Béjot, J. P. V. Beurdeley, A. Brouet, R. Dufy, A. Féau, J. E. Laboureur, M. Laurencin, H. Matisse, A. A. M. D. Segonzac and others. Their places were gradually being taken by a group of younger men and women who were turning

more and more to line engraving as a medium, and to book illustration as a field of graphic expression. The light of etching still burned brightly in France, the country which had made such a rich contribution to the art in the past, right up until 1939. Then came the great catastrophe and the light went out, here as elsewhere in Europe, or was kept alive only by the devoted few under cover of the darkness that followed. Throughout the period of the war, publication and distribution were impossible and little, if any, news of what living French etchers were doing reached the rest of the world. Upon the cessation of hostilities, however, they emerged from the obscurity in which they had been living and working and, in the fall of 1945, there was held in a Parisian gallery a comprehensive showing of the work of such well-known artists as J. P. V. Beurdeley, J. Boullaire, J. Frélaut, P. Guastalla, A. Jacquemin and J. Villon. The first large group of contemporary French etchings to reach the outside world was taken to the United States at about the same time; it was shown by invitation in the Thirtieth Annual Exhibition of the Society of American Etchers, and included prints by H. G. Adams, Y. Alix, E. Cournault, J. Deville, A. Gross, J. Hecht and C. Walch. These artists were members of "La Jeune Gravure Contemporaine," under the presidency of J. Hecht.

After the 18th century etching steadily declined in Italy and from the beginning of the 19th until the entrance of that country into World War II little of significance was done in this field, although A. Carbonati, E. Mazzoni-Zarini and F. Mauroner produced prints which, in their honesty of conception and competence of execution, preserved what remained of the great tradition of Italian etching. During and after World War II nothing came from that strife-torn land. The enforced discontinuance of the biennial exposition at Venice denied to the outside world knowledge of all art production within.

Nor was the decade 1937-46 eventful as far as Spanish etching was concerned; in fact nothing of importance had been done there since the sparkling prints of the 19th century master, M. Fortuny. Such incursions into the field of etching as were made by P. Picasso were to be identified rather with France than with the land of his birth. During the years 1937 and 1938 a few prints came from the hands of J. Komjati, Hungarian master resident in Budapest, and a number of his fellow countrymen of lesser note produced work, but no etching of national note. The same was true of Poland, Czechoslovakia and the Scandinavian countries, although considerable work of great competence, if not distinction, was executed in Sweden both immediately preceding and during the war. Russian graphic artists concentrated their attention for the most part on the relief process of woodcut.

The last etchers of prominence to work in the Netherlands and Belgium in the early decades of the 20th century were M. A. J. Bauer, C. S. van 'sGravesande, J. Israels, M. Maris, J. Poortenar and W. Witsen, after whom the little that was done was under the yoke of nazi Germany and did not reach outside the immediate confines of its production. In the last-named country original etching died with M. Liebermann and K. Kollwitz, the latter one of the great graphic artists of all time and sharing, with Mary Cassatt, pre-eminence among women in the field of etching. P. Halm, M. Klinger and H. Wolff carried on in a lesser way, but creative art was doomed from the first under nazi rule and the period under discussion was completely barren except for such of the work of the artists mentioned as survived. Until individual freedom

of thought and action returned to all countries contaminated and enslaved by nazi and fascist influence there could be no original and vital form of art expression.

Latin America.—Throughout the decade 1937–46, Latin-American art flourished, encouraged by the closer integration of the countries of the western hemisphere, particularly with the United States. In the latter country the Inter-American Office of the National, Gallery of Art was active in stimulating mutual exchanges, as was also the American National Committee of Engraving. Etching never flourished south of the Rio Grande, however, the woodcut and the lithograph having been the most popular graphic media. Some work on copper was done, nevertheless, by artists in Mexico, Uruguay, Argentina and Venezuela, though it bore much more the stamp of foreign influence and much less of the native verve displayed by the other media, particularly wood.

British Empire.—Canada and Australia, on the other hand, produced much etching of real interest and vitality in spite of the limitations and exigencies of wartime demands. From 1937 to the conclusion of the war, the principal print society of the former, the Society of Canadian Painter-Etchers and Engravers carried on with little diminished activity under the stress of circumstances and the pressure of hostilities. Among consistent producers and exhibitors in Canada were W. K. Aykroyd, J. J. Barry, I. Cleland, W. F. G. Godfrey, N. Hornyansky, J. S. Inglehart, W. P. Lawson, I. Mackinnon-Pearson, H. D. Martin, W. K. Peacock, O. Staples, F. B. Taylor, C. J. Travers, H. D. Wallace, P. Whalley and W. J. Wood, covering most of the better-known graphic media. So, also, elsewhere, the Printmakers Society of Honolulu held annual exhibitions through the war.

It is worthy of note that, in spite of the conditions of unrest that prevailed in India, the veteran Mukul Dey, leading exponent of the etcher's art there, published new prints.

Great Britain.—With the ending of the 19th century, the great period of French etching, and the beginning of the 20th, the centre of activity in the medium was transferred to England and, later and increasingly, to the United States.

During the ten years 1937 to 1946, it is a safe generalization to say that the greatest number of outstanding etchers belonged to the two great English-speaking countries, and by far the greatest number of prints with any claim to survival as works of art of enduring beauty and significance were produced by them.

It is a tribute to the morale and high courage of the British artist that, in a country fighting literally for its very existence and with its manpower exhausted by the demands of the most exacting and terrible conflict in world history, he was able somehow to keep alive and even create a very considerable volume of art, and that his production was, considering the almost impossible conditions under which it came into being, of a surprisingly high order of merit. Throughout those chaotic years the Royal Academy and the Royal Society of Painter-Etchers and Engravers, the two leading agencies for the display of etchings to the British public, held their exhibitions, attracted large crowds, and distributed many prints. Print galleries, bombed out of their old locations, with members of their staffs killed or wounded and their stock depleted, opened in others. By far the greatest contribution of British etching to the history of this ancient and honourable art during the ten eventful years beginning in 1937, and by far the greatest contribution that could be made to it in any land, by any people,

was the undying proof to the world that art, as represented by the production and appreciation of pictures conceived with sincere spiritual feeling and executed with a high degree of technical skill, is a necessity and not a luxury in human life, even when that life is threatened with extinction.

At the time this period opened, four of the modern masters of etching were living and working in the British Isles, albeit the oldest of the four, Sir David Young Cameron, was comparatively inactive due to advanced age. The other three, Sir Muirhead Bone, James McBey and Frederick L. M. Griggs, were still in their full powers. Sir Muirhead Bone is included in the group by virtue of the close relation between dry-point, the medium he made so completely his own, and the acid bitten line which is, in the strictest sense of the word, the true etcher's medium. During the decade, Cameron and Griggs died, leaving behind them in their prints rich legacies of beauty and inspiration for artists and laymen alike. Few modern etchers had approached them in the nobility of their conceptions, the wealth of their imagination or the perfection of their execution.

Two other noteworthy figures in British etching, and therefore in all contemporary graphic art, were also lost through death during the period-Sir Frank Short and Arthur Briscoe. The former, a distinguished etcher, a great mezzotint engraver and probably the most versatile and accomplished technician in the fine print media of modern times, was for many years president of England's leading print society, the Royal Society of Painter-Etchers and Engravers, succeeding the founder and first president, Sir Francis Seymour Haden, and as such and by his teaching at the Royal College of Art, exercised a more far-reaching influence on the direction of the art of etching in England in modern times than any other man. Briscoe, who had been a professional sailor in his earlier years, took up etching comparatively late in life at the instigation of James McBey and, by reason of his years before the mast, his intimate personal knowledge of the sea and of sailing ships and his great natural abilities as a draughtsman, became the leading marine etcher of his day, with the American, Charles H. Woodbury, as his only rival. He died in 1943.

From the outbreak of World War II, Sir Muirhead Bone placed his great powers as a draughtsman, particularly in the interpretation of structural subjects, and his unrivalled skill as a master of dry-point at the disposal of his government and spent the period of the war, as he had during World War I, making drawings of its stupendous effort both in the military and industrial fields. The products of his needle were not made public during the wartime years.

This period marked the full flowering of another modern British master of etching, Gerald Brockhurst, whose personal and individual renditions in the field of portraiture, executed in a minute and flawless technique in which, however, breadth of feeling was never lost, entitled him to a high rank among all British portraitists. He eventually transferred his citizenship to the United States where in 1946 he was living and working in New York city. Shortly before that time James McBey had done the same thing so that of the foremost etchers in England at the beginning of the decade, Sir Muirhead Bone alone remained there in 1946. To fill the great gaps left by their demise or transfer to other lands, however, other outstanding figures remained or had arisen. Conspicuous

among these were H. G. Rushbury (the bulk of whose work was in dry-point) in the field of architectural interpretation and F. Dodd in portraiture, both sensitive artists and technicians of the first order. Other prominent etchers and regular exhibitors were S. Anderson and G. Wedgwood, both working increasingly with the burin, W. W. Austen, K. Cameron, W. D. B. Davis, P. D. Drury, W. R. Flint, H. A. Freeth, S. Gosse, M. Hardie, S. Lee, W. W. Manning, J. Nicholson, M. Osborne (president of the Royal Society of Painter-Etchers, succeeding Sir Frank Short), W. P. Robins, S. Sproule, L. Squirrel, I. Strang, R. Tanner, E. Taylor, S. van Abbe and W. Washington, the last-named equally identified with line engraving. The veteran E. Blampied continued to produce fine etchings at intervals, though turning more and more to the medium of lithography.

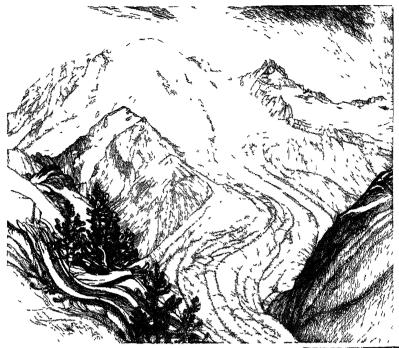

Thus we see that with its great tradition of craftsmanship and the dual advantage of the best schools and most accomplished professional plate printers in the world, English etching carried on through the ten eventful years with remarkable success, in spite of almost insuperable difficulties. Always adhering to traditionalism and little affected by external influences, it found few supporters among the exponents of the so-called modern movement in art. If this reactionary attitude toward contemporary feeling sometimes resulted in a certain sterility and repetitive quality, it nevertheless tended to preserve and strengthen the basic standards, both of feeling and craftsmanship, that have governed the greatest exponents of the art of all periods and all lands, and served to conserve and hand on to future generations the highest traditions of the art as established by the masters of the 16th and 17th centuries.

United States.—With the outbreak of World War II, what we may roughly term the second period of American etching came to a close. The significant beginnings had been in the hands of O. H. Bacher, R. F. Blum, F. Duveneck, R. S. Gifford, the three Morans (Peter, Thomas and Mary Nimmo), S. Parrish, C. A. Platt, J. D Smillie, Dr. L. M. Yale and J. A. McN. Whistler. Of these, Duveneck was a real master and Whistler, though his life and work were identified with England, France, Italy and Holland, rather than with the United States, was one of the supreme etchers of all time. These pioneers had been succeeded, and their art ably carried on, by D. S. MacLaughlan, C. F. W. Mielatz, J. Pennell, A. Sterner, C. Washburn and H. A. Webster, and by F. W. Benson, G. E. Burr, S. Chamberlain, H. N. Cook, A. B. Davies, K. Eby, S. Gallagher, A. C. Hansen, E. Haskell, F. C. Hassam, A. W. Heintzelman, E. Higgins, A. Landeck, A. A. Lewis, M. Lewis, R. Partridge, E. D. Roth, C. F. Ryder, H. Wickey, J. W. Winkler, F. T. Wood, C. H. Woodbury, G. H. Wright and M. M. Young. Among these names were to be found those of all the modern masters of American etching, of whom a considerable number were still producing work when the period opened. Some, as Chamberlain (returned from distinguished military service overseas), Eby, Heintzelman, Higgins, M. Lewis and Roth, were still doing so at the close of the period. Many other etchers were active, their work representing various tendencies and schools of thought from the most traditional to the most abstract, covering every field of subject matter, and stimulated by the ever-increasing public interest in the art as evidenced by the steadily augmented number of print exhibitions, galleries and societies. So great was the response of American artists at this time, in spite of the demands made by war, to the appeal of etching as a medium of original graphic expression, that to enumerate all the serious workers in the medium would be to exceed the confines of this article. The following were, however, most in evidence: N. Y. Andersen, J. G. Bettelheim, I. Bishop, L. S. Bobleter, H. Botts, C. Botke, P. Cadmus, the accomplished lithographer F. Castellon, J. E. Costigan, L. C. Daniel, R. Fabri, I. Friedlander, S. Fuller, D. W. Gorsline, G. Grant, E. M. Grossman, I. D. Hoffman, I. Hugo, the veteran A. H. Hutty, G. Kloss, L. Kupferman, H. A. Loggie, L. Lucioni, J. Margulies, B. McVeigh, H. Miller, A. Ostrowsky, M. Petersen, F. Rocker, W. Sharp, E. H. Sherman, R. H. Weidenaar and K. S. Williams. Also risen to positions of prominence in American etching were S. Csoka and C. M. Schultheiss, the latter equally accomplished as a line engraver, while S. W. Hayter and his students and followers of Atelier 17 which he had brought from Europe produced many etched designs of great beauty in the so-called abstract idiom.

Looking back on the years detailed by this article, it may be said that the influence of etching as an independent creative art increased and spread rapidly throughout the United States. Its growth was fostered by the regular annual and travelling exhibitions of the three principal professional print societies, the Society of American Etchers in the east, the Chicago Society of Etchers in the middle west and the Printmakers Society of California in the far west, as well as by numerous other smaller ones all over the country; by the print exhibitions sponsored by the National Academy of Design and the American National Committee of Engraving; by the comprehensive annual showing of prints at the Library of Congress in Washington under the aegis of the Pennell Fund committee; and by the activities of the Work Projects administration while it was in existence. On Dec. 7, 1942, the first anniversary of Pearl Harbor, the Metropolitan Museum of Art in New York city opened its doors on the largest and most comprehensive exhibition of prints ever held in the United States, under the auspices of Artists for Victory, a national association established at the outset of the war to place at the disposal of the government the services of the artists of the country. This exhibition numbered 578 works by 414 artists, representing nearly every state in the union and including the District of Columbia and Hawaii. The same organization brought together in 1943 a small but representative exhibition of contemporary American fine prints to send to England in exchange for a similar British group sent to the United States in 1944 under the aegis of the Central Institute of Arts and Design. An encouraging feature in the growth and development of art in general in the United States, and therefore, specifically, of etching, was the fostering of closer relationship and understanding between art and industry. Each had much to give the other and it was to the vision and broadmindedness of such men as Thomas J. Watson, president of the International Business Machines corporation, and Francis Henry Taylor, director of the Metropolitan museum, that the encouragement of such a union was due.

Lastly, in connection with etching in the United States, it may fairly be stated that in the decade reviewed a distinct and characteristic national school became established. With every phase of human life represented, with boundless resources of natural beauty and inspiration at hand, and with the mixture of races and traditions in the

¹The author modestly refrains from including his own name in this or the following listing. [EDITOR]

Above: Copper etching by Roi Partridge entitled "Glacier" (Mt. Rainier, Wash.)

Upper right: "Lancaster County Farmer," a dry point by Arthur W. Heintzelman

Above: "Romanian Gypsy with Child," etching by Carl M. Schultheiss

Left: "The King Goblin," etching by Helen A. Loggie

population, it was natural that the art of the nation and, because it is the most democratic of all forms, the art of the printmaker, should partake of all tendencies, all classes of subject matter, all means of expression, welded together into one related whole and nourished and quickened by the vitality and energy of a young nation. If the blending was not complete in 1946, it was far more so than in 1937. As proof it may be pointed out that instead of the great number of refugee artists who travelled to the United States from all over the world, imposing their ideas and their techniques on American art, they became speedily absorbed into it.

* * *

GENERALLY, the decade saw an increase of practitioners of the ancient and beautiful art of etching, with a corresponding enlargement of interest on the part of the general public, in spite of the fact that for practically the entire period the civilized world was plunged in the most terrible war in human history.

(J. T. Ar.)

Ethical Culture Movement

A religious and educational movement emphasizing the centrality of ethics in human relations, the Ethical Culture movement was started in New York city in 1876 by Felix Adler, and was established ten years later in London by Stanton Coit. In 1946, societies were active in New York city, Westchester, Brooklyn, Philadelphia, St. Louis and Chicago, and groups were meeting regularly in Washington, D.C., South Orange, N.J. and Los Angeles. There were four societies meeting in London (one conducted in the French language) and one in Birmingham, England. Contact had been re-established with the remaining members of the Vienna society which, as was the case with the Berlin group, had been suppressed by the nazis.

The Ethical Culture societies conduct Sunday and week-day services and a variety of educational and community activities. University Settlement, the first neighbourhood house in the United States, was an enterprise of the movement, which was also responsible for significant efforts in child labour reform, visiting nurse associations, legal aid societies, housing, race relations, child study and progressive education. Considerable literature dealing with the autonomy of ethics and the religious nature of ethical dedication was produced.

From 1937 until the beginning of World War II, U.S. and English societies alike were deeply concerned with assistance to refugees from nazidom. Special attention was given, in conjunction with instruction in English and through comprehensive series of lectures, to familiarizing individuals with the new cultures in which they found themselves. In this same period, contributions to the democratic orientation of the developing work-camp idea were made through the establishment of Associated Junior Work Camps and Work Camps for America. Throughout the war period, in addition to service activities, the Ethical Culture societies devoted themselves to extensive programs of adult education, spearheaded by the creation of the John L. Elliott Institute in New York. They were also actively concerned with fuller realization of Negro rights, problems of atomic power and public policy and improvement of the public school system. The Conference on the Scientific Spirit and Democratic Faith, founded in 1943 under the honorary chairmanship of John Dewey, held its annual sessions at the meeting house of the New York society. The movement celebrated its 70th anniversary

with a series of conferences on educational, labour-management and international problems. The observance culminated in the creation of the first Encampment for Citizenship, drawing together from all parts of the United States young people of diverse backgrounds who during the summer of 1946 lived and studied together on the campus of the Ethical Culture schools in New York.

George E. O'Dell continued as secretary of the American Ethical union but was succeeded in 1946 by Ralph Toledano as editor of *The Standard*, published each month at 2 West 64th Street, New York, 23, N.Y. The American Ethical union, of which Robert D. Kohn was president, had offices at the same address. The offices of the English Ethical union, of which John Laird was president and H. J. Blackham executive secretary, were at 4A Inverness Terrace, London W2.

BIBLIOGRAPHY.—Exposition of the movement's principles was to be found in Felix Adler's An Ethical Philosophy of Life. Among publications by various leaders after 1937 were: Ethical Religion: Its Basis and Possibilities (a symposium); Horace J Bridges, Humanity on Trial and Some Applications of Ethical Religion; W. Edwin Collier, Phases of Ethical Fath; A Eustace Haydon, Biography of the Gods; David Saville Muzzey, Ethical Religion and Ethical Imperatives; Jerome Nathanson, Forerunners of Freedom; and V. T. Thayer, American Education under Fire. (J. NN.)

Ethiopia

An ancient empire of northeast Africa, Ethiopia is bounded north by Italian Eritrea, west by the Anglo-Egyptian Sudan, south by Kenya, southeast by Italian Somaliland and east by British and French Somaliland. Area: c. 429,845 sq.mi.; pop. (Italian est. 1939) 9,450,000; (Ethiopian est. 1946) 15,500,000. After their conquest of Ethiopia in 1936, the Italians estimated that about onequarter of the population were Ethiopians or Amhara and about half were Galla. Chief towns: Addis Ababa (cap., 1946 est., 300,000); Diredawa (1938 est., 30,000); Harar (25,000); Gondar (22,000). Languages: Gueze or Ethiopic, obsolete except in liturgy; Amharic, the official language; also Tigrinya, Tigre, Galla and Somali. Religion: Christian (Copt) and Mohammedan. Ruler: Emperor Haile Selassie I; prime minister: Betwodad Makonnen Endalkatchaw (appointed May 1941).

Exile.—Ethiopia was advancing rapidly in civic progress when the Italians invaded the country, without provocation, on Oct. 3, 1935. The condemnation by the League of Nations voted by 52 member states, and subsequent sanctions, proved no deterrent. The Italians massed powerful forces in their colonies, Eritrea and Italian Somaliland. By lavish use of poison gas they gained victory and succeeded in entering Addis Ababa, on May 5, 1936. The Emperor Haile Selassie I, his family and ministers had already left the capital on May 3 for Jibuti, where they were embarked on a British warship. The emperor, in a moving speech, placed Ethiopia's case before the League of Nations. During the following years he kept its cause before the world public opinion by every means in his power. Resistance in Ethiopia was continued by patriot forces. On Feb. 19-21, 1937, by order of Marshal Rodolfo Graziani, the Italian governor, about 30,000 people were massacred in Addis Ababa, and also large numbers in other towns. By 1938 most European governments had recognized the Italian conquest, but the patriots continued their resistance.

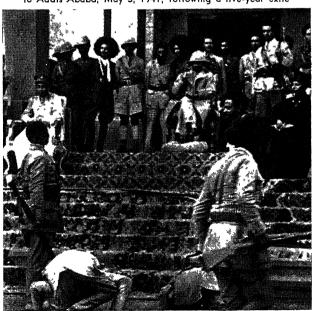

Liberation.—When Benito Mussolini entered World War II on June 10, 1940, the patriots were active throughout Ethiopia, having equipped themselves with captured Italian arms. The emperor immediately approached the British

government, requesting facilities to fight for the liberation of his people, and offering full co-operation in the war. The British government arranged for the emperor, his sons and ministers to be flown to Egypt. In consultation with the British military authorities there, the emperor issued from Khartoum a proclamation to the Ethiopian people, and to their brothers in the Italian colonies, announcing his intended return to effect their liberation with British aid. This proclamation, distributed by the R.A.F. in Aug. 1940, was joyously received in Ethiopia. Patriots immediately made their way across the frontier to convey to the emperor enthusiastic welcome and support.

On Aug. 12, 1940, the Anglo-Ethiopian noncombatant mission 101, headed by Brigadier D. A. Sandford, secretly entered Ethiopia to make contact with the patriot forces there. Brigadier Orde Charles Wingate was appointed to serve under the emperor, as commander in chief of an army of liberation, appropriately designated "Gideon Force," consisting of 1,000 Ethiopians, 1,000 Sudanese troops and 100 British officers. This small force, slenderly armed, and without air cover, crossed the frontier on Jan. 19, 1941, and vanquished, with the aid of the local patriot guerrillas, 40,000 heavily-equipped Italians entrenched in the mountains of the Gojjam. Debra Markos was entered on April 5 by the emperor and his force. In the north, Eritrea had fallen to Lt. Gen. Sir William Platt and his army from the Sudan, while from the southeast a third attack was directed by Gen. Sir Alan Cunningham against Italian Somaliland. Gen. Cunningham's army liberated Addis Ababa on April 6. On May 5, after exactly five years of Italian occupation, the emperor re-entered his capital amid overwhelming enthusiasm.

After the victory, as a result of the *de jure* recognition of the Italian conquest by Great Britain, Ethiopia was officially administered as occupied axis territory until the Anglo-Ethiopian agreement of Jan. 31, 1942. This agreement left the one railway—Jibuti-Addis Ababa—and about one-third of Ethiopia, the sparsely populated Ogaden and so-called "reserved area" still under British military administration, though without surrender of Ethiopian sovereignty. The agreement of Dec. 19, 1944, slightly reduced the area under British administration, restored the

Haile Selassie receiving the homage of his subjects on his return to Addis Ababa, May 5, 1941, following a five-year exile

important railway town, Dire Dawa, to Ethiopian government and made possible the return of the railway to the Franco-Ethiopian company.

Reconstruction.—The legal code was reformed to accord with modern humanitarian principles, in consultation with British jurists; old customs, such as adjudication by the passer-by, were abolished; no one could officiate in any court who had not prescribed qualifications of education and experience. Full-time salaried, uniformed, trained military and police forces, under the ministries of war and public security, replaced former citizen levies and local guards. The imperial guard and imperial Ethiopian army were trained by a British military mission.

In 1945 a new Ethiopian dollar currency (Eth. \$10 = £1\$ sterling) replaced the old Maria Theresa silver dollar, and the East African shilling used since the liberation. Land survey and registration were proceeding; a new land act abolished all former dues and charges in cash, produce and labour, and substituted a single tax, payable on all land, used or unused, and scaled for fertile, semifertile and poor land. This opened a new era of prosperity for the hard-working peasant. Tax on church lands was paid to the ecclesiastical fund for church and school purposes.

Transport was a major problem owing to the extent of the country and its precipitous ascents. The establishment in 1946 of National Ethiopian Airlines, foreign air lines calling at Addis Ababa, development of motor transport and garages able to repair and condition cars and better upkeep of roads were of great help. Lack of access to the sea remained a serious handicap.

The remnants of feudalism were liquidated with the abolition of the legal status of slavery in 1942. The authority and responsibility of parliament were increased; the franchise was extended, vote by ballot was introduced in 1945, and local government was reorganized.

International Affairs.—Ethiopia joined the United Nations on its inception and its subsidiary organizations as they were formed, being represented at all conferences of these bodies. Though still suffering the effects of invasion, Ethiopia paid its dues to United Nations Relief and Rehabilitation Administration, made additional gifts in cash and produce to other war sufferers, and gave hospitality to Greek refugees. At the Paris peace conference (July-Oct. 1946) the Ethiopian delegation claimed the restoration to the Ethiopian empire of the Italian colonies, Eritrea and Italian Somaliland, and presented a memorandum embodying the Ethiopian government plan for the administration of Eritrea. An Eritrea-Ethiopia Unity association, and a similar one for Italian Somaliland, were formed by refugees from those territories in Ethiopia. These organizations held demonstrations and sent telegrams to the council of foreign ministers. The Ethiopian church in 1946 obtained by negotiation with the parent church in Alexandria self-government and the right to elect its own patriarch (His Beatitude Etcheguie Gabze Gozguis) and (E. S. Pt.) to establish an ecclesiastic college.

Post-Liberation Reform.—The date of the emperor's return (May 5, 1941) marked the beginning of a period of reforms and modernization. In the early years following the proclamation of Ras Tafari, later Emperor Haile Selassie I, as heir to the throne and ruler of the empire, he could pursue his modernization plans only slowly, careful not to offend the venerable customs in the framework of which ancient Ethiopia had developed. However, the restoration of 1941 allowed the emperor to proceed with a bold modernization program that otherwise would have

been considered imprudent and impossible to realize. The constitution which, in 1931, he had granted voluntarily to the nation served as point of departure for his radical reforms which completely changed the almost mediaeval structure of the country within the span of a few years to a highly modernized state based on democratic principles. This development was possible under an imperial government thanks to the creation of the necessary institutions, an administration comparable to those of advanced countries and, particularly, the personal action of an enlightened sovereign. The emperor understood the singular importance of public instruction and public health and realized that Ethiopia's true independence and sovereignty could only be assured on these indestructible foundations. Public instruction, therefore, had a foremost place in the emperor's program and after 1941, its administration was under the personal leadership of the monarch. At the same time, public hygiene was stressed, and the emperor's reform plans envisaged, even in the face of adverse material conditions created by the war, the maintenance of already existing hospitals, the creation of new ones and the development of a modern system of health services acces-(H. SE.) sible to all.

European Advisory Commission

One of the principal decisions of the Moscow conference of Oct. 1943 was to set up a European Advisory commission to work on the principal political problems arising from the termination of the war in Europe. This commission met first on Dec. 15, 1943, in London. Until its termination in the summer of 1945, the commission met more than 100 times, formally and informally. It dealt primarily with problems arising from the surrender of the axis countries in Europe. Most of its work related to Germany and Austria, although it was also active in negotiating the surrender terms subsequently applied to Bulgaria and Rumania. In Nov. 1944 the three original members, the United States, Great Britain and the U.S.S.R., invited France to join the commission.

The commission was composed of four representatives, one appointed by each government. They were, for the United States, Ambassador John G. Winant; for the U.S.S.R., Ambassador Foydor Gousev; for Great Britain, Sir William Strang; for France, Ambassador Rene Massigli. The representatives had the assistance of political, military and other advisers, and of a joint secretariat.

The commission, designed to be a recommending body, was in practice a negotiating organ. Its discussions were conducted and decisions reached on the basis of detailed instructions from the four governments. Actual discussions were limited to specific arrangements for dealing with the defeated axis states, although numerous draft directives were submitted by the British and United States delegations covering a broad range of problems never dealt with formally. Circulation of draft directives facilitated exchange of views and prepared the way for the actual negotiation of these matters later undertaken by the Control council for Germany and the Allied Control commission for Austria.

The chief task of the commission was the negotiation of surrender terms to be imposed upon Germany in accordance with the Casablanca formula of unconditional surrender. The agreed instrument was recommended by the commission in July 1944, and accepted by the three member governments. After the surrender of May 8, 1945, the commission rewrote the instrument as a declaration to provide for joint Allied action in imposing basic military requirements in Germany. This was signed and issued at Berlin by the four commanders-in-chief on June 5, 1945. Later, certain additional requirements, broadening the imposed terms to political and economic matters, were agreed upon by the commission and accepted by the four governments.

Another major task was the negotiation of agreements defining the three zones of occupation in Germany and the areas of occupation in Berlin (Sept. 12 and Nov. 14, 1944). At Yalta it was decided to assign the French a zone and the commission proceeded to define such an area.

The commission also worked out basic plans for the machinery of joint control of Germany. The agreement of Nov. 14, 1944, became the basis for planning the control machinery and putting it into operation in the summer of 1945. An additional agreement of May 1, 1945, provided for French participation. Plans for Allied control machinery and zones of occupation in Austria were embodied in agreements signed in July 1945.

The commission was supplanted as a planning and coordinating agency by the Allied Control council for Germany and the Allied Control commission for Austria (qq.v.) in the summer of 1945. The four governments, in accord with the Potsdam declaration (Aug. 1945) recommending

its dissolution, agreed to consider the Commission as terminated in Aug. 1945. (See also Allied Control Commission for Germany; Allied Military Government; International Conferences, Allied [World War II].)

Evangelicals, National Association of

At a constitutional convention held in Chicago, Ill., in May 1943, and attended by approximately 500 executives and leaders of 63 Protestant denominations, the National Association of Evangelicals was formed to provide a means of co-operation in fields of common interest. Its membership, as of late 1946, consisted of 25 denominations, approximately 300 single churches of other denominations and a considerable number of educational institutions and mission boards.

Its operations were carried on largely through 11 affiliated corporations and commissions including Evangelical Foreign Missions association, National Religious Broadcasters, National Sunday School association, Chaplaincy Counsellors for Industry, Evangelical Youth, Commission for Evangelism, Commission for War Relief, Commission for Christian Educational Institutions, Commission for Church Schools, Commission for Home Missions and Commission for Chaplaincies.

Its doctrinal position was strongly conservative. The official organ, United Evangelical Action, was published semi-monthly at 903 St. Paul Building, 111 E. Fourth Street, Cincinnati, O. Regional and departmental offices were maintained in New York city; Newark, N.J.; Washington, D.C.; Buffalo, N.Y.; Detroit, Mich.; Cincinnati, O.; Chicago, Ill.; Minneapolis, Minn.; Los Angeles, Calif.; Portland, Ore.; and Boston, Mass. The national office was located at 120 Tremont St., Boston, Mass.

Officers in 1946 were Dr. R. L. Decker, of Kansas City, Mo., president; Dr. Stephen W. Paine, of Houghton, N.Y., first vice-president; Dr. William H. Rutgers of Grand Rapids, Mich., second vice-president; Seth A. Rohrer, of Elkhart, Ind., secretary; H. J. Taylor of Chicago, Ill., treasurer. Dr. J. Elwin Wright continued as executive secretary. Its work between general meetings was administered by an Executive committee of 11 members and a Board of Administration of 48 members. (J. E. WT.)

Evatt, Herbert Vere

Evatt, (1894—), Australian statesman, was born April 30, 1894, in East Maitland, New South Wales, the son of a storekeeper. He studied at St. Andrew's college and won his degree as doctor of philosophy from Sydney university in 1924. He practised law in New South Wales, and at the age of 36 was named justice of the federal high court of Australia—the youngest man ever appointed to that high post. After ten years of service on the high court he left in 1940 to enter politics. Running on the Labour party ticket he was elected to the Australian parliament (1940) and after John Curtin became premier in Oct. 1941 he appointed Evatt attorney general and minister of external affairs. Evatt broke away from what was

loosely termed as a "British-influenced" policy and evolved a vigourous and independent Australian policy, although he bent it to fit within the framework of the empire.

After the start of World War II Evatt insisted on Australia's right to sit in the Pacific War council as a coequal with Britain and the United States. With regard to Allied policy on Japan, Evatt criticized the British government on Aug. 24, 1945, charging that London had attempted to deny Australia a footing of equality in the Japanese peace discussions. He said his government had countered this action by direct dealings with Gen. MacArthur and obtained authority for Australia to have Gen. Thomas Blamey be its representative at the Japanese surrender ceremonies.

He was his country's delegate to the United Nations conference in San Francisco and soon established himself as the champion of the small "voiceless powers" tilting against the veto. On May 3, 1945, he told the U.N. that a great error had been made in employment of the veto and suggested several amendments to restrict it. While not permitted to sit in the Allied council of foreign ministers in London (Sept.-Oct. 1945), he did wage a sustained battle from the side lines for the rights of small nations to have a voice in drafting the peace treaties. He also attended in 1946 the major conferences of the U.N. in New York and the 21-nation peace conference in Paris, at which he continued his campaign against the veto.

Exchange Control and Exchange Rates

At no time during the whole interwar period (1918-39) did a really balanced world economy exist; this fact was obviously reflected in the international currency situation. The pre-1914 gold standard was destroyed, and the position of the pound sterling, around which the international gold standard had been centred, was weakened as a result of World War I. Immediately after the end of that war, attempts were made to stabilize currencies and to re-establish the gold standard. Such was the objective of the recommendations of the Brussels conference in 1920 and of the conference in Genoa in 1921. Also, the financial committee of the League of Nations supported this policy and was helpful in promoting currency stabilization, especially in central and eastern Europe. When the World Economic conference met in Genoa in 1927, it declared that the main task in the field of monetary reconstruction had been achieved, because most countries had stabilized their currencies in terms of gold.

Shortly afterward the events showed that this monetary stability was not based on a balanced state of the world economic situation. The decline of prices of agricultural products and raw materials in the years 1928 and 1929 rendered the position of the balance of payments of a number of primary producing countries difficult, especially if they had substantial foreign debts, the burden of which increased automatically with declining prices of their staple exports. Thus the Latin-American countries, Australia and New Zealand were hit first, and shortly afterward the Danubian countries.

Already in 1929 the currencies of the following countries were depreciated: Uruguay in April, China in September,

Japan in October, Argentina and Paraguay in November and Brazil in December. In 1930 came the depreciation of the currencies of Bolivia and Australia (in Australia the official suspension of the gold standard was already declared in Dec. 1929) in March, and of Venezuela and New Zealand in April.

But only the Wall street crash in 1929, followed by a deep economic crisis in the U.S., and the resulting cessation of practically all foreign lending of the U.S. brought to the fore the realization of the fact that the whole world economy was shaken. The gravity of the monetary crisis shifted to Great Britain and to central Europe. The international monetary system, which many people thought to have been re-established, began to disintegrate, and soon several monetary systems or blocs began to emerge.

Sterling Area.—Under the extremely heavy pressure on its balance of payments, Great Britain decided to suspend the gold standard on Sept. 21, 1931. The pound began to depreciate rapidly; currencies of a number of countries which regarded the British market as the most important for them followed the movements of the British pound. Denmark suspended the gold standard on Sept. 29, 1931; Norway and Sweden on Sept. 28, 1931; Egypt, Palestine, India and Ireland in Sept. 1931; Finland on Oct. 12, 1931; Canada on Oct. 19, 1931; Portugal in Oct. 1931; Japan in Dec. 1931; and finally the Union of South Africa in Dec. 1932.

Subsequently the pound of sterling was not again stabilized in terms of gold, although its relation to the dollar remained fairly stable from 1934 on. Yet certain other nations which had abandoned the gold standard after Great Britain (Australia and New Zealand had preceded), then fixed the external values of their currencies in terms of sterling. These were countries which kept important parts of their central bank reserves in the form of sterling rather than in gold or foreign exchange of other kinds. This group of nations, including Britain, became known as the sterling area. It had both British and non-British members. With the exception of Canada and Newfoundland the entire British commonwealth was included. Certain non-British nations, Portugal, Egypt and Iraq, became members immediately. Siam joined in 1932, Sweden, Norway, Denmark, Finland and Estonia in 1933, and Iran and Latvia in 1936. The basic economic reason underlying both the choice of sterling as a suitable asset to hold a part of their official reserve, and the decision to follow Britain in a policy of depreciation after 1931 was the fact that all sterling area nations were already doing a very high proportion of their trade with each other and particularly with Great Britain. Several countries, such as Argentina and Japan, kept their currencies stable in terms of sterling for many years without, however, keeping appreciable reserves in sterling; these countries were generally not regarded as members of the sterling area.

The sterling area was the result of decisions by the individual nations, not of any special agreements. The nations concerned did not attempt to keep their monetary policies completely in accord with one another, and there were several changes in exchange rates, for example by New Zealand and Denmark. These steps were taken by the respective nations without any reference to Great Britain. There was no pooling of dollars and no exchange control in Great Britain.

Nevertheless, the sterling area became an important factor in the international monetary policy, and its existence undoubtedly strengthened the position of the sterling.

Furthermore, "the sterling bloc" appeared to have a general stabilizing influence. Most of the members of the sterling area were able to maintain a free exchange market without exchange control nearly until the outbreak of World War II. Exchange control was introduced by Denmark, Latvia and Estonia.

The average value of the pound of sterling as percentage of its gold parity in 1929 was as follows: in 1932, 72; 1933, 68.1; 1934, 61.8; 1935, 59.8; 1936, 60.5; 1937, 60; 1938, 59.3.

It is interesting to compare this development with the exchange rate fluctuations of other currencies of the sterling area. Table I shows a large degree of exchange stability in the sterling area. This was achieved without foreign exchange control, which among the sterling area countries was only an exception.

The gold value of no currency in the sterling group depreciated less than that of the pound; the majority of the sterling countries pegged their currencies to the pound at a discount from the old parity.

Table I.—Value of Currencies of the Sterling Area as Percentage of Their Gold Parity in 1929*

*From League of Nations, International Currency Experience, 1944, p. 51.

Great Britain had chosen devaluation of the pound as the step toward restoring the maladjustment in its currency position and toward renewing the equilibrium of its balance of payments. At the beginning of this policy there were many who refused a stable exchange rate, believing that a flexible rate would be of better use in keeping a greater degree of stability of the British economy. But after a short time the advocates of foreign exchange stability won the upper hand.

Although the pound was not defined in terms of gold, the links to gold remained through the ratio to the dollar and, moreover, because a free gold market was maintained in London.

A free foreign exchange market continued to exist in London. The control of foreign capital issues imposed in 1931-32 was relaxed in the following years. Even non-British members of the sterling area needing to replenish their sterling reserves were able to obtain loans in London.

Adjusting the exchange rate to the falling level of prices—the increased value of gold—Great Britain and the members of the sterling area avoided to a substantial degree the acute deflationary crisis which befell the other countries. The share of the sterling area in world trade increased relatively in the '30s; the level of production in the entire bloc was better maintained, and the total recovery was quicker.

The gold reserve of the Bank of England went up from \$928,000,000 in 1933 to \$1,587,000,000 in 1938, to which \$448,000,000 held by the Exchange Equalization account should be added. The central gold reserve of other members of the sterling bloc increased from \$494,000,000 in 1932 to \$690,000,000 in 1938.

Countries with Exchange Control.—The heavy pressure on the balance of payments of Germany and the central and eastern European nations was instrumental in introducing foreign exchange control in this part of Europe. The profound disequilibrium in the balance of payments

of these countries was caused particularly by two factors: one was the sudden withdrawal of short-term foreign credits and the other the rapid contraction of international trade coupled with the decline of prices of primary products. With the exception of Czechoslovakia all nations in this area—Germany and Austria in the first line—had borrowed heavily from abroad on short terms but were not able to repay these credits when they were due or recalled. Some countries could not continue to service their long-term foreign loans. Moratoria on foreign long-term debts were declared in 1931–32 in Germany, Austria, Hungary, Bulgaria, Yugoslavia, Greece and Rumania; standstill agreements for short-term foreign debts were arranged for the German, Austrian and Hungarian banks.

Under the circumstances which prevailed at that time, there was hardly any chance of re-establishing the equilibrium of the balance of payments by devaluation of currencies of these countries. To Germans, as well as Austrians and Hungarians, who had gone through a galloping inflation only a few years before, devaluation was identical with inflation. The governments felt that they had to maintain stable currencies and stable exchange rates. And because it was not possible to maintain stable exchange rates in a free exchange market, foreign exchange control was introduced. Germany was first in deciding on this step in July 1931, followed closely by Austria, Hungary, Greece, Czechoslovakia, Yugoslavia and the Baltic states. Rumania introduced foreign exchange control in 1932, Italy in 1934 and Poland only in 1936. Turkey had foreign exchange control already after 1930 and Spain after 1981. Thus only a few years after the postwar foreign exchange controls were abandoned, a new system of exchange control was introduced throughout central and eastern Europe.

As was pointed out, the chief objective of exchange control was to attempt the maintenance of the exchange rate stability in spite of a very unfavourable development of the balance of payments. To achieve this goal, a quantitative exchange control was introduced, the governments trying to regulate directly the demand and supply of foreign exchange. While the exchange control in the immediate postwar period was directed mainly against speculation and exchange fluctuations caused by it, this time the objective was wider and more difficult to attain. It was considered a political necessity to hold the official rate of exchange. Since the rate of exchange could not be adjusted to help in reaching a new equilibrium in the balance of payments, the other alternative was to change the balance of payments by direct measures. Each country tried, therefore, to reduce demand and to increase supply of foreign exchange. The foreign exchange market was centrally controlled, and a system of permits and licences was introduced.

A licence was required for every remittance abroad. The foreign exchange authorities had the difficult task of allocating the available foreign exchange, and very often they had to proceed arbitrarily with no firm objective rules available. In these attempts to reduce the demand for foreign exchange, permits for so-called unnecessary payments were first refused, such as all capital export, granting of credits and travel expenditures; then transfer of foreign debts and even of interests and dividends was suspended. Finally the authorities considered it necessary to cut down the allocation of foreign exchange for the payment of imports. Germany, Austria, Hungary and several other countries allowed the goods to enter, but they allocated foreign exchange according to certain rules of priority, excluding payment for luxuries and granting for-

eign exchange for import of raw materials. Foreign suppliers of goods often were paid in blocked domestic currencies which were not freely transferable. Czechoslovakia, on the other hand, maintained a different principle; no imports were allowed for which payment abroad was not assured. Thus the creation of blocked accounts was largely avoided.

In order to increase the supply of foreign exchange, all exporters were obliged to surrender their proceeds in foreign exchange to the proper authorities at the official parity. The same applied to other income from abroad. As the foreign exchange situation deteriorated more and more, some countries—among them Germany and Czechoslovakia—required that all foreign holdings, in whatever form, belonging to their residents be registered. It is obvious that the surrender of foreign exchange was demanded, but in addition some foreign securities also had to be liquidated.

Foreign exchange control became a very elaborate apparatus, strongly interfering with the whole economic life. It is not surprising that this instrument, which had been introduced for reasons of currency stability, was used to foster foreign trade objectives, mostly increasing the strong protectionist policy of that time. The next step from exchange control led to foreign trade restrictions and from there to a broadly planned economy.

Yet in spite of the great emphasis laid on the maintenance of the original exchange rate and of all the intricacies of exchange control, most of the countries concerned were obliged to devaluate their currencies. Only Germany, Bulgaria and Poland maintained officially their pre-1931 rate until the outbreak of World War II. Thus Austria devaluated in 1934, Czechoslovakia in 1934 and again in 1936, Greece in 1932, Hungary in 1935 and 1936, Rumania in 1935, Yugoslavia in 1932 and Italy in 1936.

The official value of these currencies as percentage of their gold parity in 1929 was as follows:

	1933	1935	1938
Germany	99.6	100.3	100.1
Greece	43.3	42.9	40.8
Hungary	99.1	99.2	99.4
Italy	99	93	59
Rumania	98.6	89.8	72.3
Czechoslovakia	100.4	83.4	69.1
Yugoslavia	77-7	77	77.5

But we must judge not only by the official quotations of these currencies, which gave an impression of a rather large degree of stability; very soon a system of multiple exchange rates developed. Rumania, Bulgaria, Hungary and Yugoslavia, for example, paid a special premium—a higher rate—for all strong currencies obtained from export while they also sold at a higher rate foreign exchange for imports or other purposes. These premiums changed often according to countries or commodities, so that a simple system was replaced by a system of unstable multiple rates—a sign of a disintegrating currency system or of a comprehensive planning through the manipulation of exchange rates. Such premium was not introduced into Czechoslovakia and Austria.

Another source of multiple rates and even of a black market in foreign exchange was foreign blocked accounts. It is obvious that the foreign owners of these accounts tried to convert them in foreign exchange even at a high discount. In many cases some special use of these accounts was allowed, such as tourist traffic, emigrants' remittance, a new capital investment or a so-called additional export.

A regular quotation of such currencies was introduced, especially for various kinds of blocked marks.

According to quotations in Basel the value of blocked marks as percentage of their gold parity was as follows:

				Effecten-
Average	Register-	Reise-	Kredit-Sperr	Sperr
Rates	mark	mark	mark	mark
1935	56.3	65.6	37.3	28.2
1936	53	61.1	28.3	23.1
1938	46.5	58.4	13.4	11.8
1940	25.6	53.8	•	
1942	32.2	54.7	Handels	Sperr mark
			3	11.2
			1	10.6

The value of the blocked Lira as percentage of the 1936 parity was:

	Turistica	Reinvestimento	Mixto
in 1939	89	55	
1941	78	44	71
1942	74	30	64

The principal objective of the exchange control, avoidance of devaluation, was not and could not be attained. The exchange markets in a great part of Europe became very complex, regimented by authorities who vainly tried to stop the many kinds of circumvention of their measures. In addition to all other difficulties, exchange control was used as a convenient vehicle for foreign trade purposes, particularly for the German totalitarian trade policy. Although Germany was not the first country to substitute direct payment between trade partners by bilateral clearing payment arrangement, it worked out a system which was well-suited to its general aims.

The idea of bilateral clearing arrangements originated in Austria; there it was thought that it would be possible to overcome foreign exchange difficulties restricting trade by introducing payments in local currency into cumulative accounts owned usually by the central bank of the other country. And it was expected that trade would mutually expand, payments would be made over these accounts, and no great permanent balances would accrue. Some countries introduced such accounts even unilaterally as an action against a country which did not pay for its imports. Germany was not too eager, at first, to organize these clearing arrangements, because it had an export surplus with most of the countries concerned and was afraid that clearings would equalize the balance of trade. It became clear, however, that under the new circumstances the Danubian countries would not be able to pay import surplus from Germany in free foreign exchange. And when the German trade policy was reoriented in the autumn of 1933 as part of the general nazi policy, the system of clearings served as a good instrument for the German economic penetration into the Danube basin.

The technical mechanism of the clearing arrangements was simple. A fixed ratio between the currencies of the two countries was usually agreed upon. All payments between the two countries were effectuated in local currencies on the basis of the fixed ratio into the cumulative account belonging to the central bank or another authority of the receiving country. This system could operate smoothly so long as the payments on both sides were equal and so long as no permanent huge balances arose. If such balances did arise, trade could be slowed down. Experience with these bilateral clearing agreements showed that they led to equalizing of the balance of trade between a pair of countries.

It became Germany's policy to shift its imports of food and raw materials as much as possible to central and east-

ern Europe. The situation was very appropriate for such a step, since the Danubian countries, suffering under the impact of a heavy agricultural crisis, were looking for an outlet for their surpluses. Germany started a big buying drive, offering prices which in local currencies were often higher than prices obtainable on the world markets. It did not need to pay in foreign exchange because it arranged clearing agreements. It should be mentioned that in all these agreements the mark was put at its official value and was therefore mostly overvalued in relation to other currencies. This too made it easier to offer high prices. Germany's large purchases soon resulted in its developing import surpluses and consequently large debit balances on the clearing accounts with these countries. At the end of 1934 German debts in all clearing accounts already totalled mk. 450,000,000, the greater part owed to the countries of central and southeastern Europe. In March 1935 this debt reached mk. 567,000,000. The creditor countries soon accumulated larger sums on their clearing accounts with the German Reichsbank than they needed to pay for the current import of German industrial goods.

The only possibility of using these export proceeds was to increase imports from Germany, because the accounts were to be settled exclusively within the framework of bilateralism. In order to do that, the creditor nations had to switch imports from other countries to Germany and were compelled to buy goods of mediocre quality at high prices. Germany's import from the agricultural countries of southeastern Europe-Hungary, Yugoslavia, Rumania, Bulgaria and Greece-went from 3.8% of its total import in 1929 up to 10.5% in 1937, and it sent to them in 1937 9.4% of its total export as compared with only 4.3% in 1929. In 1937 Bulgaria exported to Germany 43.1% of its total export, Greece 31%, Hungary 24.1%, Yugoslavia 21.7% and Rumania 19.2%. Generally it was a substantial increase over the 1929 figures. The same applies of course to the imports of these countries from Germany.

With the help of bilateral payment agreements Germany built its economic hinterland in the Danube basin; the trade arrangements with it resulted in detaching this whole area step by step from the world economy.

The nations in central and eastern Europe did not have clearing agreements with Germany alone; their trade relations with each other were also organized on the clearing agreement basis. Czechoslovakia was the only country in this part of Europe whose export to free exchange countries reached 58% in 1937 as compared with 38.2% in 1929. The foreign trade of all other countries in this area was in its greater part carried out within the framework of clearing agreements.

Exchange control, introduced first to help in maintaining stable exchange rates, thus became an important instrument of totalitarian trade policy; it led to bilateralism in foreign trade, to the settlement of balances of trade between pairs of countries. The system of bilateral arrangements spread even to other parts of Europe, threatening to disintegrate further the weakened fabric of international trade. For Germany, exchange control became an integral and very important part of the nazi economic policy.

The unfavourable balance of payments also induced most Latin-American countries to establish exchange control. Already in 1931 exchange control had been introduced in Argentina, Bolivia, Brazil, Chile, Colombia, Nicaragua and Uruguay, in 1932 in Costa Rica and Paraguay, and in 1936 in Venezuela. In some countries multiple exchange rates were established according to different types of transactions. Mexico was the only major Latin-Ameri-

can country which did not have any exchange control at all; Cuba had it only during a short period. But Argentina, Brazil, Chile, Peru, Colombia and Uruguay maintained exchange control throughout the '30s, though not all of them were able to uphold stable exchange rates. Currencies of some countries had fixed relations to the pound or to the dollar. A fixed relation to the pound was established in Argentina and Bolivia, while Brazil, Chile, Colombia, Costa Rica, Ecuador, Mexico and Venezuela maintained a fixed relation to the U.S. dollar.

United States and the Gold Bloc.—When the world economic crisis came in 1930, the monetary position of countries with large gold and foreign exchange reserves remained strong. In March 1930 the U.S. was holding 57% of the world total monetary gold reserve, France held 11%, Belgium, Netherlands, Sweden and Switzerland 10%, and the United Kingdom 10%, or all these six countries together had 88% of the world total.

At the end of 1931 the foreign exchange and gold reserves of central banks were as follows:

Belgium \$354,000,000 (gold)

France \$3,541,000,000 (out of which \$2,699,000,000 were gold)

Netherlands \$392,000,000 (out of which \$357,000,000 were gold)

Switzerland \$473,000,000 (out of which \$453,000,000 were gold)

The United States \$4,225,000,000

All these nations were creditor nations. They were able to withstand even an unfavourable development of their balance of payments without having to take special measures immediately to defend their exchange rates. Nevertheless, they could not escape the task of adjusting the internal price level to the fall of prices on international markets. If they wished to maintain a free exchange system and the original parity of their currency, they were obliged to pursue a policy of deflation.

The U.S., however, having to cope with the greatest economic crisis in its history, with unemployment reaching menacing proportions and prices steadily declining, embarked upon a policy of domestic price-raising and public spending in an attempt to reduce unemployment. It was felt that the devaluation of the dollar might stimulate a

spending in an attempt to reduce unemployment. It was felt that the devaluation of the dollar might stimulate a price increase. Thus in April 1933, shortly before the World Economic conference met in London in June 1933, the dollar was depréciated. During the work of the conference, the U.S. did not consider it feasible to commit itself to stability of the dollar, and the president emphasized that for the U.S. the price development at home was of greater importance than consideration of international monetary conditions. But on Jan. 31, 1934, the U.S. dollar was newly pegged to gold. The new legal parity was defined in gold \$1–0.88867 gr. of fine gold against the old parity \$1–1.50463 gr. of fine gold.

A number of Caribbean nations adopted the policy of the U.S. Cuba, Guatemala, Haiti, Honduras and Panamá all depreciated their currencies in April 1933; Cuba and Haiti introduced new legal parities in 1934.

In the troubled days of the spring of 1933 even the U.S. thought it necessary to organize an exchange control. Already in Nov. 1934, however, it was completely eliminated. The U.S. kept a free exchange market; on the New York exchange foreign exchanges were freely quoted, and forward exchange transactions and arbitrage functioned freely. While the U.S. banks could not hold and freely export

gold, foreign holders of dollars encountered no obstacles in buying and exporting gold.

High hopes were entertained everywhere that the London Economic conference would prepare the ground for a solution of the most pressing economic and financial problems and that an international effort toward the consolidation of the world currency situation would be made. When the conference failed in achieving any of its major objectives, no substantial change in the monetary field could be expected.

France officially took the lead of the gold bloc, whose other members at that time were Belgium, the Netherlands, Switzerland and Poland. All these countries maintained a free exchange market and stuck to their 1929 parities. Of course, the devaluation of the U.S. dollar greatly increased the pressure on the currencies of the gold bloc, and similarly affected the British pound. Placed between the exchange control countries of central Europe, with whom they had a large trade, and the sterling area, the gold countries were faced with the difficult task of adjusting their price levels to international prices.

A sizable deflation was required. Yet in advanced industrial countries it was extremely difficult to carry out deflation because of the great price and wage rigidity. Belgium, as the first of the gold bloc countries, devalued its currency; the parity of the belga on March 30, 1935, was expressed in terms of gold as 0.1506 gr. fine gold as against 0.20921 gr. fine gold of the previous parity. No exchange control was introduced. Switzerland and the Netherlands were rather successful in their deflationary policy, the national economy of smaller countries being more flexible than that of large states. In France the economic and monetary situation grew steadily more difficult. Unemployment was increasing, and the government policy did not pursue any clear course. There was not very much confidence in the stability of the French franc, and this fact stimulated a substantial flight of capital from France. The gold reserve of the Bank of France declined from \$3,218,-000,000 (old gold dollars) at the end of 1934 to \$1,769,000,-000 at the end of 1936. The French government was faced with a very uneasy situation, as it had not succeeded in carrying out deflation, and it could not stop the flight of capital without introducing foreign exchange control. But France wanted to maintain a free exchange market, an indispensable feature of the gold standard.

Tripartite Agreement.—After months of an uncertain policy, France finally decided to devaluate the franc. The formal decision was preceded by negotiations with the U.S. and Great Britain and between these two countries. There was danger that a devaluation of the French franc might initiate a decline in the rate of the pound and perhaps a new wave of competitive devaluation. When, therefore, the French franc was devaluated officially in Sept. 1935, this act was accompanied by the so-called Tripartite agreement between the U.S., Great Britain and France. The agreement was intended to provide a formal basis for the flexible-gold-settlement system. According to it, exchange adjustment in the future should be made by mutual consultation and agreement. The immediate objective of the Tripartite agreement was to prevent a new devaluation cycle. It recognized the principle that exchange variations are not solely a matter for sovereign national action. It provided a gold settlement mechanism whereby the exchange funds of countries with fixed or flexible gold prices could have access to each other's markets and could cooperate in the management of gold shipments in both di-

rections. The prices governing official transactions in the countries with flexible gold prices were held stable for 24 hours in order to enable the authorities of countries with fixed gold prices to complete the conversion operation without risk. Because the French monetary situation remained unstable even after the devaluation, the Tripartite agreement had in addition to the gold settlement mechanism as its main objective the regulation of the dollar-sterling rate in the common interest of the two leading currencies and the currency areas attached to them.

The new gold parity of the French franc, fixed on Oct. 1, 1936, was 1 franc—0.0387 gr. fine gold against the previous parity of 1 franc—0.0441. The currencies of the two other members of the gold bloc, the Netherlands and Switzerland, were also devaluated in Sept. 1936. No new gold parity was fixed for the Dutch gulden. In Switzerland a flexible gold price of 0.215—0.190 gr. fine gold was introduced compared with the previous parity 0.29032 gr. fine gold. Poland, which had established exchange control in April 1936, did not follow the devaluation of the gold bloc countries.

After the French, Swiss and Dutch currencies were devaluated and the Tripartite agreement had been concluded, the devaluation process was generally considered as completed, and an era of consolidation of international monetary relations was anticipated. Hope was expressed that international co-operation in this important field would be organized, particularly as the general economic outlook in 1936–37 seemed to be improving.

Exchange rates in the year 1937 were relatively stable; the position of the agricultural exporting countries improved in the first half of 1937, and some attempts were even made to relax the strong bilateral trading control system in the Danube basin.

Prominent in the currency listing of this year were sudden capital movements, inspired partly by international political tension, partly by the radical change in conditions on the London and New York stock market. Especially was the autumn collapse in New York felt heavily. The U.S. gold reserves went up from \$6,649,000,000 (old gold dollars) at the end of 1936 to \$7,536,000,000 at the end of 1937; during the same time the gold reserve of the Bank of France went down from \$1,769,000,000 (old gold dollars) to \$1,516,000,000.

The deterioration in French finances up to midsummer was regarded as partly responsible for the sudden capital movements. The French franc was again devaluated on July 21, 1937, from 0.0441 gr. fine gold to 0.0387 gr. fine gold. In May 1938 the franc was virtually pegged to the pound at the rate of 179 francs to 1 pound.

With the exception of the unsettled French situation, the exchange rates in 1938 were also relatively stable, though to a lesser degree than in 1937. Political uncertainties and adverse economic developments were responsible for some violent movements on the market. On the whole, the world-wide depreciation in the foreign exchanges which began in 1931 advanced only a little in 1937. Only 7 of the 47 exchanges shown underwent a further depreciation in excess of 3% of their 1929 parities, comparing the September average with that of Dec. 1937.

Exchange restrictions continued in 1938 to be a major characteristic of world foreign exchange markets, and practically no country discontinued restrictions during this year. One careful survey showed on Nov. 30, that 39 out of 91 exchange areas had restrictions in force, and only 10 of the 39 were supplying foreign exchange to cover current

bills "promptly to fairly promptly."

Germany's bargaining position in the clearing agreements was strengthened first by the annexation of Austria in March 1938 and thereafter by the occupation of the parts of Czechoslovakia ceded to it by the Munich verdict. It absorbed already nearly 50% of the total trade of the Danube basin.

The dollar-sterling rate fluctuated within a moderate range in 1937, but the pound fell by 5% in 1938. In 1939, from January through August, a stable rate at \$4.68 to the pound was maintained.

Exchange rates were generally stable during the first eight months of 1939. The average dollar value was lower in June 1939 than in Dec. 1938 by 17% in China, 14% in Peru, 12% in Brazil, 4% in Rumania and 2% in the Netherlands.

This stability of the dollar value did not, however, conceal the fact that many currencies were under pressure of adverse balances of payments. The imminent danger of war caused a permanent flight of capital, particularly to the U.S., whose gold reserve at the end of 1938 reached \$8,609,000,000 (dollars of old parity). During the months January-August, \$2,600,000,000 of gold was sent to the U.S., coming principally from the United Kingdom, the Netherlands, Belgium, Canada and Japan.

These gold shipments and other stabilizing and pegging devices and of course the whole machinery of exchange control kept exchange rates generally firm.

Table II gives the value of currencies in U.S. cents in the years preceding the outbreak of World War II. All figures in Table II can supply valuable information con-

Table II.—Value of Currencies in U.S. Cents in the Years preceding the Outbreak of World War II

cerning the development of the exchange rates, but one qualifying note is necessary. Quotations of a number of exchanges included in this table did not result from free market forces; they were maintained artificially with a very elaborate exchange control system; this applied, for instance, to Germany and Italy.

A better picture of the extent of devaluation of currencies after the beginning of the world economic crisis may be obtained by indicating the value of currencies just before the outbreak of World War II as percentage of their gold parity in 1929. Here too, however, allowance must be made for all currencies the exchange rate of which was maintained artificially by exchange control, multiple exchange practices, and other devices.

Following was the parity in June 1939 as percentage of the gold parity in 1929:

Afri	ica		North America	
Union of South	Africa	56.2	The United States	59.1
Egypt		56.8	Canada	59
Latin A			d	
Argentina	official free	43.4	Australasia Australia	42.0

Ecuador		193	Iraq	56.8
Mexico		23.4	Iran	38.5
Medico		-3-4		3-3
Peru		26.1	Japan	32.3
Uruguay	official	35.2	Philippine Islands	58.9
0 ,	free	20.5		
Venezuela		96.4	Thailand (Siam)	57.3
		Euroj	be	
Belgium		72.3	Czechoslovakia	
Ü			(Feb. 1939)	68.3
Bulgaria		98.7	Norway	51.9
Denmark		46.1	Netherlands	78.1
Spain		44.3	Poland	99
Finland		48.2	Portugal	56.7
France		39.9	Great Britain Rumania	56.8 69.5
Germany		99.4	Sweden	53.1
Greece		39 98.3	Turkey	96.8
Hungary Italy			Yugoslavia	76.3
Italy		59	1 0 80010 1 10	19.3

As this table shows, only Germany, Poland, Bulgaria, Hungary and Turkey quoted officially their exchange rates as nearly at par with 1929 rates. Of course, all these rates could be considered artificial with the exception perhaps of the Polish zloty, because Poland reduced its level of prices by a drastic deflation.

Devaluation had been one feature common to the development of currencies in the '30s. There were other developments—outstanding of which was the beginning of a division of currencies into two groups or blocs. The area of exchange control included important parts of Europe and many Latin-American countries. The European exchange control countries were strongly influenced by Germany. Countries accounting for a substantial share of world trade formed the second group, the sterling area. Finally there was a third group, to which free exchange countries could be counted, whose currencies were either defined in gold or were pegged to the U.S. dollar. Among this group and the countries of the sterling area, free movement of gold and free transfer of exchange continued, so that these two groups did not differ from each other as

much as they did from the exchange control countries.

Gold kept its role of medium for the settlement of international balances, but the great movement of gold in this period resulted mostly from political disturbances. An attempt of close international co-operation was made; however, toward the end, a true co-operation existed almost solely between Great Britain and the U.S.

Impact of World War II

In view of the long duration, intensity and extent of World War II it was not surprising that its impact on the international exchange markets was heavy. No country could escape its direct or indirect effects. The financial requirements of war were extremely great; yet the technique of war financing had been so developed that all major belligerent countries, with the exception of China, were able to avoid a high degree of inflation. All nations were determined to maintain stable exchange rates. In all countries involved in the war, exchange control was introduced or further extended except in the U.S., and free exchange markets nearly ceased operating. Foreign trade transactions were carried out more and more through official channels, greatly reducing private exchange dealings. The peacetime foreign trade was reduced to a minimum, the requirements of war having everywhere the absolute priority in exchange of goods. The position of creditor and debtor nations was greatly changed.

Before discussing the situation in various parts of the world, let us first sketch the main features of the wartime development of the foreign exchange markets in the important centres.

Great Britain introduced exchange control in the last days of Aug. 1939 and let the pound devaluate 14%. Most countries of the sterling area followed this devaluation of the pound. The British gold and dollar reserves were used for purchases in the U.S.; the payments for goods and services in various parts of the commonwealth could not be met from current income; a part of the British foreign investment was sold and heavy debts in pounds were incurred. The pound remained stable throughout the whole period, but this was only made possible by two factors: one was U.S. lend-lease and the other the financing of supplies and services within the sterling bloc by the accumulation of large sterling balances owing to the members of the bloc. The position of Great Britain as the world's greatest creditor nation was definitely altered.

Germany, dominating at one time the whole continent of Europe with only small exceptions, used the economic resources of the occupied nations as well as those of its allies for its wartime needs. The system of clearing agreements was extended nearly all over the continent, and by using this instrument and collecting the so-called occupation costs, Germany was able to extract from all European nations enormous amounts of goods and services, and to leave huge accumulated claims on the clearing accounts as payments for these supplies. Obviously the creditors would be able to collect very little of these clearing and other claims. The system used by Germany for financing its imports from European countries undermined the currency situation in most of them, leaving them either in a state of disorganized monetary condition or of a latent inflation.

The United States was the only big power which was able to maintain the unchanged value of its currency as defined in gold. It was not even obliged to establish a real exchange control since the control used by it was primarily

an instrument of economic warfare. In addition to financing her own wartime needs, the U.S. was able to supply lend-lease goods and services in the total value of \$49,000,000,000 to a number of its war allies, the principal recipients being Great Britain and the soviet union. The total reverse lend-lease received by the U.S. reached by Sept. 2, 1945, \$7,345,000,000, of which \$6,306,000,000 was from the British empire.

From the monetary point of view, the lend-lease supplies were very important in aiding to maintain stable exchange rates of a great many countries.

Special circumstances in China made it extremely difficult to preserve orderly currency conditions, and the end of the war found that country in the midst of a steadily growing inflation.

Japan attempted to organize a "co-prosperity sphere" in Asia as Germany had attempted a "new order" in Europe; the Japanese yen was made the dominating currency in all territories occupied by it. With 'Japan's defeat, this monetary organization ceased, and a new monetary order was being established in the far east.

In spite of their great economic difficulties, the neutral countries were able to increase their monetary reserves.

Monetary reserves substantially increased in the Latin-American countries as a result of a favourable balance of trade during the war. This development should have helped them to improve the international position of their currencies.

Also, the countries in the middle east improved their monetary reserves after the U.S. entered the war. Spending of dollars by U.S. troops and U.S. purchases of strategic material accounted for this fact. In addition, the middle east nations were able to accumulate substantial sterling balances.

The Sterling Bloc.—A quick perusal of Table III shows that most of the changes of currency rates in the first year of the war took place in the sterling area.

Great Britain introduced exchange control on Aug. 25, 1939; the rate of the pound declined officially by 14%. The sterling rate in New York on the "free market" fluctuated, while the so-called official rate was maintained at \$4.0350. The free rate was quoted at \$3.9301 in Dec. 1939; \$3.9634 in Feb. 1940; \$3.5236 in May 1940 (the lowest quotation being \$3.1000). With the approval of the U.S. treasury and the federal reserve authorities, a private arrangement was concluded between the British authorities and U.S. banks, which involved the blocking of U.S. investments in Great Britain, a severe limitation of the use to which U.S. sterling balances could be put, and the gradual extinction of the "free market" for sterling in New York Upon this arrangement the free sterling rate in New York recovered rapidly; it was quoted in August at \$3.9788 and in Oct. 1940 at \$4.0326. The extreme narrowness of fluctuations in free sterling in the spring of 1941 was taken as an indication of the firm control which the London authorities had acquired over the whole sterling area.

The devaluation of the pound was not followed by all nations which before the war were counted as belonging to the sterling area. Denmark, Estonia, Norway, Latvia, Sweden and Iran pegged their exchange rate to the U.S. dollar. The British nations, as well as Portugal, Egypt and Siam let their currencies depreciate in Sept. 1939.

The sterling area was completely transformed. As mentioned above, it was left by most of the non-British nations; exchange control was initiated and the sterling area or bloc became a unit for exchange control purposes. It acquired an exact definition. Its membership was extended during the war, and almost throughout this whole period it consisted of the British commonwealth and empire (except Canada and Newfoundland), British mandated territories, British protectorates and protected states, Egypt, the Sudan, Iraq (except for a few months in 1941), the Belgian Congo, the Ruanda-Urundi and the Faeroe Islands. During 1941, the sterling area was widened by the Free French territories in Equatorial Africa, French Oceania and French establishments in India, and in 1942 by Syria, Lebanon and Iceland. In Feb. 1944 the French overseas territories, Syria and Lebanon were placed outside the sterling area, and in Oct. 1944 the Belgian Congo and the mandated territory of Ruandi-Urundi were removed.

Here the agreement which was concluded between France and Great Britain on Dec. 12, 1939, should also be mentioned. Although France did not become a member of the sterling bloc, the agreement itself supported the policy of this bloc indirectly. The rate between the two currencies was fixed at fr. 176.625 to £1, and later this rate applied also to the Free French territories. Under the agreement, the problem of sharing equitably the expenses which were necessitated by the conduct of the war and which had to be defrayed in gold and dollars would be kept under review. The francs required by Great Britain (including those for the British expeditionary forces) were to be provided against payment in sterling, and sterling required by France (including those required for the purchase of raw materials in the British empire) would be provided against francs. In July 1941 a financial agreement was signed with the U.S.S.R. establishing a centralized clearing account at the Bank of England in the name of the State Bank of the U.S.S.R. The rate applied was f_1 = roubles 21.38, corresponding to roubles 5.03 = \$1.

The fact that the pound-dollar rate remained at about the same level (£1-\$4.021/2-4.031/2) throughout the war

helped to maintain order and stability in the international exchange situation, the influence being felt throughout the dollar and sterling areas.

By the end of 1940 the British government had established virtually complete control over Britain's foreign exchange transactions. This objective was attained through an extensive series of payments and clearing agreements which resulted in sectionalizing the British exchange market and in canalizing its international economic and financial transactions. Throughout the whole sterling area, the same rules were applied to the transfer of sterling into dollars or other "hard" currencies. With outside free currency countries-Switzerland and the U.S.-Britain employed "registered" accounts; with most other countries outside the sterling area, "special" accounts; with countries inside the area, sterling exchange for residents and sterling area accounts for nonresidents. All of these accounts were strictly bilateral, except for the last category, which was fungible as among the various countries of Central America.

The exchange control system was somewhat liberalized in 1943 to simplify administration. The "registered" accounts, sterling area accounts and the prewar accounts were all merged into one category under the heading "registered" accounts. In July 1945 the exchange control was further simplified. "Registered" accounts in sterling for residents of the U.S. and for residents of Central American countries were discontinued. Sterling on these accounts were freely transferable to any other "Americas" account and were convertible in dollars at the official rate of the day. Until Sept. 30, 1945, they were exchangeable into dollars at \$4.021/2.

As to the exchange rates of other British members of the sterling bloc, the Australian pound, after some fluctuation of the "free" pound during the first year of the war, maintained a stable rate of \$3.2280. The New Zealand pound fluctuated greatly throughout 1939–40. It reached the rate of \$3.2274 in Sept. 1940 and remained stable at that rate. The South African pound had shown great stability during the war, its rate being \$3.98–4.0050. The rate of the Indian rupee declined from 34.92 cents in June 1939 to 29.93 in Sept 1939, and after 1940 was maintained stable at the rate 30.122–30.182 cents.

The nations of the sterling area during the war had to mobilize and pool their resources of gold and dollars. The reason for this dollar pool was the extreme dollar shortage, which arose mainly from the fact that Britain and other sterling area nations made large cash purchases of war goods in the U.S. Between Sept. 1939 and March 1943 Britain alone spent more than \$6,000,000,000; to pay for these goods it mobilized and sold most of its dollar resources.

At the beginning of the war all Britons had to surrender to the government their holdings of foreign exchange (bank balances and currency) payable in the U.S. Later on, other foreign exchange had to be surrendered. Compensation was paid in pound sterling. All residents in Great Britain had also to register all their holdings of securities of which the principal or interest was payable in U.S. dollars. The British policy was dictated by its military situation, which changed completely in 1940. Its production was insufficient to sustain its military effort. It needed large supplies of armament which could be obtained only in the U.S. To pay for these munitions it took over the U.S. investments of British citizens, compensating the owners in sterling, and sold all of those which were marketable in the U.S. for dollars. A few months later the dollar resources were almost exhausted, and only the Lend-Lease act assured Britain of a continuing supply of munitions and other essential requirements from the U.S. despite the exhaustion of its dollar resources. It enabled Britain to increase the size of its armed forces and to concentrate on war production, reducing its exports drastically. But Great Britain needed many goods and services from the U.S. which were outside the scope of lend-lease. In 1944 Britain and other sterling area nations spent more than \$1,000,000,000 in the U.S., at the same time when British exports were reduced to 31% of the 1938 volume. The dollar shortage was partly eased when expenditures of the U.S. armed forces in the sterling area became larger.

Shortly after the beginning of the war, the sterling area countries entered into an agreement to pool their resources of foreign exchange. All nations undertook—as most of them had been doing before the war—to sell their foreign exchange income to Britain and thus to maintain the whole of their reserves in the form of sterling assets. (The Union of South Africa continued to hold gold, and its gold reserve increased from \$220,000,000 in Dec. 1938 to \$982,000,000 in Dec. 1945.) They also agreed to be sparing in their use of dollars in order to reserve them for the purchase of essential supplies from the U.S. Britain promised to supply from the pool the dollars and other currencies required for the essential imports of the member countries.

The main feature of the dollar pool arrangement was the agreement of the sterling area countries to limit their demands upon the pool to their really essential needs. But each nation remained responsible for its own import program. Whenever a nation granted to its nationals licences for imports from the U.S., the dollars were allocated by the pool. Co-ordination of the operation of the various exchange controls was attained by constant discussion and exchange of information between members. One of the most important aspects of the sterling area during the war was the piling up of credit balances of the member countries in Great Britain itself in return for goods and services supplied to her.

The sterling balances arose in three distinct ways. First, Britain imported much of its food and raw materials from sterling area countries; for these purchases the nations sold it the necessary amount of their own currencies in exchange for sterling. Second, Britain made huge payments for military purposes inside the sterling area countries, particularly the middle east and India. (British wartime expenditures in India under a special agreement made in Nov. 1939 totalled about \$4,124,000,000 up to April 1945.) Third, a part of the sterling balances resulted from net sales of dollars to Britain by other sterling area nations under the pooling agreement.

The sterling balances could be drawn upon for purchases within the sterling area. Moreover, they could be used to pay off sterling debts owed by the nation concerned. As a matter of fact, the sterling balances would have been even higher had it not been for a substantial repatriation of British investments in the sterling area countries.

The British balance of payments was maintained and the rate of exchange was supported by four sources of supplies from abroad. The greatest as to amount was the U.S. lend-lease aid for the British empire, which reached a total of \$30,750,000,000, as compared with \$6,306,000,000 of reverse lend-lease aid; lend-lease exports to Great Britain totalled \$13,879,000,000; the Canadian grant in

aid amounted to Can. \$2,000,000,000; the sale of British foreign investment—disinvestment; newly contracted loans and the accumulated sterling balances.

The total amount of British disinvestments abroad during the war was $f_{1,118,000,000}$, divided as follows:

In sterling areas564
Dominions, not including Canada201
India, Burma and middle east348
Colonies and other sterling area countries 15
United States203
Canada225
South America
Europe
Rest of world

The total external liabilities reached £3,355,000,000 in June 1945, compared with £476,000,000 in Aug. 1939. The sterling balances increased during this period from £476,000,000 to £3,052,000,000. Total external disinvestments from Sept. 1935 to June 1945 amounted to £4,198,000,000.

The external liabilities, according to the White Paper of Dec. 1945, were divided as follows:

Sterling area	f million	
Dominions	384	
India, Burma, middle east	1,732 }	2,723
Other sterling area countries	607	
North and South America	303)	
Europe	267 }	632
Rest of world	62	·

Of the sterling balances outstanding on June 30, 1945, roughly £1,070,000,000 were owed to India; £350,000,000 to Egypt; £170,000,000 to Eire; £115,000,000 to Australia; £110,000,000 to Palestine; £100,000,000 to Malaya; £63,000,000 to New Zealand and £27,000,000 to South Africa. A sizable amount was owing to British colonies. Among the non-sterling countries, Argentina held a balance of £105,000,000, followed by Portugal with about £90,000,000. Brazil and some Latin-American countries held smaller balances.

India, the greatest creditor of sterling balances, repaid or repatriated also the greatest part of her foreign indebtedness. About £300,000,000 of India's sterling debts had been repaid or repatriated by 1946; practically the whole public debt had thus been eliminated. British commercial and industrial investments in India were estimated at about £250,000,000.

Egypt, Iran, Iraq as well as Palestine, were able to repay debts. South Africa repatriated public bonds from London. It seemed that all empire countries were now creditors of Great Britain with the exception of Australia and New Zealand.

Great Britain entered World War II with £605,000,000 net gold and U.S. dollar reserves and it possessed foreign investments estimated at £4,000,000,000. Up to June 30, 1945, it sold £1,118,000,000 of external capital assets, its foreign liabilities increased by £2,880,000,000, and it had £453,000,000 of gold and U.S. dollar reserves. Its creditor position had been basically altered and the structure of its balance of payments had changed. Its postwar import requirements of food, raw materials and machinery to replenish its depleted stocks added to the magnitude of its task of monetary reconstruction.

As already mentioned, the position of the British dominions developed differently. Canada, similar to India and South Africa, was able to reduce its external indebtedness by Can. \$1,500,000,000. In general, the war changed the financial interrelations among the countries of the British commonwealth.

Continental Europe.—Germany's military successes during the first years of World War II enabled it to extend its rule over a great part of the continent, so that by 1942 only very few countries remained outside direct German economic domination. These countries were Switzerland, Sweden, Portugal, Spain and Turkey. The occupied as well as the satellite nations were made a part of the continental economy directed by Berlin. The German mark became its key currency. Germany had already an established relation between the mark and the currencies of its allies—Hungary, Bulgaria, Rumania and Italy—previously determined in the respective clearing agreements; now the currencies of the occupied nations were brought in a fixed relation to the mark.

In the occupied countries in western Europe Germany fixed the following rates:

Rate in national	Rates of	Rates of
currency for RM. 1	May 9, 1940	April 1, 1941
Norway in crowns	1.76	1.76
Denmark in crowns	2.07	2.07
Holland in florins	0.75	0.75
Belgium in belgas	2.39	2.50
Luxembourg in francs	9.57	10.
France in francs	17.84	20.

With the exception of France, the rates followed almost the previous parity of the free mark, which was greatly overvalued.

From April 1, 1941, full freedom of payments was established between Holland and Germany, including the right to bring notes and other means of payment from one country to the other. The Dutch-German clearing ceased to operate as far as payments between the two countries were concerned but remained in force with regard to payment between Holland and third countries. In Luxembourg the reichsmark alone was made legal tender from Jan. 1941. In March 1941 the reichsmark alone was declared legal tender in Alsace and Lorraine, and the two provinces were incorporated into the German currency system. In Jan. 1942, the Danish crown was appreciated by 8.2% so that the pre-Sept. 1939 relationship between the German and the Danish currency was established.

In 1940 and 1941 negotiations were carried out between Germany and the Danubian countries for the purpose of bringing the rate of the reichsmark more into line with the quotations of the dollar, Swiss franc and other "free currencies." Through a series of changes in the latter half of 1940 the discount of the reichsmark on free currencies had been limited to a maximum of about 20%. This was done so that in some cases the premiums applicable to the reichsmark had been raised, in others the premium on the sale or purchase of the free currencies was reduced, and finally the combination of both methods was employed. In 1941 further steps were taken to eliminate the discount on the reichsmark; here again the methods varied from country to country. The changes are summarized as follows:

			July 1, 1940			April 1, 1941			April 1, 1942			
			Swiss fr.		% pre- mium of Sw. fr.	Swiss	0	pre- mium f Sw.	Swiss		% pre- mium of Sw.	
						fr.	RM.	fr.	fr.	RM.	fr.	
Bulgaria						23.78	32.75	20	19.02	32.75	0	
Greece	•		34.20	46.50	23	34.20	48.50	18	34.20	60.	-2	
Hungary						1.19	1.66	19	0.98	1.66	2	
Rumania	•	•	48.27	49.50	42	44.	59.50	22	44.13	59.50	22	
Yugoslavia (Serbia, C				14.80	33	12.63	17.82	18	11.60		0	

Only Rumania did not adopt a uniform valuation of the RM. and hard currencies, even in 1942. In March 1939, when Czechoslovakia was annexed, the rate between the reichsmark and the Kč. was fixed at 10 Kč.=1 RM. (instead of the previous quotation of 11.62 Kč.=1 RM.). In relation to other currencies the old rates were retained; this meant, for instance, that the dollar continued to be quoted at Kč. 29.25 instead of Kč. 25, as would have been the case if the dollar rate were calculated via the RM. This disparity ended on Oct. 1, 1940, upon the abolition of the customs frontier between Germany and the protectorate of Bohemia and Moravia. The same day the exchange relation between the protectorate crown and the Slovak crown was altered from 1 K.=1 Ks. to K. 10=Ks. 11.62.

After the occupation of Poland and Yugoslavia, the monetary system of these countries was entirely reorganized.

The Ukraine Central bank, established in March 1942, issued the carbovanez. A bank of issue called "The Ostland Central Bank" was opened in Riga in April 1943.

The official rate of the Italian lira had been reduced in Sept. 1931 from \$5.261/4 to \$5.05=Lit. 100, but at the end of May 1941 it was raised again to \$5.261/4. This raising of the lira rate on the dollar was followed by corresponding adjustments in the rates of a number of other currencies (including the reichsmark, the Swiss franc and the Swedish crown). The rate between the lira and the reichsmark was fixed at Lit. 7.63=RM. 1. This rate was maintained until after the surrender of Italy in the fall of 1943, when the rate Lit. 10=RM. 1 was established for that part of Italy occupied by Germany.

Germany made great efforts to hold the stability of the exchange rates in all countries under its domination. It maintained these rates even in its clearing agreements with southeast European countries whose prices went up sharply, because it was not possible to check the evergrowing inflation.

With the increasing all-out economic mobilization, Germany's pressure on the economies of the European nations became more and more rigid. It tried to exact from them the largest possible amount of goods and services without being able to supply them with the commodities they needed. Pursuing this policy, Germany organized a central clearing "Verrechnungskasse" in Berlin, to which 17 out of 20 countries in continental Europe were linked, the remaining three being Portugal, Spain and Turkey. This central clearing office, planned as a multilateral clearing system, centred around the reichsmark, and dominated the flow of trade and foreign payments on the continent until 1944. The major part of trade of the European nations was transacted with Germany, the remainder with the other nations in the nazi orbit. With the possible exception of Finland, Norway and Slovakia, exports to Germany exceeded imports. France dealt with Belgium, Holland and Norway through Berlin, but concluded transactions with other countries directly. Norway dealt directly only with Sweden and Denmark; even the mutual payments between Bulgaria and Rumania were cleared through the Berlin central office. Nearly 75% of foreign trade of Switzerland and more than 80% of that of Sweden were paid via clearings in 1942.

The tendency of Germany to run into debt on clearing accounts was intensified during 1942. Clearings ceased largely to serve their original purpose of equalizing incoming and outgoing foreign payments and became a credit device by which a government advanced the funds necessary to enable its country's export trade to continue even when no adequate countervalue was obtained from the importing country.

Thus Germany made use of the resources of other countries through the mechanism of clearings and also through contributions levied to meet occupation costs. It was evident that this procedure developed inflationary pressure in these "creditor" nations.

Germany's clearing debts and assimilated accounts amounted in Sept. 1944 to RM. 31,500,000 divided as follows (in millions of RM.): France, 8,000; Holland, 5,750; Belgium, 5,370; Denmark, 3,360; Hungary, 980; Rumania, 900; Bulgaria, 1,200; Slovakia, 500; Bohemia and Moravia, 4,600 and Switzerland, 600.

The occupation costs paid to Germany by all countries reached in Sept. 1944 the total of RM. 84,000,000,000, out of which France alone paid RM. 35,250,000,000. Altogether, Germany obtained in a little over four years—from June 1940 to Sept. 1944—about RM. 123,000,000,000, calculated at the official rates; about two-thirds of this amount was exacted as a levy to meet occupation costs, while the remaining third, around RM. 40,000,000,000 left behind a German debt, usually in the form of liabilities or clearing accounts.

Thus Germany organized a kind of forced lend-lease for herself among the European countries, greatly disrupting the monetary structure of her creditors.

The Neutral Countries.—As could be expected, the monetary position and the monetary reserves of the neutral countries improved during the war. Following are the figures concerning the gold reserves of these countries (in millions of dollars):

	Dec. 1939	July 1945
Switzerland	701	1,073
Sweden	308	478
Turkey	129	234
Spain	••	109
Portugal	69	6ŏ

In addition, the dollar and sterling balances of these countries also increased, especially in Spain, Portugal and Turkey. The development of the exchange rates is shown below (in cents per unit of foreign currency):

Sept. 1938 1940	Sweden 25.48 23.802	Switzerland 22.97 22.58 22.676	Portugal 4.42 3.66 3.711	Spain 5.60 10.49 9.32
1941 (average of daily rates for part of the time during which quotations were		·	0.	• •
certified)	23.829	23.210	4.00	9.130
Feb. 1946	23.852	23.363	4.05	9.132
July 1946	26.195	23.363	4.05	9.132

While the rate for the Swedish, Swiss and Portuguese currency showed only little change in the first postwar year—compared with the prewar quotations—the Spanish peseta declined by more than 10%. Sweden introduced exchange restrictions in Feb. 1940; at first they were mainly designed to control capital movements but were also used as a means to control imports, especially in the spring of 1940.

In Switzerland, the year 1940 was characterized by unusually strong movements on the foreign exchange market. In the first half of the year, the national bank and the Equalization fund furnished the market with dollars to an equivalent of nearly Swiss fr. 500,000,000 to pay heavy imports and to meet withdrawals of funds owned by foreigners. In the second half of the year the trend was reversed, and the national bank added nearly Swiss fr. 650,000,000

to its foreign exchange holdings. The main reason for this movement was the fear that Swiss assets in the U.S. would be placed under the licensing system by the U.S. government. Switzerland had not introduced exchange restrictions, yet an informal arrangement took place between the national bank and the other banks. The national bank demanded information as to the origin of the foreign exchange offered to it. The bank was anxious to prevent blocked dollars from being liquidated through the Swiss market, but it accepted all exchange resulting from Swiss exports or representing repatriation of funds in Swiss ownership. At the same time, sales of exchange for foreign investments were also controlled.

The rate of exchange of the dollar in Spain had been raised from pesetas 9.00 to pesetas 9.90=\$1 in Sept. 1939; in April 1940 the dollar selling rate was pegged at pesetas 11.22. When a "special account" for Spain was opened in London, the free market quotation for the peseta was discontinued in London and was replaced by the Bank of England clearing rates; that is, an official rate of pesetas at 40.50 = £1 and a so-called "voluntary rate" of 46.55.

When World War II started, the Portuguese escudo was pegged to the pound at the rate of Esc. $110=\pounds1$. In Nov. 1939 the escudo was related to the dollar at the maximum rate of Esc. 27.50=\$1, while the rate of the pound was fixed at Esc. 108.25=£1. When the free sterling rate recovered in the summer of 1940, the escudo was pegged to the pound as from Aug. 1, 1940, at a rate of Esc. 99.50=100.50=£1, corresponding to a dollar quotation of about Esc. 25=\$1. The exchange market remained free from official restrictions, but the Bank of Portugal maintained contact with the commercial banks to ensure collaboration with the general aims of the bank's monetary policy.

As the influx of dollars into Switzerland continued, the National bank asked the Swiss banks in Jan. 1941 to offer the bank only such dollars as belonged to persons domiciled in Switzerland. The Swiss National bank wanted to avoid the increase of its dollar reserve on account of financial transfers. The national bank paid for dollars which it absorbed a minimum of Sw. fr. 4.30, the convention with the banks providing for a range of rates from Sw. fr. 4.23–4.33. Dollars of which the Swiss owners might dispose but which were not bought by the banks (such as income from dividends) might still legally be dealt in on the market. These transactions were often settled via New York at a rate sometimes about Sw. fr. 3.30.

In Sweden, the Central bank maintained a fixed dollar rate of S.K. 4.20, absorbing all the dollars offered to it. The exchange control was applied very liberally.

Also in 1942 the Swiss authorities had to deal with the problem of absorbing large offers of dollars which were subject to the freezing provisions imposed in the U.S. The bank monetary reserves were steadily increasing. In 1942 three-quarters of the Swiss foreign trade was carried through clearing accounts with Europe. Only with Sweden and Portugal were payments freely made. Switzerland resisted the temptation afforded by New York premiums on francs (rates as low as Sw. fr.=\$1 were occasionally quoted in New York) to raise the officially pegged rate, preferring to combat rising domestic prices by taxing exports and applying the proceeds to an import subsidy. In Aug. 1942 an export embargo was placed on gold.

The foreign exchange position of Spain was so strengthened in 1942 that the so-called voluntary rates which had been quoted in addition to the official exchange rates were abolished. (For instance, the reduction to the dollar was

from the "voluntary" rate of pesetas 12.56 to 10.95, for sterling from 46.55 to 40.50 official rate.)

The Bank of Portugal decided in June 1942 to reintroduce the circulation of gold in the form of the new coin, the dubray, equalling 1,000 escudos.

Turkey likewise exploited an appreciation of its standard on Aug. 5, 1942; the import premiums paid for "free currencies" were reduced, but the export premiums were retained at former levels to combat rising domestic prices and to counterbalance the extensive foreign claims against Turkey. During 1943 Turkey was the smallest participant in Europe's German trade. Agreements concluded with the German group were little more than isolated barter pledges, generally providing for the shipment of German goods prior to the execution of Turkish sales.

The growing military power of the Allies strengthened the bargaining position of Sweden and Switzerland with regard to Germany. Both countries had clearing agreements with Germany. The Swedish credit to Germany was strictly limited as to time and amount. In 1941 the Swedish Reserve Stock office made a credit of Kr. 100,000,000 available to the clearing office to finance exports to Germany until the end of 1941. Credits granted directly to the Swedish exporters were partially insured by the Government Export Credit office. The total of official and private credits outstanding at the end of 1942 amounted to Kr. 70,000,000. No new credits, official or private, were granted in the first half of 1943. Sweden refused to accept German gold and in an agreement of 1944 demanded anticipatory payments.

In July 1941 the Swiss government gave guarantees to the exporters, within the scope of the clearing agreement with Germany, up to the credit amount of Sw. fr. 400,000,000, while a further Sw. fr. 400,000,000 would be made available for the period up to the end of 1942. (A total equivalent of RM. 465,000,000 at the official rate RM.= Sw. fr. 1.76). The waiting time for Swiss exporters was limited to three months.

No definite result was achieved in negotiations for the renewal of the clearing agreement expiring at the end of 1942. Clearing was maintained and it was decided that the Swiss exporters might avail themselves of such balances as had remained unutilized in the previous credit.

The Swiss clearing agreement, which expired on Jan. 15, 1943, was renewed late in the year only after long negotiations. In the interim, a de facto clearing system for a limited volume of trade was maintained, and the federal guarantee on clearing claims lapsed. Ultimately a trade agreement which approached more closely bilaterally balanced exchanges was concluded in Oct. 1943.

In Oct. 1944 the Swedish exchange regulations was tightened to prevent a major influx of foreign exchange from abroad.

The liberation of France in 1944 stopped trade between Germany and Spain and Portugal. Both the latter countries derived great profits from the economic warfare conducted in their territory, the Allies as well as Germany attempting to buy strategic commodities often regardless of price.

Sweden further reduced its trade with Germany, partly under Allied pressure. Somewhat more difficult was the position of landlocked Switzerland, which was dependent on Germany and the countries controlled by Germany for many vital supplies.

The United States.—The strong technical position of the U.S. dollar was not weakened by the war, although extremely heavy demands were imposed upon the U.S. economy. The U.S. was the only major country whose cur-

rency's ratio to gold remained unchanged from the prewar period. The treasury's buying price for gold was \$34.9125 (\$35 less 1/4%) per one fine ounce, the selling price was \$35.0875 (\$35 plus 1/4%) per one fine ounce. The gold reserve at the end of the war amounted to \$20,088,000,000 as compared to \$17,644,000,000 in Dec. 1939.

The U.S. did not introduce foreign exchange restrictions in the proper sense of the term. The number of foreign exchanges quoted on the New York exchange market, however, was steadily reduced as a result of war.

The country had to mobilize all its resources and spend enormous amounts to meet all war requirements. In addition, it was able to supply its allies with a huge amount of goods and services through lend-lease. It emerged from the war as potentially the biggest creditor nation.

During the first year of the war, great orders for ammament were placed by Great Britain under the "cash and carry" provisions. Of the total gold and dollar resources of Great Britain, amounting to nearly \$4,500,000,000 on the outbreak of hostilities, rather more than one-half had been utilized by the end of 1940. The U.S. foreign trade showed in 1940 an export surplus of \$1,396,000,000. This, plus continuous flight of capital seeking a refuge, was responsible for a further increase of the gold reserve from \$17,644,000,000 in Dec. 1939 to \$21,999,000,000 in Dec. 1940. It increased to \$22,726,000,000 at the end of 1941.

Special loans granted by the Export-Import bank and the Exchange Stabilization Fund assisted several countries in Latin America and also China in promoting stability of their exchange rates. By an executive order of April 10, 1940, the U.S. began to freeze the gold and dollar resources of different countries. This measure was designed to protect the assets in the U.S. which belonged to governments and nationals of invaded European countries, from seizure by the invader. Such assets were available for payments only with the consent of the treasury; the measure developed soon to an important instrument of economic warfare. In 1940 the assets of the following countries were frozen: Norway, Belgium, Holland, Luxembourg, France, Estonia, Latvia, Lithuania and Rumania. The currencies of the "blocked" countries ceased to be quoted on the New York exchange. During the early months of 1941, Bulgaria, Greece, Hungary and Yugoslavia were added to the list; on June 14, 1941, the assets of Finland, Germany, Italy, Portugal, Spain, Sweden, Switzerland and all other countries on the continent of Europe were made subject to freezing.

On July 25, 1941, the U.S. freezing control was extended to non-European countries. Assets of Japan and China were blocked—the latter at the specific request of the Chinese National government. This step was clearly an aggressive measure taken at that time to react to further Japanese occupation of Indo-China. Its principal effect was to bring trade between the U.S. and Japan to a complete stoppage. On Dec. 9, 1941, Siam was added to the list of countries whose assets were frozen.

An executive order of Dec. 26, 1941, provided for automatic freezing of the assets of any territory in the event of its being occupied by countries at war with the U.S.

According to the mechanics of the U.S. foreign fund control, transactions affecting assets of blocked countries and their nationals were prohibited except as specifically authorized in the regulations and licences issued by the U.S. treasury. Special licences were usually issued if there was reasonable certainty that the axis would not benefit from the transaction for which the licence was requested, and if it appeared that the blocked national would suffer were the licence denied. General licences were issued to

cover transactions which, because of their nature and of some characteristic of the owners, could be treated as a class. General licences were obtained by Sweden, the Swiss National bank, Spain and Portugal.

When all countries on the continent of Europe became subject to "freezing," the dollars could not be used for paymens to them. The dollar had, in fact, even before the U.S. entered the war, ceased to serve as medium for international settlement in Europe; instead, greater use was made of gold. The last vestige of the international character of the dollar disappeared.

In 1942 Foreign Funds Control applied to more than 35 countries, including the whole of continental Europe (except Turkey), China, Japan and the countries occupied by Japan. The "frozen" assets consisted not only of bank deposits, gold and securities, but also of a great number of business enterprises as well as patents and other forms of property. The Foreign Funds Control was carried out by an organization created within the treasury department. Much of the field work which concerned licences to effect transactions subject to the control was delegated to the federal reserve bank.

In order to provide the information necessary for the administration of the control, a census of all foreign property subject to the jurisdiction of the U.S. was taken by the treasury department. Reports on nominal ownership both as of June 1, 1940, and of June 14, 1941, were required. The total value of the property reported in the census was in excess of \$13,000,000,000. The blocked funds held in the U.S. in 1943 amounted to about \$8,500,000,000. In 1944 a census taken of U.S. owned property abroad showed the existence of such property valued at more than \$14,420,000,000.

In Aug. 1944 the Argentine gold holdings were frozen. On March 13, 1942, the treasury department took action to control the importation of foreign and domestic currency into the U.S. from any blocked country not falling within the general licence trade area or from nationals of axis and certain other countries. Upon importation, such currency had to be forwarded immediately to the Federal Reserve bank in New York, and was held by the Federal Reserve bank until the treasury department authorized its release. As a result of these limitations in the free transfer of notes, dollar notes were quoted in Europe well below par. In the spring of 1942 the rate in Switzerland went down to Sw. fr. 2=\$1.

In addition to the freezing of assets held in the U.S., the blockade of the axis was tightened further by the issuance on July 17, 1941, of "the Proclaimed List of Certain Blocked Nationals." This list and supplementary lists contained the names of suspected, unfriendly persons and firms in Latin America which were to be considered as blocked nationals under the provisions of the above mentioned executive order. Late in 1943 the unpublished list of "Special Blocked Nationals" was compiled, and two important semipublic banks in Argentina, the Banco de la Nación and the Banco de la Provincia de Buenos Aires, were appended to that list. In Aug. 1943 a prohibition was placed on the importation of cheques, bills of exchange and promissory notes from all blocked countries excepting China.

In co-operation with the American Commission for the Protection and Salvage of Artistic and Historic Monuments in War Areas, steps were taken in 1944 to make sure that the axis would not be able to dispose of looted art objects on the U.S. market. The main objective of all

these provisions was not to protect the rate of the dollar; they were weapons of economic warfare and measures to keep the property of the countries occupied by the axis powers safe.

The demand for armament supplies of the U.S. increased greatly after the defeat of France and became steadily intensified with the long duration and geographical extension of the war. Yet the Allied nations did not possess dollar and gold reserves ample enough to pay for the needed supplies. Instead of granting loans as during World War I, a new instrument was used this time. On March 1, 1941, the Lend-Lease act was passed, which provided for the furnishing of war materials, food and other supplies to nations "whose defense the President deems vital to the defense of the United States." Although the Lend-Lease act was originally contemplated to assist Great Britain, whose dollar and gold reserves were nearly exhausted at that time, lend-lease supplies were extended to the soviet union in July 1941, and later to practically all United Nations, even to some nations who were not belligerent (for example, Turkey). Canada did not accept any lend-lease supplies and concluded a special agreement with the U.S.

Commercial trade during 1943-45 ended with a total import surplus of more than \$2,000,000,000. The gold reserve of the U.S. decreased from \$22,726,000,000 in Dec. 1942 to \$20,065,000,000 in Dec. 1945 or by \$2,661,000,000. The import surplus in commercial trade was one reason for the gold export and for increasing foreign owned dollar balances. Over the five years from July 1, 1940, through June 30, 1945, the U.S. government spent abroad \$13,045,000,000, of which \$4,000,000,000 to \$5,000,000 was spent to purchase vitally needed food and raw materials. A similar amount was spent to pay U.S. troops overseas. The government agencies held abroad more than 3,000 installations, acquired at a cost of \$2,413,000,-000, of which 95% were military installations. Out of the total disbursements abroad of \$13,045,000,000, \$6,375,000,ooo went to the British commonwealth, \$3,326,000,000 to the American republics, \$986,000,000 to China, \$541,000,-000 to France and its possessions and \$127,000,000 to Italy and its possessions.

The magnitude of the lend-lease exports and the total foreign trade figures of the U.S. for 1941-45 is indicated as follows (in millions of dollars):

		Export	Exces Import Exces	s of	exports +
1941	Total	5,147	3,345		1,802
0.	Lend-Lease	740	3.515		
	Commercial	4,406		+	1,061
1942	Total	8,079	2,744	+	5,334
• -	Lend-Lease	4,932			
	Commercial	3,147		+	402
1943	Total	12,964	3,381	+	9,583
	Lend-Lease	10,357			• • • •
	Commercial	2,606	• • •		775
1944	Total	14,257	3,920	+	10,337
011	Lend-Lease	11,305	•		
	Commercial	2,952			969
1945	Total	9,806	4,136	+	5,670
0.10	Lend-Lease	5,561	• • • •	•	
	U.N.R.R.A.	355			• • •
	Commercial	3,874			262

As already mentioned, total lend-lease aid reached \$49,096,000,000 by Dec. 31, 1945. Lend-lease exports totalled \$32,872,000,000; Great Britain obtained \$13,879,000,000;

the soviet union \$9,553,000,000; members of the British empire \$4,567,000,000; Egypt \$20,028,000,000.

The expenditures of the U.S., including those for the growing number of U.S. forces stationed abroad, strengthened the monetary situation abroad and especially the dollar position of many countries. The growth of foreign dollar resources in 1943 and 1944 was the largest since 1935, while more gold was earmarked in the U.S. on foreign accounts than in previous years in spite of a gold export from the country. Dollar balances of countries other than the U.S. increased from \$3,500,000,000 in Dec. 1941 to \$5,510,000,000 in June 1944, and there was a further increase in 1945.

At the end of 1941 gold reserves of countries other than the U.S. totalled \$10,800,000,000; in June 1945 they were \$16,400,000,000—an increase of \$5,600,000,000. Thus, as the result of the wartime development and the policy of the United States, the gold and dollar reserves of other countries were substantially higher at the end of the war than they were at its beginning. Their geographical distribution had of course changed greatly; Europe as a whole was the great loser.

In the autumn of 1945 the gold and dollar holdings of countries other than the U.S. were reported to have approached a figure of \$30,000,000,000; but this total included assets outside the monetary reserves of central banks and governments.

Even during the war it was evident that the U.S. dollar, whose technical position remained very strong, would become the basis of a new international monetary standard.

Canada.—Although not a member of the sterling bloc, Canada depreciated its currency at the outbreak of World War II. The Canadian dollar went down on the New York market from 99.77 in June 1939 to 91.25 in Sept. 1939, reached the low level at 80.07 in June 1940, and became rather stable in 1941. The average New York buying rates were as follows: 1941–87.345; 1942–88.379; 1943–89.978; 1944–89.853; 1945–90.485.

The Canadian dollar regained its stability on a lower level practically after 1942. The relation to the pound remained stable throughout the war fixed at £1 = Can. \$4.43-4.47.

Exchange control was introduced in Sept. 1939. The exchange restrictions were tightened in 1940 and were supported by import control based on the War Exchange Conservation act of 1940. In 1941 travel abroad was prohibited except by permission of the Foreign Exchange Control board, and prepayment for imports was restricted. In 1942 the exchange control so far as relations with the U.S. and the sterling area were concerned could be somewhat liberalized. Import of gold was made subject to a licence.

In 1943 the foreign exchange position showed a strengthening; a great change in the U.S. dollar position was disclosed in April 1944, when a revision of the financial arrangements of the Hyde Park Declaration of 1941 was announced. During 1943 Canada's supply of U.S. dollar exchange increased beyond expectations and a series of measures was taken to reduce Canada's holdings in U.S. dollars to an agreed range. These measures included payments to the U.S. for the construction of airfields built in Canada by the U.S. government. Furthermore, schedule I of the War Exchange Conservation act prohibiting and restricting imports from nonsterling areas was repealed. A relaxation of exchange regulations made allowance for a limited increase in pleasure travel of Canadians into the U.S. Throughout 1944 an influx of capital to Canada continued, net sales of securities to other countries reached

in that year about \$97,000,000 and amounted to a net capital influx of Can. \$436,000,000 in the period 1939 to 1944. The principal item was the large volume of sales of Canadian bonds to the U.S. Tourist restrictions to the U.S. were further relaxed.

The chief problem which confronted Canada in its balance of payment was that it formerly had an export surplus with Great Britain which had gone a long way toward meeting its deficit with the U.S. It was obvious that Great Britain would now need a much larger supply of goods from Canada, but that it would not be able to pay the import surplus in gold or U.S. dollars. A further deficit in the Canadian balance of payments with the U.S. was expected. Canada increased the production of a great number of goods and introduced a very well-functioning price and wage control. Canadian supplies became an important item for the prosecution of war. The expansion of Canadian export is clearly shown in the following figures (in Can. \$ million):

Export	Total	To Great Britain To	United States
1939	1,897	331	336
1940	1,186	532	416
1941	1,638	702	573
1942	2,364	742	886
1943	2,971	1,033	1,149
1944	3,444	1,235	1,300

Canada supplied the U.S. with numerous strategic commodities in increasing quantities.

The assistance given by the Canadian government to Great Britain for British purchases in Canada was of great significance. The British deficit up to the end of 1940 amounted to Can. \$610,000,000; of that amount Can. \$250,000,000 was paid in gold (an amount approximately equivalent to the cost of material Canada had to buy in the U.S. in order to carry out British government contracts); the balance of Can. \$360,000,000 was covered by the repatriation of Canadian debts in sterling and the accumulation of sterling balances. From Jan. 1941 until March 1943 no more gold was shipped, the whole deficit being covered by repatriation of Canadian sterling debts and the accumulation of sterling balances. This procedure was facilitated by an agreement made in April 1941 between Canada-which did not accept lend-lease for itselfand the U.S., whereby Canada's U.S. purchases of component parts for use in carrying out British contracts in Canada would be supplied under the Lend-Lease act on United Kingdom account.

The financing of Great Britain's war expenditure in Canada was as follows (in Can. \$ million):

		4 years				
Financial Years	1940	1941	1942	1943	1944	1940-1943
Repatriation of						
securities	79	181	365	72		697
Accumulation of						
sterling balances	16	190	687			
Loan to British						
government				700		700
Gift to British						
government				1,000	1,000	

In 1943 the Canadian government appropriated Can. \$1,000,000,000 for mutual aid to cover deliveries of war material to Great Britain and other members of the United Nations. Canada's total aid to the United Nations during the war was estimated at \$4,500,000,000; \$1,700,000,000 as mutual aid (including \$1,442,000,000 to Great Britain); \$700,000,000 noninterest-bearing loan to Great Britain in 1942; \$1,000,000,000 as an outright gift to Great Britain in 1943 and 1944, \$800,000,000 repatriation of British-owned Canadian securities; and the refunding of

British expenditure in munition plants in Canada to the extent of \$200,000,000. One-third of the total assistance was in the form of loans and repatriations, while two-thirds were outright contributions.

Tentative estimates by the Foreign Exchange Control board placed foreign investment in Canada at the end of 1945 at \$6,700,000,000, against \$6,900,000,000 in 1939. While Great Britain's investment dropped by \$958,000,000 to \$1,500,000,000, U.S. investment rose \$735,000,000 to \$4,900,000,000.

At the end of the war the technical position of the Canadian currency was good. Canada was able to grant substantial assistance to Great Britain and to reduce its foreign indebtedness toward Great Britain. Its expanded production placed Canada in the position of a potential creditor nation.

Latin America.—The currency situation of some of the Latin-American countries was not very stable before the outbreak of World War II. The first year of the war greatly disturbed the trade of Latin-American countries with Europe, causing further difficulties to their monetary conditions. This situation, however, soon improved. Great Britain increased its purchases in these countries; of decisive importance, however, were the steadily mounting purchases of many strategic commodities by the U.S. When the U.S. became involved in the war, the majority of Latin-American countries mobilized their economic resources and supplied the U.S. with a large amount of raw materials and with foodstuffs. Latin America achieved a substantial export surplus in its cash trade with the U.S., which for the four years 1941–44 amounted to \$1,612,000,000.

The gold and dollar reserves of the Latin-American countries increased substantially, as follows (in millions of dollars):

	Dec. 1939	Dec. 1944	Aug. 194	45
Argentina	431		1,111	
Brazil	40	•	352	
Chile	30		82	
Colombia	21		104	
Cuba	1		176

Such development, of course, strengthened the technical position of the currencies concerned. Unfortunately, the great export surplus was accompanied by a substantial increase of domestic purchasing power which initiated an inflationary rise of prices in a number of countries.

In spite of the strongly improved balance of payments, exchange restrictions were maintained in most of Latin America. Only Mexico, Cuba, Costa Rica, Guatemala, Haiti, Panama and, until 1945, Peru, remained without exchange control. Although exchange restrictions were liberalized in most countries, the practice of multiple exchange rates was retained in some of them.

As a whole, the monetary position of Latin America was stronger at the end of the war than in 1939. The countries held largely increased gold reserves in addition to also increased dollar and sterling balances. Some of them, as Argentina and Brazil, repatriated securities owned by Great Britain.

The development of the exchange rates is indicated by Table IV, which shows that a relatively greater stability

*Prior to Nov. 1, 1942, the official designation of the Brazilian currency was milreis.

prevailed in the exchange rate of the Latin-American countries during the war years than in the period preceding them.

As a result of the improved balance of payments position, Argentina in July 1941 abolished its exchange control office and also the permit system for a number of commodities, usually comprising about 80% of its imports. At the end of 1940 a triangular payments agreement was arranged between Argentina, Paraguay and Great Britain, which made it possible for Paraguay to obtain Argentine pesos in return for sterling balances. In March 1942 an agreement had been reached with Great Britain to invest the excess sterling in repatriating Argentine bonds in Great Britain, chiefly the Conversion Bond Issue of 1934, the "créditos" and "cedulas" and some railway bonds aggregating together $f_{4,100,000}$. In view of a strong capital influx from the U.S., it was required in 1942 to register all foreign securities and to deposit dollar notes with the central bank. The free market rate of dollar exchange had been fairly stable at a level three per cent above that of 1940. The "bid" rate on foreign currencies at a substantially higher level than the free market rate was applied only to luxury goods. The agreements with the U.S. treasury department regarding \$50,000,000 and \$60,-000,000 loans remained unratified, owing to the improvement of the balance of payments.

In April 1943 the buying rate applicable to exports other than those classified as "regular" was reduced from pesos 421.82 to 390.02, corresponding to a decline in the free market rate from pesos 424.75 to 398. The free peso rate in April 1943 was the highest in the four-year period. In the same month the ministry of finance was authorized to control all foreign capital movements, and the inflow of floating funds seeking temporary refuge was prohibited. Productive capital for real long-term investments was granted entrance. A special decree provided for the repatriation of about £33 million of sterling obligations.

The exchange control was administered in a very liberal way. A special concession, made to British investors in 1944, reduced the special rate for financial remittances to Great Britain from 16.15 pesos to 14.15 pesos to £1.

Higher coffee prices under the Inter-American Coffee Agreement were responsible for easing the Brazilian exchange situation in 1941. Further helpful factors were the credits from the U.S. Export-Import bank and the inflow of refugee funds. In 1942 the milreis was supplanted by a new currency unit, the cruzeiro. The free rate of the dollar improved. The mounting accumulation of dollar and sterling balances provided the basis for a compensation agreement with Great Britain with respect to blocked cruzeiro balances. Under a new agreement

of Nov. 1943 it was possible to grant more favourable terms to creditors than previously. In Sept. 1943 the special free rate for dollars was reduced to 20.30 cruzeiros. The buying price of gold was reduced in 1944, and the rates for dollar and other currencies adjusted downward (20 cruzeiros to \$1), to emphasize the strength of the cruzeiro. The demand for foreign exchange increased, however, because of the settlement with the foreign

holders of Brazilian bonds. The exchange control included examination of essentiality of imports from all countries.

As early as 1940 the position of the Mexican peso had been strengthened by a heavy influx of capital which enabled the country to abstain from the introduction of exchange control. The peso was pegged to the U.S. dollar in the autumn of 1940 at the rate of pesos 4.85. In Nov. 1941 an agreement was concluded with the U.S., providing for the stabilization of the Mexican peso, for purchases of Mexican silver by the U.S. and for extensive Mexican road building with the financial assistance of the U.S. In 1943 a new \$40,000,000 defense loan was launched to finance the acquisition of exchange from the central bank for the redemption of foreign obligations. In April 1944 exports and imports of gold were prohibited, except by authority and through the Bank of Mexico.

In Bolivia, after a decline in exchange value in the spring of 1940, the currency was attached to the dollar at a rate Bs. 40=\$1 for necessary imports and at a compensation rate Bs. 55 for other imports. In June 1941 a single exchange rate of Bs. 46 to \$1 was established. Sufficient dollar exchange was available to meet all demands. In Feb. 1943 the official exchange rate was lowered to Bs. 42. Foreign exchange reserves increased because of greater export of tin and a loan from the Export-Import bank. But in 1944 the exchange rate in the curb market declined and in Aug. 1945 reached Bs. 60 per U.S. dollar against an average of 51.80 in 1944. The percentage of exchange to be delivered by tin exporters was increased in 1945 from 42% to 60% for exporters of highest grade ores. Percentages for exporters of other goods were also raised.

In Chile the official rate of the U.S. dollar remained unchanged in 1940. In November of that year an Anglo-Chilean payments agreement was concluded concerning all commercial and financial settlements between the two countries. In 1942 the powers of the Exchange Control commission were transferred to the central bank. The increasing exports to the U.S. in the following years created the problem of immobilizing the excess purchasing power. The central bank sold to the public dollar certificates of deposit represented by dollars purchased from the copper producing companies, with whom a special agreement with regard to the amount and rate of their dollars obtained from export was concluded. The National Foreign Trade council pursued a policy of preventing foreign exchange from being spent on nonessential imports. Attempts to induce importers to invest surplus pesos in dollar deposits at the central bank were not successful.

Exchange control was reinforced in Colombia in 1940. Imports were divided for exchange control purposes into four classes, with progressively less favourable rates. A

decline in imports resulted in making exchange available for all classes in the spring of 1942. To stabilize the prevailing exchange rate and to curb inflation, the central bank was empowered in June 1943 to sell nonnegotiable certificates of deposit bearing a two year maturity and an optional backing of gold or dollars. During the same years the rates applicable to import payments were lowered, and a special licence was needed for any new imports. The exchange control regime became very liberal.

In Venezuela, a strict control was imposed in 1940 on imports and foreign exchanges. After a credit was obtained from the National City bank of New York, the exchange quotas for imports were allowed to increase about 50%. A system of multiple rates was established. Thus, dollars originating from oil exports were bought by the authorities at Bs. 3.09, from other exports at Bs. 4.60, from coal and cattle shipments at Bs. 4.30. Exchange obtained from uncontrolled exports and other sources could be negotiated on the free market when the rate was strengthened in 1942. After 1942 the rate of 3.35 to \$1 was maintained in the exchange market, but the system of multiple exchange rates continued until 1945.

In Ecuador, exchange control was re-established in June 1940. In Dec. 1940 the dollar rate was fixed at 15 sucres and in June 1942 was lowered to sucres 14-\$1 in conjunction with a stabilization loan from the U.S. In Sept. 1943 the dollar buying rate was lowered to 13.50 sucres, and toward the end of 1944 to 13.40.

In Uruguay, the plentiful supply of dollar exchange in 1941 was reflected in the drop of the free rate to the lowest level in many years; that is, the official selling rate of peso 1.90. But unlike most other Latin-American countries, Uruguay evidenced a shortage of foreign exchange supply early in 1943. In the autumn of 1943 some "scarce" capital flowed into Uruguay from Argentina, thus easing the situation.

In Paraguay, the buying and selling rates for foreign currencies were held constant. The policy of limiting the amount of exchange available for the imports of luxury goods continued, exchange for these items ranging as high as 50% above the official rates. Thanks to the improvement of the exchange position, Paraguay was able to resume a partial service of its foreign debts in 1940.

The natural consequence of the Latin-American development during the war—increased export to the U.S., Canada and Great Britain, the impossibility of raising imports, and the various loans and investments by the U.S.—was the improvement of the balance of payments and of the foreign exchange position of most of the Latin-American nations.

The Far East.—The outbreak of the war with Japan in 1937 found China engaged in a long-term policy of stabilization. The monetary position was relatively strong as a result of the currency reform of Nov. 1935, which had introduced a sole legal tender currency in the form of notes issued by the four government banks. All silver coins had been withdrawn, and the sale of silver by the national government of China to the U.S. treasury had provided the government banks with substantial foreign exchange balances which enabled them to stabilize the exchange market. The war interrupted this stabilization process in its beginning. During the period 1937-41 the government had recourse to note issue for about two-thirds of the total expenditures; by the end of 1941 the note circulation of the government banks increased more than ten times. Because of its structure, China's economy showed the effects of inflation late in the war.

At the beginning of the war in July 1937, the Central

bank of China undertook to support the value of the national yuan at \$0.29 and 15.2d. by exchange operations in the open market.

In March 1938 a system of rationing and control for sale of foreign currencies at official rates was introduced. But it was not possible for the Central bank of China to enforce the exchange control because of the autonomous status enjoyed by the foreign banks in the Shanghai and other major markets. A system of free and official exchange rates was established. In spite of the support from the Chinese and British banks, the national yuan depreciated to \$0.05 in the free market for the middle of 1941. By this time China had used up the dollar balances acquired through the sale of silver and nearly exhausted the various credit facilities obtained by the U.S., British and Russian governments. The British arranged for a loan of £10 million; the U.S. loan amounted up to \$100,000,000.

On April 25, 1941, exchange agreements were signed between China, on the one hand, and the U.S. and Great Britain on the other. The agreement provided for the establishment by China of a stabilization fund, which was to be managed by a stabilization board set up by the Chinese government. This stabilization board began operations in Aug. 1941. The dollar rate was fixed 5510 cts. to the yuan. A system of licensing each individual transaction involving the expenditure of either U.S. dollars or sterling exchange was introduced. Fourteen licensed banks were authorized to provide dollar or sterling exchange at official rates for normal trade requirements.

A new situation arose at the end of 1941 and the beginning of 1942, when the advance of Japanese forces brought the activities of foreign banks and firms in the major markets to an end and cut all China's foreign trade relations.

The outbreak of war in the Pacific led to an increase of monetary assistance to the Chinese government. A \$500,-000,000 loan was granted by the U.S. stabilization fund and a credit of \$50,000,000 by the British government. In Feb. 1942 the Chungking government was able to abolish restrictions on money movements within the country and to free the export of currency, except for newly printed banknotes sent to ports of entry or interior, which required permission from the ministry of finance. The foreign exchange situation improved further because the U.S. supplied China with lend-lease, thus saving her dollar exchange, and Allied military disbursements began to expand substantially. The national government of China was even able to accumulate dollar balances, which grew in magnitude with increasing U.S. war activities in China. The official rate of the Chinese dollar was reduced in July 1942 to five cents.

Inflation proceeded at greater speed in 1943. Prices and note circulation had risen tremendously, yet the official rate Ch. \$20=U.S. \$1 was maintained with a special rate of 30-1 for diplomatic, educational, missionary and some other transfers. In May 1943 unlicensed exports of gold and silver were prohibited. To bolster the falling currency, \$200,000,000 in gold bullion was purchased from the U.S. with the part of the \$500,000,000 stabilization loan granted in 1942.

The monetary situation deteriorated further in 1944. The rapid rise of prices led to the abandonment of the official rate of \$0.05 as the basis for compensating the national government for currency and credits in national yuan made available to the U.S. army. Settlement of such advances was made subject to exchange rates and other conditions to be agreed upon from time to time between

the treasuries of the two countries.

In June 1944 the price of the U.S. dollar reached Ch. \$220. The index of wholesale prices of domestic commodities in the spring of 1945 reached a figure of more than 1,200 times the 1937 level and in August 1,900 times. The exchange shop buying rate for dollars went up to Ch. \$1,200. The currency in circulation reached approximately a level between 500,000,000,000 and 600,000,000,000 of national yuan by the end of the war.

The end of the war aggravated rather than eased monetary chaos in China. The movement of military forces and population increased the demand for currency and the whole situation was one of a runaway inflation.

Japan and the Yen Bloc.—The opening of hostilities in China in 1937 found Japan already committed to a war economy, the financial aspects of which were a controlled depreciation of the exchange rate and a managed use of central bank credit. During the China War and the early period of the Pacific War, the Japanese government financed itself through the issue of long-term loans which, to a large extent, found their way into the market. In the latter part of the Pacific War, a floating debt and contingent liabilities were growing faster than the capacity of the market to absorb new bond issues. The government even had to require banks and other financial institutions to invest fixed quotas of their expanding volume of deposits in government bonds. Compulsory investment of certain corporate funds in government bonds was also introduced.

The main feature of the Japanese occupation of China was the dismemberment of China into separate administrative zones, each having its own financial organization and currency, distinguished mainly by the degree of integration with the economic, monetary and financial system of Japan. In 1937, the Bank of Mongolia was organized as the note-issue institution for Inner Mongolia. In 1938 the Federal Reserve bank of China in Peiping was created as the note issue institution for northern China. In 1941 the national government of China in Nanking organized the Central Reserve bank of China as the note institution of central and southern China. In fixing the official value of currencies of the yen bloc, Japanese authorities were guided by political considerations. A system of strict exchange control was maintained not only between occupied China and the Japanese empire but also between zones in occupied China; in addition, the system of trade barriers was erected. The currencies of occupied China were legally treated as foreign currencies in the empire. The Japanese-dominated banks of issue in occupied China had to provide notes, especially for the currency needs of the Japanese army and had to finance the budgetary deficits of the local government. Lack of statistical information made it impossible to determine the economic and financial exploitation of occupied China by Japan. Japanese authorities imposed levies of contribution upon the Japanese-dominated governments, issued military notes, and acquired local currency from the central banks mentioned before. Military yens were withdrawn as soon as the currencies issued by the newly created central banks were accepted by the population. The central banks were compensated by the Japanese government with yen credits on the books of the Bank of Japan in amounts equal to those of military yen withdrawn.

The Japanese yen was pegged in Oct. 1939 to the U.S. dollar at a rate of Yen 100=\$23.44, which represented a depreciation of 14%, or to the same extent as the official sterling rate. To stabilize the yen-sterling exchange, all

forward exchange transactions in sterling and sterling-area currencies had to be centralized beginning with June 1, 1941, in a collective account maintained by the Yokohama Specie bank. On July 1, 1941, this foreign exchange concentration system was extended to include operations in the U.S. dollar and currencies of 11 other nonsterling countries. This measure centralized the whole body of foreign exchange transactions between the yen group and other currencies. Any losses resulting from transactions over this account were covered by a government guarantee of yen 500 million, any profits arising being credited to the governments.

In retaliation for the Allied freezing of Japanese assets abroad, Japan announced a freezing ordinance on July 26, 1941. Under it the assets of U.S. and British nationals were immediately frozen. The exchange control system had already been tightened prior to this measure in order to provide exchange for imports from non-yen countries. In Feb. 1941 the government was given authority to order Japanese nationals to sell their foreign assets.

On Dec. 29, 1941, Japanese exchange control was simplified, and the independence of the yen from the U.S. and British currencies was established. Exchange rates were to be fixed autonomously by the ministry of finance on the basis of the yen currency. No essential alteration, however, was made in the range of the existing exchange rates. For the reichsmark a rate of RM. 170.50=Yen 100 and for the Swiss franc a rate of Sw. fr. 98.90=Yen 100 was fixed. This corresponded to Yen 100=\$23.40 and Yen 1=15.2d.

Settlements with countries outside the yen area were no longer to be made by payments in dollars and sterlings. Payments were more and more effected through clearings and transfer of yen balances. Gold kept its importance as an instrument for maintaining the credit of the yen currency in the "co-prosperity sphere."

Throughout its field of conquest, Japan replaced the provincial or colonial currencies with the military yen (called "gumpyo" in Japanese) at rates established by Tokyo. The military yen was first issued in China in various denominations expressed in yen. In other areas the gumpyo was issued in the currency of the occupied country,—in the Philippines a military peso, in the Dutch East Indies a military guilder. In these cases the gumpyo was at par with the local currency but varied in relation to the Japanese yen. In the Philippines \$1=2 yen, in Thailand the baht was defined as 1 baht=1,551 yen. In April 1942 this ratio was changed to 1 yen. In Indo-China, piastros 100 were 97.60 yen.

In April 1942 it was ordered that all currencies circulating in the Philippines as well as in the Dutch East Indies be replaced by notes issued by banks and similar institutions.

In Hong Kong the value of silver dollars was fixed in relation 2-1 to the military yen. The Shanghai dollar had been severed from its dollar and sterling links in Jan. 1942.

In the territory dominated by the puppet Nanking government, the Chungking yuan was finally displaced by Japanese authorities. In 1941 the rates had been set at 1 Chungking yuan=1 Nanking yuan=1/4 of 1 Japanese military yen. In March 1942 a rate of 100 Chungking yuan=77 Nanking yuan was proclaimed, and in May 1942 a rate of 2 Ch. yuan=1 Nanking yuan was fixed. Soon afterward the Chungking yuan was prohibited,

Since the beginning of 1942 Japan had endeavoured to organize a yen area comprising the whole far east. The main instrument of this policy was the military currency, the gumpyo. After a short time, this currency was put on a par with the Japanese yen, which involved an in-

direct attachment of all local currencies to the yen at a rate of 1: 1. This de facto introduction of a new parity with the yen amounted to a depreciation of the local currencies. The rupee in Burma was depreciated 22%; the baht in Thailand, 37%; the Straits dollar in British Malaya, Borneo and Sarawak, 50%; the peso in the Philippines, 53% and the guilder in the Dutch East Indies, 56%.

These rates were settled to give a high purchasing power to the Japanese yen. In China proper the military yen, the Nanking and Peiping yuan were also attached to the Japanese yen. A kind of monetary warfare was conducted between these currencies and the Chinese yuan. The Central bank of Nanking received support from the Japanese government in several ways.

The network of fixed exchange rates between the different parts of the yen bloc had been completed in 1943. The rates did not, however, correspond to the relative purchasing power of the different currencies. Various arrangements for price equalization were introduced. The foreign exchange business previously carried out by the Yokohama Specie bank was transferred to the Bank of Japan. The currencies of the conquered countries were relatively more depreciated than were the currencies of the German sphere. Conversion of these satellite currencies into Japanese yen was permitted only in exceptional cases to limited amounts, a rule also applied to gumpyo circulating in these areas.

The price development in 1943 and 1944 increased the disparities between the intrinsic values of different currencies so that the existing exchange rates became more and more fictitious. But with trade put on a barter basis, the difficulties arising from the unequal increases in prices of the different countries were somewhat overcome. Between Japan and Nanking China the policy of applying different rates to different categories of transactions was introduced in 1942, but abolished as too complicated in the spring of 1943. A uniform rate of yen 18-yuan 100 was fixed, and trade became a monopoly of the Barter Trading corporation. A similar system was used to trade with other areas under Japanese domination. Steps were also taken to give the Nanking yuan a greater recognition as an "international currency." The use of military yuan was suppressed in the area of the Nanking yuan.

The strain upon the Japanese financial situation was evident from the figures of operations of the Bank of Japan. By the end of the war, the bank's issue of notes reached 28,460,000,000 yen against 2,600,000,000 in 1941. The outstanding government bonds were reported at about 120,ooo,ooo,ooo yen, a floating debt at 40,000,000,000 yen and contingent liabilities of about \$60,000,000,000. At the beginning of the China War in 1937, the long-term government debt was less than 10,000,000,000 yen, the floating debt 500,000,000 yen. Yet despite the inflationary expansion of credit and currency, the Japanese government was apparently able to control prices and check the inflationary trend up to the end of the war. The Tokyo retail prices stood in Nov. 1944 at 202 (July 1937-100). A system of rigid controls prevented potential inflation from having its full effect on the marketing of goods.

No figures were available at the end of 1946 concerning the contribution which Japan extracted from the "coprosperity sphere" for its war needs. The three principal procedures to obtain the necessary means for purchasing goods and meeting military requirements were the levy of contribution upon the Japano-dominated governments, the issuance of military notes, and the acquisition of local currency from the Japanese dominated banks of issue. (Compared with figures of circulation at the end of 1941,

the note issue of the Central Reserve bank of China increased up to Aug. 1945 by 150,000%, of the Federal Reserve bank of China by 3,000% and of the Bank of Monchou by 530%.)

Occupied China achieved an export surplus with Japan and accumulated short-term balances yen in Tokyo, which were believed to exceed the original value of the Japanese long-term investments made in China before and during the war.

India and the Middle East.-In India and throughout the middle east, the greater part of which belonged to the sterling bloc, sterling assets had already begun to accumulate in 1940. Allied war expenditures in this part of the world were increasing first as a result of the campaigns in Africa, then of the war against Japan. In some countries they were connected with the shipping of lend-lease supplies to the soviet union. The sterling balances were used for the repayment and repatriation of debts in Great Britain; a great part of these balances was purchased by the central banks. The increase of the sterling assets resulted in an expansion of the note circulation. The spending power increased, yet at the same time the supply of goods was lacking as the domestic production, although expanded, was inadequate and the imports fell below the prewar level. Under these conditions inflationary pressure arose in all countries concerned, with prices steadily mounting. The undeveloped credit and financial organization could not be used properly to check this pressure.

A Middle East Financial conference, attended by experts representing the middle east governments as well as by representatives of India and the British and U.S. treasuries, met in Cairo, Egypt, in April 1944. A number of resolutions were drawn up outlining the steps which should be taken to prevent the spread of inflation. The conference emphasized that all currencies in the middle east were backed fully by gold or foreign exchange assets.

In India, where the note circulation rose from rupees 2,000,000,000 in 1939 to nearly 9,000,000,000 by the beginning of 1944, Indian peasants were not able to buy manufactured articles or to obtain gold or silver in exchange for their products and, therefore, were not inclined to market their produce. The Indian government decided on the recommendation of a specially appointed committee to release gold on the Bombay market. The Indian Reserve bank was prepared to sell 35,000 oz. or 100,000 tolas daily. The sale of gold was expected to act as a check on inflation; the peasants would sell more of their products, the gold sales would absorb monetary purchasing power from the market, and the sales would help hold down the price of gold quoted in the open market. The gold price in India had begun to rise even at the end of 1941, attaining a maximum of more than double the parity price of the rupee (Rs. 80/12 per total-about £16 per oz.) in May 1943. The sales of gold did not affect the reserves of the Indian Reserve bank; gold from South Africa was sold under arrangement with the British government. Later, under arrangement with the U.S. government, gold was shipped from the U.S.

The price of gold went down to 71–72 rupees in June 1943, and with the Allied military victories fell to Rs. 62/8 in Nov. 1944, the lowest point. At the end of Dec. 1944 the price was again Rs. 74/12; in March 1945, Rs. 74/8. After the end of the Japanese War, the price dropped to Rs. 63/4, but recovered quickly and reached Rs. 8/14 in Dec. 1945.

In April 1945 the U.S. treasury terminated its participa-

tion in the program of selling gold in India, Egypt and Iran. The military need for currencies of these countries had been met completely by that time.

Silver was also sold on official account in India, the daily offering being raised from 100 to 200 bans in the autumn of 1944. The highest price for 100 tolas was Rs. 140. In the summer of 1944 India received 100,000,000 oz. as lendlease from the U.S., to be used exclusively for coinage.

In Iran the increase in the holdings of sterling resulting from the expenditures of the British forces induced the authorities to lower the exchange rate from rials 174 to 140= £1 and from rials 45 to 35=\$1 in Sept. 1941. The increased import of gold into Iran made it possible to replace the Persian crown jewels with gold as backing of the note circulation; the amount involved equalled £2,000,000. Yet in spite of the influx of gold, restrictions were placed on the sale of dollar exchange—other exchange remaining free—effective June 1, 1944. The sales were chiefly limited to bona fide commercial transactions for imports from the U.S. The sale of dollars at the official rate was virtually suspended in June 1945, and the free market rate soon reached 65 rials to \$1.

Gold was also sold in Egypt where the note circulation reached £E. 96 million at the end of 1943 as against £E. 26,000,000 in 1939. For some time the price of gold in Cairo followed the price movements in Bombay rather closely. At the beginning of 1944 the gold price at Alexandria reached nearly £16 per oz. The Egyptian government changed its policy in June 1944, suspending the official gold sales.

The open market price for gold in Alexandria slumped violently when Germany collapsed. This decline carried the price down from 184 piastros per dirkem at the end of April 1945 to 162 piastros on May 10. Yet in Aug. 1945 the price reached 193 piastros (£19 s.10). These gold transactions were, of course, more spectacular than large, and the premia quoted in gold compared with exchange parities were no true indices of the value of the middle east currencies.

The attempt to check inflation by sales of gold did not succeed, though it might have had some local and temporary results. Although the amount of gold sold to the public in different countries was not known, it was probably rather small compared with the amount of the newly created spending power plus the degree of inflationary pressure existing at the time when the program of gold sales started.

Allied Military Currencies.—The military occupation of territories in North Africa in 1942–43 created new currency problems. The immediate currency needs of the U.S. and British forces in the liberated area were supplied by the issue of spearhead currencies, for which new, unified occupation money was substituted later. The spearhead currency of the U.S., first used in North Africa and during 1943 in the Italian theatre, was the yellow-seal dollar in denominations \$1, \$5 and \$10. The British authorities issued a special spearhead pound note. The conversion rate between these two currencies was \$4-£1.

In 1943 a new Allied military lira was jointly issued as legal tender and circulated at par with the local lire. The official rate of both liras was 100 lire=\$1, 400 lire=£1. The North African franc was valued in 1942 at 75 fr.=\$1 (300 fr.=£1) and was appreciated in Feb. 1943 to 50 fr.=\$1 (200 fr.=£1). The French Equatorial Africa franc and that of all Free French colonies maintained its value of 176.6 fr.=£1.

For the invasion of France in June 1944 the Allied military forces were provided with specially printed notes "francs tricolores." This currency was freely interchangeable for the franc currency of the Bank of France. By an agreement signed in Aug. 1944 between the French government and the U.S. and the British government, the French government took over responsibility for the "tricolor" military notes issued in France by the U.S. and British authorities.

In Belgium and Holland the notes required by the military authorities were provided by the government and were expressed in local currency. The rate of exchange was fixed for 176.5 Belg. fr.= \pounds 1 and 10.691 gulden= \pounds 1.

The actual currency taken into Germany by the Allied armies were the military authority notes printed in Britain. The Allied high command fixed rates of 10 marks to the dollar and 40 marks to the pound. After the surrender in May 1945 "Allied Military Mark Notes" were put into circulation in all occupied zones.

In countries where the soviet army was primarily responsible, rates of exchange in relation to the rouble were fixed. Those rates were as follows:

	1 Re	ouble	Percentage change		
Bulgaria	Leva	15	+ 1		
Rumania	Lei	100	 74		
Hungary	Pengo	2.50	62		
Poland '	Zloty	1.	0		
Czechoslovakia	Kč.	5.50	, — 1		
Austria	Sch.	2	50		

*Calculated against pre-war rates via the U.S. dollar \$1=roubles 5.30.

(From the 15th Annual Report of the Bank for International Settlements.)

Special Hawaiian series of U.S. currency, consisting of U.S. silver certificates and federal reserve notes with the overprint "Hawaii" and originally introduced in Hawaii in July 1942, were taken into central Pacific strongholds by the U.S. armed forces in Feb. 1944. These notes were destined for the use of the armed forces and of the inhabitants of these islands.

The rate of exchange established for liberated islands in the central Pacific was 20 Japanese military yen to one Hawaiian dollar, or 20% of the prewar yen value. In Japan the exchange rate of the Bank of Japan yen and sen notes, when used as currency by the Allied forces, was fixed in Sept. 1945 at yen 15=\$1 as compared with a prewar rate of yen 4.23 to the dollar.

* * *

At the end of World War II, the U.S. dollar remained stable in terms of its gold value and became a key currency for monetary reconstruction. The currencies of the members of the sterling area also maintained their stability. The monetary position of the neutral countries in Europe and of nearly all Latin-American countries improved. On the other hand, the currencies of the European nations occupied by the axis and of the far eastern countries occupied by Japan were mostly in disorder, and speedy action was required. China was in the midst of a run-away inflation.

The international capital movements during the war were represented by three big streams of capital. By far the largest were the lend-lease supplies of the U.S. In this category belonged also the Canadian mutual aid, an outright gift to Great Britain, and the British lend-lease to the soviet union and some of her allies.

A second group of international capital movements were the supplies and services to Great Britain by the members of the sterling area and some other countries. These sup-

plies led to accumulated sterling balances which surpassed the total of three thousand million pounds. Great Britain was faced with the task of working out the settlement of these balances.

Finally, Germany required huge contributions from most European countries amounting to more than 130,000,000,000,000 marks.

The war brought about a change in the creditor and debtor position of a number of countries. The greatest change occurred in the position of Great Britain.

Exchange control remained throughout the war as a common instrument used to help in maintaining the stability of the exchange rates. It is clear, however, that many of the rates as they existed at the end of the war would need some adjustment. They were out of line if the level of prices and wages was taken into account. Furthermore, it should not be forgotten that the end of the war found practically the whole world in a situation of open or potential inflation.

Postwar Developments

At the end of World War II orderly monetary conditions existed only in the western hemisphere, in most countries of the sterling bloc and in the European neutral countries. On the one remaining free great exchange market, in New York, only the exchanges of the Latin-American countries, Canada, the countries of the sterling bloc, Sweden, Switzerland, and irregularly the exchange of Spain and Portugal, were quoted.

With the liberation of the European countries and the defeat of Germany, an urgent task of monetary reconstruction arose in all nations which had been under German domination. The wartime controls, introduced by Germany, could be maintained only for a limited time and only in some countries; the danger that potential inflation would break into open inflation existed everywhere. The legacy of the nazi domination in the monetary field was certainly not small. In the countries which had been included in the Japanese co-prosperity sphere, immediate measures were also necessary to establish monetary order.

In the European countries, the task of monetary reconstruction was very difficult. The nations had to restore an orderly monetary system in an economy working mostly at low capacity while the accumulated purchasing power was everywhere great. The countries needed to replenish their stock of raw materials, renew the worn out industrial machinery, and repair the damaged transportation system. The demand for imports was enormous and that of foreign exchange considerable. The western European countries-Belgium, Holland, France and Norway-had been able to save a substantial part of their prewar gold reserve and dollar assets, but little of their foreign exchange reserve remained to Poland, Czechoslovakia, Yugoslavia and Greece. The monetary problems of the defeated satellite nations-Austria, Hungary, Rumania and Bulgaria -likewise had to be settled. In all countries the need of foreign assistance was great; even France and Holland required foreign loans in spite of their substantial foreign assets.

The changes in currency rates which took place during the war are illustrated by Table V. After the end of the war the rates of some currencies were further devaluated.

Before the liberated countries were able to establish new rates of exchange, they had to clean house after the German occupation. It was necessary to call in the outstanding currency in exchange for a new issue. By the end of 1945 currency conversion had been completed in Austria, Belgium, Czechoslovakia, Denmark, France, Holland, Nor-

(From the 15th Annual Report of the Bank for International Settlements.)

way and Yugoslavia. All outstanding currency, except small denominations, was called in and replaced by a new issue. The conversion ratio was mostly one for one.

In a number of countries the conversion was coupled with measures taken to block excess purchasing power. In view of the unsettled domestic economic situation and very unstable international economic relations, the task of fixing new exchange rates was very difficult. A very rigid price and wage control, rationing, limitations of public spending and a strict exchange control—all these measures were required in order to check inflation, but even they could not help without a speedy revival of production. Generally speaking, the danger of inflation was checked more efficiently in western than in eastern Europe.

As early as Nov. 1944 Belgium had taken measures to check inflation by withdrawing from circulation a substantial part of notes and by blocking at the same time 90% of all deposit accounts. In an agreement with Great Britain signed in Oct. 1944, a rate of 176.5 Belg. fr. to the pound was fixed, corresponding to the rate of 43.827 Belg. fr. to the dollar. The rate of the Dutch florin in relation to the pound was provisionally fixed in Sept. 1944 at Fr. 10.691-£1, and was then confirmed in the Anglo-Dutch payment agreement of Sept. 1945. In Holland, too, the total note circulation was reduced to about one-half and bank balances were blocked. France introduced a new rate of 119 francs instead of 50 francs to the dollar on Dec. 23, 1945.

In Denmark a rate of £1=D. Kr. 19.36 and \$1=D. Kr. 4.81 was fixed in Aug. 1945. The rate of the Norwegian crown was fixed in May 1945 to £1=N. Kr. 20, and \$1=N. Kr. 4.96. In Finland the rate of exchange was devaluated several times in 1945 and fixed in Oct. 1945 to FM. 547=£1 or FM. 136=\$1.

In Czechoslovakia a new currency had to be introduced to replace the protectorate and the Slovak koruna, the German mark and the Hungarian pengö. This was done in Oct. 1945; at the same time the amount of notes in circulation was greatly reduced and all deposits were blocked. The rate of the Czechoslovak currency was fixed at $£1 = K\tilde{c}$ 201.50 and at $$1 = K\tilde{c}$ 50.

In Yugoslavia seven different currencies were circulating at the time of liberation. They were exchanged for a new unit in Sept. 1945, the D.F.Y. dinar at the following rates: 5 D.F.Y.—100 Serbian dinars; 2.50 D.F.Y.—100 Croatian Kunas; 10 D.F.Y.—100 Bulgarian levas; 2.50 D.F.Y.—100 Albanian francs; 50 D.F.Y.—100 Italian lire; 100 D.F.Y.—100 Hungarian pengö. In Poland, the rate of zloty 100—\$1 was established.

Greece went through a galloping inflation. An attempt to stabilize the Greek currency was made in Oct. 1944 when one new drachma was issued for every 50,000,000,000 old notes and the rate was fixed £1 = 600 new drachmas. In June 1945 a new rate of Dr. 2,000 = £1 was established. But even this rate could not be maintained; the British gold sovereign was bought at 28,000 drachmas. In Jan. 1946 an agreement was concluded in London setting up a stabilization fund with £25,000,000 in sterling assets. The unsettled economic and political situation made currency stabilization temporarily impossible.

Hungary also experienced an acute inflation which surpassed by far even the German inflation of 1923. The pengö currency was practically repudiated and a new unit, the florint, was introduced in Aug. 1946 at 11.5 florint to \$1.

In the far east a very unsettled monetary situation was left as the aftermath of the Japanese occupation. In Shanghai, the Philippines, Burma and Malaya, the notes issued by the Japanese monetary authorities were demonetized. The dollar of the Straits Settlements was issued again, the rate being determined at the prewar parity of $1=f_1$, 8s., od. In Hong Kong the prewar dollar currency was restored; in Burma the prewar rupee; in the Philippines the peso, and in the Dutch East Indies the guilder. The exchange rate of the guilder was fixed in the Anglo-Dutch monetary agreement at the old rate fl. $7.60=f_1$, while the rate of the Dutch gulden was determined at Fl. $10.691=f_1$.

The end of the war increased rather than eased the monetary chaos in China. At the beginning of Aug. 1945 gold was quoted on the market at 180,000–190,000 Chinese dollars per tael, which caused the authorities in Chungking to raise the official price to \$175,000. The exchangeshop buying rate for dollars was at that time around Ch.N. \$1,400. The wholesale prices at the end of July 1945 were 1,900 times as high as in 1936.

The pressing problem was to reintroduce the national yuan in former Japanese occupied territories. In fixing the rates of conversion, the national government undervalued the Japanese-dominated currencies in relation to the national yuan, because the inflation in other zones, with the exception of central China, had not reached the degree of the inflation in Free China.

Regulations were issued in Shanghai for a limited conversion of central reserve currency up to 100,000 central reserve yuan daily, into national yuan, the rate being 200 central reserve yuan to 1 national yuan. In Nov. 1945 a program was announced for the conversion of federal reserve currency into national yuan, to be carried out between Jan. 4 and April 13, 1946, at which date federal reserve notes would cease to be valid. In northern China the local currency was maintained in circulation at the rate of 5 federal reserve yuan to 1 national yuan. Special yuan scups were temporarily issued for Formosa and Manchuria, and their rate was fixed at 1:1 between the special yuan scup and the Manchurian as well as the Formosan yuan.

In Shanghai a special exchange rate of 500 national yuan to the dollar for overseas remittances to China was introduced, which was used also for exchange transactions of the U.S. forces and civilian agencies. It represented a great undervaluation of the U.S. dollar in view of steadily mounting inflation. The U.S. dollar was widely used, especially for financial transactions, and this fact proved to be an obstacle to the reintroduction of a national currency.

A new attempt to stabilize the Chinese dollar was made in July 1946 with the rate of Ch.N. \$3,350-U.S. \$1. As in some of the European countries, the unsettled political and economic conditions in China made monetary reconstruction extremely difficult.

In Japan, the new rate of $\pounds 1$ to 15 yen was established; it represented a 67% depreciation of the yen from its 1937 value. The new exchange rate, considered by many as overvaluing the yen, acted as a deterrent to spending by the Allied forces.

The sterling bloc consisted at the end of the war of the whole British commonwealth—except Canada and Newfoundland—British mandated territories, British protectorates and protected states, Egypt, the Anglo-Egyptian Sudan, Iraq and the Faroe Islands. The organization formed for pooling of dollars and other hard currencies continued to work.

The pressure to convert part of the sterling balances into dollars, which was exercised by their holders, was steadily growing. An agreement with Egypt assured that country of \$40,000,000 for its needs in 1945 and 1946. Iraq obtained about \$4,000,000 for its purchases in 1945.

Exchange control in Great Britain was further simplified. The treasury's buying price of gold was increased in June 1945 from 168s. per fine oz. to 172s. 3d. per fine oz.

Great Britain arranged clearing and payment agreements with most European countries, which was helpful in promoting trade and proved also a stabilizing factor on the exchange markets. These agreements extended practically the working sphere of the sterling area. The first agreement was signed with Belgium in Oct. 1944 fixing the rate of the Belgian franc. Each government granted to the other overdraft facilities to the amount of £5,000,000, the balances over this amount to be settled in gold at a price to be determined in each case separately. In March 1945 the Anglo-Swedish monetary agreement was signed, the rate being fixed at 16.90 Kr. to the pound. The agreement envisaged a maximum accumulation of sterling of about £40,000,000 over a period of about two years. Sweden could use its sterling holdings to finance imports from all members of the sterling area.

An agreement with Denmark was signed in Aug. 1945 which followed closely the pattern of the Swedish agreement. The rate was fixed at Kr. 19.34 to the pound (only a fraction over the pre-invasion level). The Anglo-Norwegian monetary pact concluded in Nov. 1945 fixed its rate at Kr. 20 to the pound. The Anglo-Dutch agreement signed in Nov. 1945 fixed the rate at 10.691 guilder to the pound. It provided for mutual overdraft facilities of £5,000,000.

A financial agreement concluded with France in March 1945 arranged a payment organization in order to facilitate the resumption of trade relations between the sterling and franc areas. Great Britain was to open a credit of £100,000,000 to France and France a credit of Fr. 20,000,000,000 to Great Britain. By the end of Oct. 1945 the credit for French purchases in the sterling area was exhausted; French purchases stood to British purchases 10:1. France tightened up its exchange control and required that private holdings of foreign exchange be surrendered to the French authorities. Great Britain in its agreement with France promised to disclose to the French authorities private French accounts held in Great Britain. A new comprehensive British-French payment agreement was concluded in Sept. 1946.

A clearing agreement signed in Nov. 1945 with Czecho-slovakia fixed the rate at Kč. 201.5 to the pound and limited the overdraft facilities to £1,000,000 and Kč. 200,000.

ooo. Payment agreements were arranged by Great Britain also with Turkey (May 1945), Finland (Aug. 1945) and Switzerland.

Other countries in Europe also making bilateral payment agreement included: France with Belgium, Sweden, Switzerland and Argentina; Switzerland with Italy, Czechoslovakia and Turkey; and Sweden with Poland, Belgium and Norway.

These payment agreements and clearings became the first instrument helpful in rebuilding international trade, although in the beginning only in the way of bilateral arrangements. Because of the British position in international trade and of the stabilizing influence effected by the pound of sterling, the agreements arranged with Great Britain were the most important.

International Fund and Bank.—While many countries were engaged in the urgent task of rebuilding their currencies, plans were under way to organize an international monetary co-operation and to put it on a permanent basis. The Bretton Woods conference of the United Nations in July 1944 agreed to establish an International Monetary Fund and an international Bank for Reconstruction and Development (qq.v.). These organizations were constituted at Savannah, Ga., in March 1946. The soviet union did not become a member of the International Monetary fund, and the Bank for Reconstruction and Development, yet this fact was not expected to interfere with the functioning of the fund. The monetary system of the soviet union was different from that of the other nations; the rouble was not being used for international transactions.

The chief objective of the International Monetary Fund was "to promote international monetary co-operation through a permanent institution which provides the machinery for consultation and collaboration on international monetary problems" and to "promote exchange stability, to maintain orderly exchange arrangements among members, and to avoid competitive exchange depreciation." Detailed provisions of the agreement dealt with the changes in the exchange rate of the members. The changing of exchange rates ceased to be a sovereign right of each member alone, being now subject to conditions stipulated in the agreement.

While, in the postwar transition period, restrictions on payment and transfer for current international transactions were admitted, any member still retaining such restrictions five years after the fund began operations was required to consult the fund concerning their further retention.

The International Monetary fund represented an attempt to establish an international monetary organization, an international standard, which would be maintained by the permanent co-operation of all member nations. The par value of the currencies of the members was to be expressed in terms of gold as a common denominator or in terms of the U.S. dollar of the weight and fineness in effect on July 1, 1944.

The U.S. declared in Sept. 1946 that it would maintain the value 1 oz. fine gold=\$35; and Great Britain declared that it would maintain the ratio of the pound to dollar as it existed in Sept. 1946.

It was evident from the beginning, however, that Great Britain, her international financial position having been greatly weakened, would probably be able to adhere to the fund and its commitments only if she could obtain special assistance from the U.S. Therefore the Anglo-U.S. credit agreement, signed in Washington, D.C., on Dec. 6, 1945, and approved by congress in July 1946, had great significance for the future exchange and monetary policy

not of Great Britain alone. Great Britain received a line of credit of \$3,750,000,000, which might be drawn upon at any time until Dec. 31, 1951. In connection with this agreement, Great Britain took upon itself the obligation of abolishing the dollar pool arrangement of the sterling bloc not later than one year after the effective date of this credit arrangement. Each member of the sterling area was to have its current sterling and dollar receipts at its free disposal for current transactions everywhere, and any discrimination arising from the sterling area dollar pool was to be entirely removed. Moreover, after the effective date of this agreement, Great Britain was not to apply exchange control in such a manner as to restrict payments or transfers in respect to products of the U.S. permitted to be imported into Great Britain, or other current transactions between the two countries. Finally, the U.S. and Great Britain agreed that not later than one year after the effective date of this agreement they would impose no restrictions on payments and transfers for current obligations.

* *

The United States assisted in the first postwar year in improving the foreign exchange situation of several countries by loans granted by the Export-Import bank, to be used for purchases in the U.S. Such loans were given to France, the Netherlands, Belgium, Norway, Finland, Denmark and Poland. Another help consisted in the sale on credit of U.S. surplus abroad, which often represented goods very important for the economic rehabilitation of the European countries.

The frozen assets of the United Nations in the U.S. were being freed, and these amounts could be used for purchases in the U.S. or elsewhere. It should be noted that at the end of the war foreign countries held in the United States in the shape of earmarked gold, bank balances and dollar securities the total of about \$15,000,000,000—an increase of some \$9,000,000,000 since the end of 1938. In addition, the gold reserves of countries other than the U.S. increased during the war by some \$2,500,000,000.

The credits granted by the U.S. until Sept. 1946, the credit possibilities of the Bank of Reconstruction and Development and the potentialities inherent in the International Monetary Fund, promised to be of great assistance in achieving world monetary reconstruction.

At the end of 1946, however, exchange restrictions still existed in most countries and, though they were mostly necessary, they were delaying a revival of world trade. Furthermore, an inflationary tension existed throughout the world as an aftermath of the war. The price indices spoke an eloquent language, as can be seen from Table VI.

Table VI.—World Price Indices

(From the 15th Annual Report of the Bank for International Settlements.)

It is appropriate to compare the development of the price indices with the movement of the exchange rates as quoted in New York for buying rates for cable transfer.

It must further be considered that the prices went up in most countries in the first postwar year and that they continued this rising tendency.

Canada appreciated the rate of Canadian dollars on July 6, 1946, to a buying rate of Can. \$1=U.S. \$1 and a selling rate of Can. \$1.001/2. Similarly, the buying rate for the pound sterling was fixed at Can. \$4.02 and the selling rate at Can. \$4.04. The price development in Canada on the one side and in the U.S. and Great Britain on the other side were the determining factors of this move. Swedish currency was revalued on July 13, 1946, from 23.852 to 26.195 cents in the New York market.

Under a system of severe price control and rigid exchange control, and after seven years of abnormal international trade relations, it was difficult to determine the initial rates with a hope of finding the precise point so that correct exchange cross relations and appropriate relations to the price level and further price development might be achieved. Nevertheless, great progress was represented by the existence of plans and machinery to work toward an international currency integration and stability, and toward the achievement of an international order which would be better than that existing in the interwar period. (See also Gold; International Bank for Recon-STRUCTION AND DEVELOPMENT: INTERNATIONAL MONETARY Fund; International Trade; Lend-Lease; for exchange rates of individual countries, see statistical tables in separate articles dealing with those countries.)

Exchange Stabilization Funds.—Exchange stabilization funds, set up after the collapse of the international gold standard in the 1930s, were established for the purpose of preventing undesirable fluctuations in exchange rates and promoting exchange stability in general. The funds had assets separated from the foreign holdings of the central banks and used them to intervene on the exchange markets. Even before 1914, the Austro-Hungarian bank had pursued the policy of preventing undesirable fluctuations of the Austrian currency by an intervention on the open market. After World War I such policy was carried out by a number of central banks which operated under the gold exchange system.

Not all exchange stabilization funds had the same objectives in their intervention on the foreign exchange markets. The British Equalization account was established in the spring of 1932; at that time it obtained £150,000,000 of treasury bills, which it could sell in the London money market to acquire sterling funds. In 1933 this amount was increased to £350,000,000. A complete balance sheet of the account was not published, but it was reported that the fund operated at one time amounted to substantially over £500,000,000.

An early formulation of the aims of the British Exchange Equalization account was that "the account was designed, without resisting general trends, to iron out undue fluctuations in the exchanges caused by sudden movement of capital and speculation." It was also designed to combat seasonal exchange fluctuations. Yet in practice the most important objective of the British account as well as of the other funds was to help establish and defend the chosen levels of the exchange rates, which of course implied sometimes resistance even to general trends in the exchanges.

Before May 1933 the British account could influence the

movement of the sterling rate in terms of dollar and the gold bloc currencies. A proposal made during the World Economic conference in London in 1933 for co-operation between the exchange funds or for the creation of a tripartite exchange fund, operated jointly by the U.S., Great Britain and France, was not accepted.

The U.S. Exchange Stabilization fund was set up as a treasury agency in Jan. 1934. It received \$2,000,000,000 of the government's profit from the devaluation of the dollar for exchange stabilization operations. Originally created for a period of two years, it was continued later by presidential proclamation. The chief aim of the fund was to promote greater exchange stability. At that time the defense of the dollar was directed against competitive exchange depreciation; the fund was supposed to prevent the dollar from rising in value in terms of other currencies. There was clearly a fight between the U.S. and British fund at several instances.

The French fund, established in 1936, was designed to promote exchange stability. At the beginning its task was to confine the fluctuations of the franc in terms of gold currencies within certain prescribed limits. It meant, however, to resist trends also.

The Belgian, Swiss and Dutch Stabilization funds were all created in 1935 and 1936 to defend their respective currencies at newly chosen levels in terms of major currencies. The functions of these funds could have easily been carried out by the respective central banks. In Belgium and Switzerland the funds were absorbed by the central banks after only a short existence.

When the Tripartite agreement between the U.S., Great Britain and France was concluded in Sept. 1936, it was intended that the three stabilization funds should co-operate closely to promote currency stability on a broad basis. The unsettled position of the French franc made this principal objective difficult, although both the British and the U.S. Stabilization funds intervened repeatedly to strengthen the French franc by purchases on open market. The British and U.S. Stabilization funds co-operated, often pursuing the main objective in mutual agreement.

The British fund, operating chiefly in dollars and francs, continued also in 1938 its policy of resisting exchange movements resulting from such forces as short term capital, and mitigating but not preventing movements caused by underlying cost-price disequilibria. Thus, for instance, the fund used its resources to support sterling against the flight of capital during the Czechoslovak crisis in Sept. 1938. However, it was not inclined to intervene against the decline of the pound caused by an unfavourable balance of trade. The fund was ready to assume the risk of holding dollar balances.

The fund devised a technique of insulating the domestic credit structure from the effects of international monetary disturbances. When, for example, the fund acquired sterling in Sept. 1938 by selling dollars and gold, it invested its new sterling resources in treasury bills thus replenishing the cash position of the bank. The cash ratio declined from 10.49 in August to 10.31 in September. During 1937, the U.S. treasury prevented gold imports from entering the currency and credit base by sterilizing them into an inactive fund. In Feb. 1938 the treasury announced that it would sterilize only gold imports exceeding \$100,000,000 each quarter. In April 1938 the policy of sterilizing gold was discontinued, and the \$1,250,000,000 in the inactive account was deposited with the federal reserve banks to stimulate credit expansion. The treasury carried out operations similar to those of the British Equalization account.

During 1938 the U.S. Stabilization fund supported weak

currencies, especially the pound and the French franc, by purchasing them either on its own account and converting them at once into gold, or by acting as agent for the foreign exchange funds. In this case a settlement in dollars each night was requested.

During most of 1938 the exchange stabilization activities of the U.S. consisted in support granted by the fund to weak currencies. These operations accounted for a great part of gold imports during the Sept. 1938 crisis, the imports being shipments between the exchange funds of Europe and the U.S.

The Bank of Netherland on Sept. 27, 1938, stopped buying sterling in the presence of heavy offerings. Until that time the Netherland fund continued to operate in sterling, and the balances were usually settled by gold transfers with the British fund. The French franc, after its further devaluation in May 1938, was practically pegged to the pound by the exchange fund. The fund was not very effective in protecting the money market from the effects of capital movements.

The stabilization funds were faced with a heavy task in March 1939 following the occupation of Prague by Germany because approximately \$700,000,000 in gold moved to the U.S. The determined intervention of the stabilization funds helped, however, in maintaining most exchange rates stable.

On Jan. 6, 1939, the British Exchange Equalization account purchased from the Bank of England gold then worth £350. The account, thus strengthened, held the sterling at about \$4.68 until the end of August.

Improvement in the domestic political and economic situation in the spring of 1939 aided the French fund, which was able to transfer gold to the Bank of France chiefly as a result of the repatriation of capital.

A new exchange fund was set up in China in 1939; a sterling credit was used to provide support for the Shanghai dollar.

The relatively calm period from May to Aug. 1939 was used by exchange funds to build up their dollar resources to meet future difficulties. By the end of August, foreign central banks deposits in New York totalled about \$400,000,000, while more than \$1,100,000,000 in gold was earmarked for foreign accounts by the federal reserve banks.

The growing war danger stimulated a new flight of capital to the U.S. The need to support the sterling was steadily increasing. By Aug. 25, the account stopped supplying dollars and allowed the sterling to decline. On Sept. 6, the remaining gold of the Bank of England was transferred to the Exchange Stabilization account.

World War II obviously changed the operations of the stabilization funds. The pound sterling was pegged to the dollar by means of a comprehensive exchange control introduced throughout the sterling area. In the now enlarged dollar area, exchange stabilization operations consisted mainly in pegging or supporting foreign currencies by using dollar resources. Although the U.S. Stabilization fund had not supported foreign currencies during the Polish crisis, the treasury announced in September that the Tripartite agreement was still in force and that its principle of co-operation was still being observed. However, after the defeat of France in June 1940 and Great Britain's firm exchange control, little was left to implement this declaration.

Canada's Exchange Equalization fund took over in May 1940 all the gold and foreign exchange of the Bank of Canada at current market prices and received in addition \$325,000,000 from the sale of treasury notes and bills for working capital. Under the exchange control system, oper-

ations of the fund were not very significant. The Swiss Exchange Equalization fund of Sw.fr. 535,000,000 was liquidated on April 30, 1940. Its assets were divided between the federal government, the cantons, and the National bank.

Thus the U.S. Stabilization fund was the only one of the major stabilization funds which continued to operate during World War II. It supported mainly the Latin-American currencies and the Chinese currency.

In April 1941 parallel agreements were signed between China and the U.S. and between China and Great Britain, by which the Chinese-U.S. and the Chinese-British stabilization funds were established, aiming at the stabilization of the relationship between the Chinese yuan and the U.S. dollar and British pound. A five-man board (three Chinese, one U.S. and one British national) was appointed by the Chinese government to manage the funds. Great Britain agreed to provide £5,000,000; the agreement with the U.S. called for the purchase by the U.S. Stabilization fund of Chinese yuan to the amount of U.S. \$50,000,000, and Chinese government banks had to contribute U.S. \$20,000,000.

The U.S. entered into stabilization agreements with Mexico, Brazil and Argentina. The agreement with Mexico, signed on Nov. 19, 1941, provided for the use of \$40.000,000 of the U.S. Stabilization fund to stabilize the U.S. dollar-Mexican peso exchange rate. The U.S.-Brazilian agreement was signed on July 15, 1937; under it the U.S. Stabilization fund undertook to purchase Brazilian cruzeiros to an amount of \$100,000,000. The undertaking with Argentina, signed on Jan. 1, 1941, was not ratified by the Argentine congress. Under this arrangement, \$50,000,000 of the U.S. Stabilization fund was set aside to promote stability between the currencies of the two countries.

On Aug. 15, 1941, the U.S.S.R. received \$10,000,000 from the U.S. Stabilization fund against gold to be delivered within 90 days and on Oct. 10 an additional \$30,000,000 against gold to be delivered within 180 days. These were the first two instances in which the U.S. treasury purchased gold for future delivery.

The largest operation of the U.S. Stabilization fund in 1942 was the extension of a \$500,000,000 credit early in the year to the Chungking government to strengthen the Chinese yuan. The treasury granted smaller credits to support Latin-American currencies throughout 1942, as for example the \$5,000,000 loan to Ecuador announced on Feb. 5 and the \$5,000,000 agreement with Cuba, effective July 6, 1942.

The role of the U.S. Stabilization fund in controlling foreign exchange values was further diminished in 1943. However, several agreements with small nations for the purpose of stabilizing exchange rates were renewed. The agreement in which the U.S. undertook to sell gold to Cuba in maximum installments of \$5,000,000 was extended to June 30, 1945. On June 30 stabilization agreements with Ecuador and Iceland were renewed for one year, and the Mexican accord was extended for two years. The maximum sums which the U.S. was obliged to purchase were: \$5,000,000 in Ecuadorian sucres; \$2,000,000 in Icelandic krónur; \$40,000,000 in Mexican pesos. The bill of April 1943, extending the life of the stabilization fund, specifically forbade the transfer of gold holdings to any international stabilization fund without the consent of congress.

Under the circumstances of war, the role of the U.S. Stabilization fund in controlling foreign exchange values

declined in importance. In most Latin-American countries, surplus exchange holdings continued to grow and limited the need for a direct intervention to support the stability of currencies. Through the renewal of expiring stabilization agreements and through operations conducted under the existing agreements, the policy of co-operating with friendly foreign governments in the stabilization of their currencies was continued.

On Nov. 24, 1943, the U.S.-Brazilian stabilization agreement was amended to increase the amount of gold made available for sale to Brazil to \$300,000,000. The agreement of Sept. 26, 1942, between the U.S. and Liberia was allowed to lapse by mutual consent on June 30, 1944, the purpose of the operations under this agreement (to facilitate the conversion of the Liberian currency system from a British coin basis to a U.S. dollar basis) having been achieved. The British coins acquired by the U.S. Stabilization fund in accordance with this agreement were in process of being sold for dollars to the British government. During the fiscal year 1943-44, the stabilization fund reduced its holdings of Swiss francs by more than Sooo,ooo, at the same time increasing the holdings of currencies other than the Swiss franc-French francs, belgas and sterling-by \$2,400,000.

On Feb. 15, 1945, identical bills were introduced in the senate and the house of representatives, respectively, to provide for the participation of the U.S. in the International Monetary fund and the International Bank for Reconstruction and Development. The bill called "Bretton Woods Agreement act" was passed by the senate and the house of representatives. By this bill the secretary of the treasury was directed to use \$1,800,000,000 of the Exchange Stabilization fund to pay part of the subscription of the U.S. to the International Monetary fund. Exploration, Polar

The ten years 1937–46 in polar exploration were characterized by a twofold advance: the contribution to geographical knowledge implicit in the discovery and mapping of unknown or little known areas was paralleled by tremendous forward strides in the accumulation of scientific data. And a concomitant of both phases was the development of new and improved techniques, especially in the way of transport and supply, clothing and diet.

The extent of the work being done immediately prior to the outbreak of World War II was evidenced by the fact that in 1937 and 1938 there were nearly 100 expeditions in the field in the Arctic and several in the Antarctic. After 1941, exploration in the Antarctic virtually ceased for the duration of the war, but in the Arctic the story was quite different. Although private expeditions were halted, the war provided a stimulus to government activity, and a great deal of scientific work, particularly in the fields of meteorology, hydrography and photogrammetry, was accomplished by the armed forces of the Allied nations. The results of this activity, heretofore restricted for reasons of military security, were just beginning to be released at the end of the decade. There were, however, important and interesting developments to be noted in connection with the expeditions at work in the first half of the decade.

Arctic.-One of the most dramatic events in polar exploration after the achievement of both poles was the establishment in 1937 of the soviet North Polar station and the subsequent voluntary drift of four men on an ice floe for nine months. The party, with all its equipment, was landed by air on a large ice field near the North Pole latitude 89° 26' N., longitude 78° W.) on May 21. About 274 days later, the men were removed by ice-breaker at a point off the east coast of Greenland (latitude 70° 48' N., londitude 19° 48' N.) to which they had drifted. During the period of the drift meteorological, magnetic, hydrological and other scientific observations were made regularly. The movement of the ice was studied, and it was found that the average drift of the floe at the northern end of the journey was 2.7 mi. per day. The rapidity of movement increased southward, however, until near the end of the drift the average speed reached 12.3 mi. per day. Hydrological investigations revealed that under a comparatively thin layer of cold Arctic water there exists a much warmer layer of Atlantic water which enters the Arctic sea in a strong current between Spitsbergen and Greenland and thereafter spreads out to cover a large part of the polar basin. The appearance of hare, polar bear and gulls in the region of 88° N. and the presence of plankton in the water disproved Fridtjof Nansen's theory, predicated on observations made in the drift of the "Fram" in 1893-96, that no life exists in the central part of the Arctic sea. Meteorological observations indicated clearly that much calmer weather is experienced in the region of the cold polar cap than in the areas bordering the Arctic sea.

A somewhat similar expedition, also productive of important scientific results, was the drift of the soviet ice-breaker "Sedov," which was trapped in the ice in the Laptev sea in Oct. 1937, and was finally freed by icebreakers

at the threshold of the Greenland sea in Ian. 1040. The contributions of the "Sedov" party to knowledge of conditions in the polar basin were numerous, and only the highlights can be touched upon here. For one thing, the legend of the existence of Sannikov Land, said to have been sighted by Jacob Sannikov off the coast of Kotelny Island in 1811, was finally exploded by twice crossing its supposed position. For another, the northeastern boundary of the Laptev sea was established at 78° 30' N. latitude, 139° E. longitude, where the continental shelf fell off to the great depths characteristic of the central Arctic sea. The existence of Nansen's surmised submarine ridge between Greenland and Spitsbergen was confirmed, the soundings in the middle portion of the ridge registering only a little more than 600 fathoms (3,600 ft.). Meteorological observations showed temperatures considerably higher than those recorded by the "Fram" 45 years before: the lowest air temperature registered by the "Sedov" was -44° F.; the lowest registered by the "Fram" -52° F. The indicated warmer conditions were further confirmed by the thickness of level ice-7 ft. 2 in.—as compared with Nansen's measurement of approximately 11 feet. Nansen's two "laws," namely (1) that the speed of the wind drift is approximately one-fiftieth of the velocity of the wind and (2) that the drift of the ice is deflected from 30° to 40° to the right by the rotation of the earth, were confirmed, and two new "laws" were formulated. These stated that (1) the drift of the ice follows the isobars, with the high-

The "Georgi Sedov" soviet icebreaker which set out in July 1937 to explore a possible 12-month Arctic sea lane, was finally contacted on Jan. 13, 1940, by the icebreaker "Joseph Stalin" (foreground) after 27 months in a drifting ice jam. In Feb. 1939 the "Sedov" had drifted closer to the north pole than any other ship to that time

pressure region to the right of the direction of the drift and the low-pressure region to the left, and (2) the drift of the ice takes place at a speed proportional to the gradient of atmospheric pressure. These new laws confirm the theory of the clockwise movement of the ice around Vilhjalmur Stefansson's so-called "pole of inaccessibility."

An event of considerable interest and colour in the annals of Arctic exploration was the first voyage from west to east through the northwest passage. This was accomplished by the R.C.M.P. vessel "St. Roch" and represented the second ship journey through the famous passage sought by mariners and explorers for centuriesthe first voyage having been made by Roald Amundsen in the "Gjoa," 1903-07, from east to west. The "St. Roch" left Vancouver on June 21, 1940, wintered at Victoria Island from Sept. 1940 to July 1941, and in the summer season of the latter year made her way to Pasley bay on the west side of Boothis peninsula, where the winter of 1941-42 was passed. After spending 11 months in Pasley bay, the vessel broke free early in Aug. 1942, and worked her way through Bellot strait to Pond inlet, finally arriving in Sydney, Cape Breton Island, on Oct. 8, 1942. In 1944, the "St. Roch" further distinguished herself by making the first one-season journey through the passage from east to west, leaving Newfoundland on July 28 and arriving in Vancouver on Oct. 16 after a perilous and eventful voyage of 7,295 mi. This second trip followed a new and more northerly route via Barrow strait and Melville sound. On the other side of the Arctic the northeast passage, perhaps better known as the northern sea route, under-

went considerable development during the decade 1937–46. By 1939, more than 150 meteorological and radio stations were established along its course and numerous expeditions were carrying out hydrographical and ice reconnaissance surveys. During the war, the route played an important part in the vital business of soviet supply, and undoubtedly there was a great increase in the investigation of weather and ice conditions.

Hydrographical observations made in the Greenland sea by the Louise A. Boyd expeditions of 1937 and 1938 revealed the existence of a submarine ridge in latitude 72° 41' N., longitude 2° 55' E. about midway between Bear Island and Jan Mayen. The bank, named for Miss Boyd, measures approximately 7 nautical mi. in length by 3 in width, and rises to within slightly more than 325 tathoms (1.950 ft.) at its highest point. The well-known Danish scientist Lauge Koch added materially to the knowledge of northern Greenland in the course of a flight over Peary Land in May 1938. Several of the important fjords were mapped from the air, and the mystery of Peary channel was solved at last by the rediscovery of the depression that had given rise to the channel legend 38 vears before. This depression was found to consist of a southeastward extension of the J. P. Koch fjord to a point only about 15 mi. from a low-lying lake, the pass between the two being comparatively low. A Norwegian-Swedish expedition to northeastern Greenland in 1939-40 had as its chief goal the investigation of the vitamin content of Arctic foodstuffs at different seasons of the year. Land and marine plants and the flesh and organs of various animals were systematically examined, and the results obtained promised to be of much practical value to Arctic travelers. In southern Greenland, a U.S. army detachment worked in the Angmagssalik area in 1942-43 with the dual purpose of establishing interior meteorological stations and investigating the possibility of emergency landing fields on the ice cap. From their studies, this group was able to draw new provisional contours of the ice cap which revealed the "southern dome" to be higher and more elongated than previously supposed. The Danish Geodaetisk Institut continued its program, based on field surveys, of the publication of sheets of the excellent topographical map of Greenland on the scale of 1:250,000. In Spitsbergen, considerable geological, hydrographical and survey work was done by Norwegian, British and German expeditions.

Several British parties were at work in the Canadian Arctic during the ten-year period. In 1937, valuable mapping and survey work was undertaken by J. M. Wordie on the northeast coast of Baffin Island. In 1937–38, an expedition to Ellesmere Island carried on general scientific studies and contributed a detailed map of a considerable section of the southeastern coast of the island.

In 1941, the five-year British-Canadian Arctic expedition was concluded; during its course maps and surveys were made in the Southampton Island-Foxe Basin-Baffin Island region. A considerable amount of photogrammetrical mapping was also done in Baffin Island and in other sections of Arctic North America by the air forces of the United States and Canada during the war. The published sheets were a distinct contribution to existing cartographic source materials of the region. One of the most important postwar explorations in northern Canada was "Operation Musk Ox," a Canadian government expedition whose primary purpose was the testing of motorized transport and other equipment under Arctic conditions. Twelve specially designed "snowmobiles," navigated by radar and

supplied by radio-directed planes, completed a 3,200-mi. tiek in the spring of 1946. The route described a huge arc from Churchill through Baker lake, Cambridge bay, Coppermine, Norman Wells and Dawson Creek to Edmonton.

Antarctic.—Exploration in the Antarctic area from 1937 to 1941 was productive of fruitful results. Half a dozen major expeditions were in the field during that period, and their reports revealed notable geographical discoveries and significant contributions to the store of scientific data

The British Graham Land expedition of 1934-37, led by John Rymill, returned to England with a fine record of achievement. The peninsularity of Palmer Land (also known as Graham Land) was finally established, as it was proved by ground travel that Stefansson strait and other channels seen from the air by Sir Hubert Wilkins in his flights of 1928 and 1929 were in reality broad, low glaciers Another discovery of importance was a deep channel averaging about 15 mi. in width, which separates Alexander I Land from Palmer Land. This same leature was observed by Lincoln Ellsworth in his trans-Antarctic flight of 1935 and was shown on the map compiled from his aerial photographs as a great faulted depression. The ritt, bordered on either side by mountainous coasts, was named King George VI sound by the Rymill group. The channel was followed for about 200 mi. southward by a sledge party to a point from which it was thought that the southern end of Alexander I Land could be seen. A sledge journey was also made across the southern end of the peninsula from Marguerite bay to the Weddell sea in latitude 69° 50' S. and the party then surveyed about 140 mi. of Palmer Land's east coast as far as 70° 40' S. The land was found to rise gradually from the west coast to an altitude of more than 7,000 feet, while east of the ice divide it became broken into mountain ranges with intermountain plateaus at various levels. A fourth major discovery was that the area of Alexander I Land was found to be nearly three times as great as previously supposed. Surveys and flights indicated the island's length to be about 300 mi.; its width was still unknown. Other achievements of the expedition included the compilation of a detailed map of the Marguerite bay area and some very interesting geological work leading to the discovery that the rocks of Graham Land and of many of the coastal islands are of igneous types closely allied to the Andes of southern South America.

Concurrently (1936–37), in another section of the continent, a Norwegian expedition under Lars Christensen was also making important discoveries. New land was found between 40° E. and 34° E. and was christened Prince Harald Land. This area was mapped from the air, as was the entire coast from West Barrier to Enderby Land. Altogether, the maps constructed from air photographs taken by the expedition covered an area of about 3,000 sq.mi., including nearly 1,250 mi. of coastline. In Princess Ragnhild Land a mountain range was discovered, extending for well more than 150 mi. in length and apparently about 10,000 to 13,000 ft. in height.

The year 1937 saw, too, the fifth commission of the Discovery committee's vessel, "Discovery II." The program of this voyage, which was concluded in 1939, contained two main items: a circumnavigation of the continent in the summer season to provide data for comparison with observations made during a similar voyage during the winter of 1932; and the recording of a long series of repeated observations on the Greenwich meridian and 20° E. Both projects were successfully completed, and a new chapter was added to the vessel's long history of accomplishment in the field of marine biology. As with

earlier cruises, emphasis was mainly on whales and their physical and biological environment, but various other aspects of the voyage are also of interest. During the circumnavigation of the continent the position of the pack ige was charted and a map giving mean positions for the months of September through March was constructed. The ice barrier between 0° and 5° E. was also charted, with a fairly reliable determination of the position of a part of the coast in that area. Virtually no indication of the continental shelf was found there, the land apparently dropping off steeply with a gradient as much as one in six. The barrier where first encountered was found to be floating in some 1,114 fathoms (6,684 ft.) of water.

Unusually heavy pack ice in the 1938-39 season delayed Lincoln Ellsworth's fourth Antarctic expedition and, together with a great deal of bad flying weather, prevented several long flights originally planned, but one major flight was accomplished. This was made on a direct course from latitude 68° 30' S. to about 72° S. on the longitude of 79° E.—a distance of more than 210 mi. Visibility was good, and at the turning point the country for some 100 mi. further south could be seen. In all, the flight provided a view of about 80,000 sq.mi. of the continent never before seen. The entire area seemed to present a gradual slope upward to a surface altitude of about 11,500 ft. No mountain ranges or patches of bare land were seen after leaving the coastal belt of hills. Previous to the flight, a visit had been made to a group of islands fringing the coast of Princess Elizabeth Land in latitude 69° 10' S., longitude 76° 30' E. A brief geological reconnaissance showed the structure of the islands to consist of granite and gneiss, with traces of iron, copper and nickel.

The German Antarctic expedition of 1938-39 on the catapult ship "Schwabenland" worked in the area between 12° W. and 20° E., and a map of this region was compiled on the scale 1:1,500,000. Nine exploratory and seven photographic flights resulted in the observation of approximately 231,000 sq.mi. of territory and the photogrammetrical mapping of an estimated 135,000 sq.mi. The "farthest south" reached in the flights was approximately 76° on the Greenwich meridian. The altitudes of a num-

ber of mountain peaks and various points in the ice field were determined, and meteorological, oceanographical, geophysical and other scientific observations were recorded.

One of the most extensive and ambitious of expeditions to work in the Antarctic was the U.S. Antarctic service expedition of 1939-41 under the command of Rear Adm. Richard E. Byrd. Two bases were established nearly 2,000 mi. apart-a west base in the Ross sea area (Little America III) and an east base in Palmer Land (Graham Land). Preliminary reports of the two parties indicated a number of important contributions. The main southern sledge journey from the east base discovered and surveyed about 460 mi. of new coastline and made astronomical determinations of the positions and elevations of 320 major mountain peaks. The real event of this journey, however, was the discovery of a southward and westward extension of the British Graham Land expedition's King George VI sound, terminating in the open sea. Alexander I Land was thus proved to be an island, as inferred by the British group. Exploration from the west base was projected by means of five reconnaissance field parties and two aeroplanes. The field parties were mainly concerned with scientific survey work in the coastal mountains to the east of Little America.

Aerial reconnaissance extended eastward from the base to approximately longitude 120° W. and during these flights survey photographs were taken for the later compilation of maps. Exploration to the west of the base resulted in a continuous aerial survey of approximately 400 mi. of the barrier face, and operations to the south were directed toward filling in the gap of mountains between Liv and Beardmore glaciers. In addition to the exploratory work undertaken by both bases, three cruises of the plane-equipped "Bear" led to the discovery of nearly 800 mi. of hitherto uncharted coastline and the exploration of more than 100,000 sq.mi. of unknown land to the east of Little America.

The scientific work of the expedition provided a rich

Antarctic explorers of the U.S. expedition under Rear Admiral Richard E. Byrd waving farewell to the flagship "North Star" as it left for exploration operations in 1940

harvest of interesting data. Observations were made in the fields of meteorology, geophysics, geology, biology and physiology (including studies of clothing, diet and the physiological effects of cold). Among the most interesting findings were those of the geologists to the effect that (1) King Edward VII Land and Marie Byrd Land together appear to be a separate petrographic and structural province and (2) the Antarctic Andes do extend south of latitude 72°, at least along the Weddell sea coast of the Palmer peninsula. One other phase of the scientific work also deserves to be noted, namely the detailed studies of the ice comprising the great Ross barrier.

Byrd Expedition of 1946-47.—The Byrd expedition, 1946-47, made under the auspices of the U.S. navy, was the fourth Antarctic mission led by Rear Adm. Richard E. Byrd. Specifically, the operation was designed to train personnel for combat conditions in polar regions and to enlarge geographical knowledge.

Byrd was in technical charge of the expedition, which consisted of more than 12 ships with a personnel of 4,000 officers and men. The mission sailed Dec. 2, 1946, with eight of the craft leaving from Norfolk, Va., and four others from San Diego and Port Hueneme in California. Adm. Byrd left Jan. 2, 1947, on board the U.S. aircraft carrier, "Philippine Sea." As the Antarctic summer drew to a close in March 1947, the expedition began its evacuation northward. Early reports said fliers found areas of ice-free lakes and evidence of coal and other important mineral wealth.

Export-Import Bank of Washington

The Export-Import Bank of Washington was established in 1934 to help stimulate the recovery of the foreign trade of the United States from the low level to which it had fallen during the depths of the depression. The bank was continued as an agency of the U.S. government by acts of congress in 1935, 1937, 1939 and 1940 and was made a permanent independent agency by the Export-Import Bank act of 1945, approved July 31, 1945. The purpose of the Export-Import bank, as laid down by the U.S. congress, was to aid in "the financing and facilitating of exports and imports and the exchange of commodities between the United States or any of its territories or its possessions and any foreign country or the agencies or nationals thereof." The bank was given broad powers to make practically any type of loan insofar as the exercise of these powers was necessary to carry out the fundamental purpose.

During the early years of the bank's operations from 1934-39, it operated on a relatively restricted scale. Thus, the amount of loans authorized by the bank during this period averaged less than \$50,000,000 a year, and disbursements were less than \$20,000,000 annually. Although the bank engaged in a variety of operations during these

early years in a manner typical of the flexibility of its operations throughout its existence, its principal activities consisted of credits extended to U.S. exporters, especially exporters of agricultural products and heavy equipment, to assist in financing transactions involving terms too long for financing by commercial banks. Precedents were set, however, for loans to foreign governments or their agencies to assist in financing development projects and programs in foreign countries, as well as in maintaining purchases from the U.S. of essential products.

Wartime Activities.-The events of 1940 brought the bank into a much enlarged sphere of operations. In the course of the year, congress twice increased the lending limit of the bank, in the first instance from \$100,000,000 to \$200,000,000 and in the second instance from \$200,000,-000 to \$700,000,000. The second increase was authorized in order to enable the bank to render financial assistance to the other American republics in maintaining their economies in the face of the disruption to trade resulting from World War II. There followed a series of authorizations for credits to Latin American governments to be used for carrying out public and other useful works projects, particularly railroads and highways, and credits to Latin American central banks to permit the purchase and importation from the U.S. of products essential to the economic life of the other American republics. New loan authorizations in 1940 were \$371,000,000; in 1941, \$180,-000,000 and in 1942, \$264,000,000.

Because of wartime shortages of goods and of shipping and the consequent difficulty of obtaining equipment and materials from the U.S. for new projects, loan authorizations by the bank fell to relatively small figures in 1943 and 1944, during which years they averaged about \$50,000,000 a year. The financing agreed to in the early war years nevertheless went forward and gave substantial support to the economies of the Latin American countries during a period of difficult adjustments to wartime circumstances. The bank also played a role, in co-operation with other agencies of the U.S. government, in stimulating the production of strategic materials in Latin America and elsewhere for shipment to the U.S.

Postwar Activities.—With the end of World War II in sight, preparations were made to make the Export-Import bank an effective instrument for financing the initial requirements of liberated and war-devastated countries for U.S. goods. The result was the Export-Import Bank act of 1945, which increased the limit on the loans and guaranties of the bank from \$700,000,000 to \$3,500,000,000 and removed the prohibition on loans by the bank to governments in default on their obligations to the U.S. government.

During the first year of peace, that is, from the middle of 1945 to the middle of 1946, the Export-Import bank authorized new credits amounting to approximately \$2,200,000,000. The loan commitments made by the bank during this period were mainly to liberated and wardevastated countries for reconstruction purposes. These reconstruction credits were used to meet the most urgent requirements of war-torn countries for U.S. products and services. They served the vital purpose of helping rebuild the economies of the countries concerned and thus hastening the restoration of normal trading relationships between these countries and the U.S. and the rest of the world.

Through its reconstruction credits extended during this period, the Export-Import bank was also filling a gap in the facilities for providing dollar credits to foreign countries pending the coming into operation of the International Bank for Reconstruction and Development (q.v.).

"As the Rest of the World Sees Us" by Coffman of the Ft. Worth Star-Telegram. Export-Import bank loans were the only means, other than cash payments, for foreign purchases of U.S. goods after the termination of lend-lease on Aug. 21, 1945

At the same time, the Export-Import bank maintained its traditional function of financing and facilitating the foreign trade of the U.S. by means of credits extended to U.S. exporters and importers, and credits extended to foreign governments in connection with development projects.

Types of Credit.—The detailed operations of the Export-Import bank resembled those of any lending institution, and its techniques were those commonly used in the field of international finance and investment. Any attempt to classify the credits of the bank into hard and fast categories is difficult because of their great diversity. However, the following types of operations undertaken during the ten-year period 1937–46 may be identified:

- 1. The bank extended relatively short-term credits to all exporters of a given commodity to assist in financing the sale and export of agricultural surpluses. For example, before World War II, the bank assisted in the sale of raw cotton to foreign spinners and dealers by establishing through U.S. commercial banks lines of credit available to U.S. cotton shippers and guaranteed by leading banks in the countries of purchase. Credits of this type were important before the war, and the bank arranged similar credits immediately following the end of the war.
- 2. The bank extended credits directly to U.S. firms exporting individual products, particularly heavy machinery and electrical and railway equipment. Such transactions were usually accomplished through the purchase by the bank without recourse of the obligations of the foreign purchaser endorsed or otherwise unconditionally guaranteed by a foreign bank or a foreign government.
- 3. The bank extended credit lines to individual firms which were experienced and of good repute but which

were hampered by lack of capital in obtaining adequate accommodations from private sources. Such credits were revolving and were available to the exporter for limited periods, generally from year to year, upon presentation for discount by the bank through an agent commercial bank of 90-day drafts on approved foreign purchasers. Comparable arrangements were made available to U.S. importers.

- 4. The bank extended credits to make possible the maintenance of essential purchases from the U.S. by certain countries during periods when they were temporarily short of dollar exchange. The loans to Finland and China before World War II were of this type, and there were a number of credits established for this purpose during the war in favour of banks in Latin American countries. The postwar reconstruction credits to liberated and wardevastated countries also fell in this general category.
- 5. Credits were extended to foreign governments and their agencies to assist in financing the cost of materials, equipment, and services required for the construction of productive public works and the development of natural resources, and thereby to increase the foreign trade potentials of the countries concerned. Prior to the large postwar reconstruction loans by the bank, credits of this type made up the major part of the bank's outstanding loans.
- 6. The bank established a number of credits during World War II to stimulate foreign production and expedite the transportation of strategic materials required for war production in the U.S.

Management.-The Export-Import Bank act of 1945 placed the management of the bank in a board of directors consisting of the secretary of state ex officio and four fulltime directors appointed by the president of the U.S. by and with the advice and consent of the senate, one of whom was designated by the president as chairman. Participation by other U.S. government agencies in shaping the policies of the bank was provided through the National Advisory council, consisting of the secretary of treasury, chairman, the secretaries of state and commerce, the chairman of the board of governors of the federal reserve system, and the chairman of the board of directors of the Export-Import bank. The council was responsible for coordinating the policies of the Export-Import bank with those of the U.S. representatives on the Monetary fund and International bank and with all other agencies of the government to the extent that they made foreign loans or engaged in foreign financial transactions. Eye, Diseases of

A common disorder of the eyes to which Sir Stewart

Duke-Elder gave the name of keratoconjunctivitis, was attributed to deficient lacrimation due to disease or atrophy of the lacrimal gland. It may be associated with xerophthalmia (laryngopharyngitis sicca) and enlargement of the parotid glands, which constitutes the Sjögren's syndrome. If keratoconjunctivitis sicca occurs alone without obvious systemic disorders, it may be difficult to determine the true nature of the condition. The patients complain of burning, pricking and smarting of the eyes, sometimes of photophobia. There is a characteristic stringy mucoid discharge which is difficult to remove. Sometimes a dryness of the eyes is noted, but in some cases deficiency of the lacrimal secretion is not evident on general inspection nor is the victim of the disease generally aware of a lack of tears. It is found commonly in young girls from 12 to 16 years of age after a mild bout of fever accompanying swelling of the lacrimal and salivary glands. In such cases there is a troublesome dryness of the mouth and throat requiring the taking of extra fluids with ordinary meals. The changes in the eye are most pronounced on the cornea, characterized by scuffing and roughing of the corneal epithelium and in severe cases the formation of epithelial threads, a condition known as filamentary keratitis. The amount of lacrimal secretion can be measured by a method devised by O. Schirmer, using strips of filter paper 5 mm. in width and 35 mm. in length. One end of a strip of filter paper is placed in the lower cul-de-sac of each eye at the inner angle near the punctum and the rest of the strip is allowed to protrude. With normal lacrimation the strip of filter paper rapidly becomes moist. The extent of the moisture is measured in millimetres from the eyelid margin in one to five minutes. Deficient lacrimation is not uncommon in women at about the menopause. With the involvement of the salivary glands the lacrimal gland may become markedly deficient in secretion, giving rise to annoying uncomfortable burning sensations of the eyes during prolonged periods of reading, viewing motion pictures, etc. The changes in the ocular tissues are due entirely to lack of wetting.

It was determined by careful anatomical studies that the normal cornea is covered by three protective layers of secretion. The first layer in contact with the cornea gives the epithelium a polished surface which aids in keeping it optically clear. The next is a layer of tears from the lacrimal gland and the third or outer layer is secreted by the marginal lid glands. In cases where lacrimal secretion is deficient the secretion from the Meibomian and marginal lid glands is excessive and yet does not wet the cornea. Various methods had been employed in treating a form of drying of the surface of the eye called keratoconjunctivitis sicca. These methods included the administration of drugs affecting the sympathetic nervous system so as to stimulate secretion from the glands, the application of substances to stimulate the flow of tears, and the application of artificial tears to relieve the irritation. Later, surgical blocking of the tear ducts was tried, using electric coagulation so as to hold some fluid on the surface of the eye.

Nicotine Amblyopia.—The ganglion cells of the retina and their fibres are extremely susceptible to the action of toxic substances. Some of these affect the peripheral cells, but most of them affect the central cells or fibres and thus interfere with central vision. Most of the toxins which cause central visual defects also cause peripheral neuritis, but tobacco is an exception. Only the visual elements distal to the chiasm are susceptible and it is probably the gang-

lion cells alone that are concerned in all types of toxic amblyopia. Tobacco belongs to the group of poisons which affect the central nerve elements of the retina. The poison may be absorbed by smoking, chewing, snuffing or eating tobacco so that the toxic substance is not necessarily a distillation product. In a series of reported cases the smallest quantity of cigarettes producing amblyopia was 70 a week. In all but the most advanced cases the prognosis is good if the use of tobacco is discontinued. Patients with tobacco amblyopia treated with intramuscular injection of acetylcholine responded with return of vision. The theory that damage to the optic nerve in tobacco amblyo pia is due to constriction of the arterioles is the basis for the use of vasodilator drugs in the therapy of nicotine intoxication. Good results from treatment were reported even though some of the patients continued to use some to bacco while under treatment. W. E. Herrell and P. L Cusick demonstrated the vasospastic effect of inhalation of tobacco smoke by photographing the retinal vessels of hyperactive individuals before and after inhalation of tobacco smoke to demonstrate arteriolar spasm. In cases of tobacco amblyopia without optic atrophy, visual improvement obtained with intramuscular injection of acetylcholine chloride roughly paralleled that obtained with intravenous injection of sodium nitrate. This lent additional support to the hypothesis that tobacco amblyopia is due primarily to vascular spasm in the visual pathway. Nourishing diet aids in recovery. Alcohol interferes with nutrition to the extent that it leads to inadequate diet and deficiency of the vitamin B complex.

Recurrence of nicotine amblyopia is uncommon but there are some cases on record. Cases of so-called tobacco-alcohol amblyopia were treated with vitamin B with satisfactory restoration of visual acuity and normal visual fields without decrease in the alcoholic intake or change in diet. When vitamin B was discontinued, the amblyopia recurred, and when it was again used, essentially normal vision was obtained. There was evidence to show that bet ter results were obtained by using the whole vitamin B complex rather than thiamin.

Trachoma.-A contagious disease of the conjunctiva prevalent throughout the world and responsible for innumerable cases of blindness was found to be due to an aetiologic agent which belongs to the group of filtrable virus. Trachoma is particularly prevalent in Egypt, India, the Mediterranean countries and among the North American Indians. The virus which proved to be the aetiologic factor in trachoma is identical with elementary and initial bodies found in the inclusion bodies of Prowazek-Halberstaedter. It was doubted in 1946 that trachoma was a specific infectious disease. No culturable bacterial disease was shown to produce trachoma when experimentally innoculated into man. The disease can be transmitted to healthy eyes of animals and man only by direct innoculation of cultivable material from a case of trachoma. Trachoma in American Indians was treated by Fred Loe of the U.S. public health service in the Rose Bud Indian reservation with sulfanilamide in 1938. Small doses of the drug (one-quarter to one-third of a grain per pound of body weight) with an equal amount of sodium bicarbonate were given once daily. The astonishing results were improvement of subjective symptoms in 72 hours, improvement of vision with disappearance of vessels and scars in the cornea in five days.

In countries other than the United States the effect of sulfanilamide was studied in a large group of cases of trachoma. With a few exceptions the cases were of the severe type with corneal complications. The conjunctivitis

and corneal complications responded especially well to sulfanilamide. The action of sulfanilamide is not specific for trachoma because other forms of conjunctivitis and corneal lesions have also reacted favourably to sulfanilamide. Gonorrhoeal ophthalmia responded on the usual basis of treatment (one grain to one pound of body weight) given orally. Patients with red, chemotic, bulbar conjunctivas, swollen retrotarsal folds and tumefied lids showed uniformly prompt subsidence. Since this type of patient is more likely to have involvement of the cornea if untreated, the rapid arrest noted with sulfanilamide is responsible for a much better prognosis. Sulfanilamide, when combined with some of its derivatives, seems to be more effective than when used alone. Intramuscular administration of sulfanilamide and sulfapyridine suspended in oil has the same therapeutic effect as oral administration but the advantage of prolonged action, smaller doses and less toxicity.

Blood estimation showed that sulfanilamide administered intramuscularly is present in the blood for approximately four days, while sulfapyridine remains in the blood for from 10 to 14 days whether suspended in physiologic solution of sodium chloride, olive oil, or 0.8% sodium hydroxide. The minimum therapeutic level appears to be between 2 and 2.5 mg. per 100 cc. In the intramuscular administration of the drug the dose is 2 to 5 grains per injection, depending on the weight of the patient, of sulfanilamide being given every 4 days and sulfapyridine every 7 to 10 days. Two to six injections are usually sufficient. For treatment of patients with trachoma who cannot tolerate sulfanilamide, neoprontosil (oral), because of its low toxicity, lends itself well to the treatment of trachoma when rather prolonged therapy is necessary. Although results of treatment with neoprontosil were not nearly so dramatic as those with sulfanilamide, on prolonged treatment the results in trachoma compared favourably with those of sulfanilamide, although the latter appeared to be the preferable drug.

Therapy.—After 1938 the sulfonamides revolutionized therapy of a number of ocular infections including trachoma, inclusion conjunctivitis, lymphogranuloma venerarum, gonorrhoeal ophthalmia, streptococcic pseudomembranous conjunctivitis, pneumococcic pyocyaneus, streptococcic ulcers, erysipelas, impetigo of the lids and staphylococcic blepharoconjunctivitis. The sodium salts of sulfathiazol and sulfadizine in powder form were used therapeutically in experimental and clinical wound infections with success. Despite alkalinity, these drugs could be used for corneal ulcers either in powder form or in ointment.

The favourable results of treatment of both local and general infections with penicillin gave rise to a new era in the therapeutic management of some ocular diseases. Penicillin and its derivatives were found to be particularly effective in retarding the growth of certain types of pathogenic bacteria when injected into the blood stream or when injected intramuscularly in sufficient amounts to maintain a stated blood level. For intraocular infections, penicillin was found to be effective when introduced into the blood stream. The good results with penicillin in some experimental intraocular infections of the interior segment of the eye and the anti-bacterial activity of penicillin in vitro against most organisms found in intraocular infections led to the use of penicillin introduced directly into the eye, either by direct injection into the anterior chamber or by ion transfer. The latter method was employed by Ludwig von Sallmann and Karl Meyer. The penicillin used was obtained from a strain of Penicillium notatum.

Introduction of 0.25% solution of sodium penicillin in the aqueous by ion transfer led in 45 minutes to a maximal concentration of 40 micrograms per cc. After a single application of solution of the sodium salt by ion transfer the aqueous exhibited antibacterial activity for almost four hours. Clinical studies of the effect of penicillin in external and internal diseases of the eye showed the drug to be more effective when used in combination with sulfadiazine.

Cataract.-Following the use of dinitrophenol, a drug recommended in the treatment of obesity, cataract developed in otherwise healthy and unaffected eyes. Many instances of rapidly developing cataract of a characteristic morphology occurred in relatively young persons in whom thorough study failed to reveal any aetiologic factor other than dinitrophenol. A total of 18 gm. of dinitrophenol was sufficient to cause cataract in one case. The average taken in all reported cases was 73 gm. and the amount ranged from a minimum of 9 gm. to a maximum of 126 gm. The onset of visual symptoms followed by a month to one year the discontinuance of the drug. Dinitrophenol intoxication, besides causing cataracts, increases the respiratory rate and causes loss of appetite, emaciation, disturbances of hearing, oedema, icterus, agranulocytosis, neuritis, kidney and liver disturbances, peripheral neuritis and abortion. Discontinuance of the drug and therapeutic treatment are of little or no avail after vision is disturbed beyond usefulness. Surgery is relatively easy, and surgical and optical results are uniformly good. The interesting observation was made that all cases occurred in the United States. This was probably due to use of an impure form of the drug.

Other toxic substances are known to produce cataract in dogs and albino rats by intravenous administration of a hypertonic solution; some of the most potent are sodium chloride, sodium sulphate, lythium chloride, galactose, arabinose, xylose, glycerine, ethyline glycol, amino acetic acid, sodium lactate and ethyl alcohol. The reaction on the lens appeared to be due to the hypertoxicity rather than to the chemical nature of the solution.

In 1942 N. M. Gregg reported the occurrence of congenital cataract and other congenital abnormalities in the infants of mothers who had German measles (rubella) early in pregnancy during a severe epidemic of the disease in Austria. Toxic or infective process in the mother may cause a derangement in the lens of the foetus. Gregg suggested that as an alternative to German measles the rash might have been a toxic exanthema caused by streptococcus. During the following years the occurrence of congenital cataracts in infants born of mothers who had rubella during the early months of pregnancy began to multiply as the knowledge of the association of the conditions became generally distributed. In most reported instances rubella occurred in pregnant women during the first two to six weeks of pregnancy. Some did not even realize that they were pregnant at the time the disease occurred. The disease is of a mild type, but in all there was a rash and a history of contact with some person suffering with rubella.

As to the prevention of rubella cataract, it was suggested that all young girls be exposed to rubella to avoid contracting the disease during pregnancy. Also the question arose as to whether or not therapeutic abortion is indicated if the disease is contracted in the first three months of pregnancy.

In addition to cataracts present at birth other congenital defects were noted in infants and attributed to

the fact that the pregnant woman had suffered from German measles (rubella). Among the eye defects observed were failure of the eye to develop fully so that the eveball was too small and also blocking of the tubes passing from the eye to the nose. These changes were believed to be due to inflammation of the tissues of the child while it was still in the mother's uterus. Other congenital defects included disturbances of the heart, clubfoot, failure of the testes to develop and to pass into the scrotum, and failure of development of the urethra which carries the urine from the bladder to the point of exit.

The therapy of congenital cataract is surgery.

Surgery.—Enucleation of the eye calls for a substitute for the eyeball for cosmetic effect. Several procedures were adopted, the most common being the insertion of a blownglass artificial eye. This substitute for the eyeball was not satisfactory because a lack of movement of the artificial eye was apparent in most persons who wore one, and the eye usually gave a sunken appearance caused by atrophy of the orbital tissues.

There are three major reasons for removal of an eye, and the type of operation to be performed and the type of substitute worn depends upon the reason for the removal. In cases of tumour of the eye and of serious damage from blows the danger of involvement of the second eye with severe inflammation and loss of sight had been prevented by removal of the damaged eye. By 1946, the presence of glaucoma with increased intraocular tension or of tuberculosis of the eyes with great pain was an indication for removal of the eye. Other surgical procedures, however, were sometimes considered successful in controlling the conditions as well as complete removal of the entire eyeball. In cases of blind unsightly eyes that offend the æsthetic sense evisceration is the operation of choice. The best cosmetic result in removal of the eye follows the operation of evisceration with implantation into the scleral cavity of some substance over which or to which a prosthesis may be fitted. If that operation is contraindicated by an acute infection, simple evisceration may be performed with subsequent implant in the scleral capsule when the infection has subsided. If the condition indicating removal is one of tumour or possible sympathetic ophthalmia, the cosmetic results must be sacrificed in favour of enucleation with implantation.

A great stimulus to the perfection of substitutes for enucleation arose in the military services during World War II in an effort to supply suitable artificial eyes for wounded men. A satisfactory prosthesis developed by Dr. A. D. Ruedemann won the Gold Medal award at the scientific exhibition of the American Medical association in 1946. It consists of a tantalum mesh to which is attached an acrylic prosthesis on which is painted a replica of the color segment of the fellow eye. Deficiencies in the orbit may be met by implanting rolled tantalum mesh and sewing it in position to prevent sagging of the prosthesis or the eyelids. The tantalum does not set up tissue reaction. It is not acted upon by body fluids and lies indefinitely without absorption or corrosion. When the eye is enucleated, the ocular muscles are identified, brought back to normal position on the tantalum mesh substitute, and firmly anchored by means of cat gut sutures. In this way the normal position of the eye is maintained, and move ment of the artificial eye is facilitated. The use of tantalum mesh and acrylic gives most satisfactory results.

Contact Lenses.—It appeared during the decade 1937-46 that contact lenses would never be a substitute for spectacles for most people, but they would be an important visual adjunct to many patients who must have correction of their refractive errors but do not wish to use spectacles for public appearance and social engagements. Many patients need contact lenses for sports or occupational uses where regular glasses cannot be used. There are some patients who cannot obtain good vision with any other ophthalmic device. Patients with keratoconus, high astigmatism, asymmetric astigmatism, irregular astigmatism and some types of scarred cornea compose this group. The contact lens offers the only practical method of obtaining binocular vision in monocular aphacia. Often high myopes obtain better vision with contact lenses than with spectacle lenses. Therapeutic contact lenses provide the only perfect means of correction of refractive errors. Since the lens rotates with the eye the optical centre of the lens and the immediately adjacent area alone is used. Regular spectacle lenses limit the field of corrected vision obtained by rotation of the eye. Aberrations become effective in the peripheral area of the spectacle lenses and distort the

During the decade many methods of fitting contact lenses were used, including a number of moulding techniques. The five necessary steps in fitting contact lenses were: (1) refraction with trial contact lenses to determine the radius of curvature of the posterior surface and power of the contact lens needed to correct ametropia; (2) making the impression of the eye to obtain scleral shape and corneal diameter; (3) fitting the semifinished lenses; (4) refraction of the patient's eyes while wearing the semifitted lenses; and (5) selection of tolerable solution.

Fadden, Arthur William

Fadden (1895-), Australian politician, was born April 13, 1895, in Ingham, Queensland, Australia. He won a seat in the Australian house of representatives in 1936 and became acting prime minister while Robert Gordon Menzies represented Australia at London conferences in 1941. Growing Australian dissatisfaction with Britain's conduct of World War II led to the downfall of the Menzies government, and Fadden became prime minister on Aug. 28, 1941. At the same time he was unanimously elected leader of both the Country party (his own party) and the United Australian party. But foes of the Menzies regime contended that the new Fadden government was merely a continuation of the Menzies government, and on Oct. 3, 1941, Fadden's cabinet fell after a tenure of only

37 days. As a courtesy to Australia and to its former prime minister, Fadden was appointed to the British privy council on April 4, 1942.

Fair Employment Practice Committee

The Fair Employment Practice committee was established June 25, 1941, by President Franklin D. Roosevelt for the purpose of assuring all workers equal opportunity in war production and government service regardless of their race, colour, creed or national origin.

Discriminatory barriers against minority group members were currently revealed in the fact that Negro and Mexican-U.S. workers were being turned away from defense plants which welcomed white applicants. The executive order which established FEPC forecast the subsequent war need for the fullest use of the entire U.S. work force, and at the individual worker's highest attainable skill. A corollary aim was to bolster the morale of minority groups, on the premise that the defense of democracy demanded the full participation in the war effort of all groups within the nation.

The first committee appointed by the president had only limited means to handle the many cases of discrimination filed with it. Reliance was placed mainly on public hearings which demonstrated the widespread existence of discrimination.

On May 27, 1943, President Roosevelt issued the executive order which set up a new FEPC and made mandatory that all war contracts and subcontracts include a non-discrimination clause. Increased funds permitted extension of the committee's services to 15 field offices in major industrial cities. The War Manpower commission, war and navy departments and other contracting agencies were originally responsible for ending discrimination within their jurisdictions. FEPC made agreements with them to process the cases which they could not settle.

The committee received during the last two years of World War II an average of more than 300 complaints of discrimination a month. About two-thirds of these were dismissed for lack of jurisdiction or merit. One hundred satisfactory settlements of valid complaints were made each

Views of three major fairs, left to right: the Tower of the Sun, looming above one of the Elephant Towers at the 1939 Golden Gate International exposition, San Francisco; Japan's exhibit at the 1937 Exposition Internationale, Paris; and Constitution mall at the New York World's fair, 1939—40

month, mostly by informal meetings of the field staff with management and workers. Some 40 racial strikes were ended through committee staff aid.

The war need for workers, and the removal of discriminatory barriers by FEPC and other agencies, placed 1,500,000 Negroes and Mexican-Americans in the prime war industries at peak employment in Nov. 1944. Nearly 300,000 Negroes were then in government service, including army and navy civilian establishments.

Congress voted FEPC a \$500,000 appropriation for the fiscal year 1945. Next year this was cut to \$250,000. The agency halved its staff in July 1945. The end of the war that summer diminished its influence. A bill to establish a permanent peacetime FEPC was tabled by Congress after a three week's filibuster in the senate in Jan. 1946.

The wartime FEPC was suspended for lack of funds May 3, 1946. In a final report to President Harry S. Truman, the agency noted a postwar rise in discrimination against Negroes and Jews. It recommended that the president urge upon congress the passage of a law against racial and religious discrimination in industry, and that the government itself take steps to enforce the national policy against discrimination within its own services.

Fairs, Exhibitions, Expositions

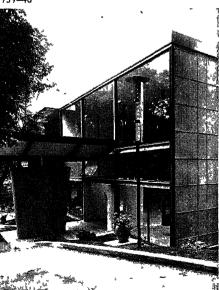

The period of 1937-46 saw three expositions of truly international significance: the Exposition Internationale des Arts et des Techniques in Paris, 1937; the Golden Gate International exposition, San Francisco, Calif., 1939-40; and the New York World's fair, 1939-40—the last two being the first competitive international expositions in the same country at the same time.

The Empire exposition in Glasgow, Scotland, in 1938 was of somewhat limited scope and was a lineal descendant of previous expositions of the empire initiated at London in 1851.

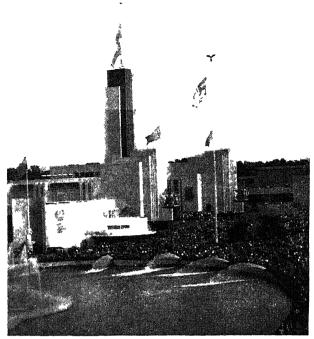

World War II brought the demolition of the properties in Germany which had housed the later Leipzig fairs, outgrowth of an annual event of almost goo years' uninterrupted repetition.

The Paris exposition was essentially European, although Japan and the United States provided their own pavilions

The soviet pavilion, one of the more frequently visited exhibits at the New York World's fair (1939–40)

in company with 15 principal European nations. Like all previous Paris expositions, the 1937 exposition stretched along the Seine. However, it was distinguished from its predecessors in that, with few exceptions, the pavilions represented departures in exposition architecture in both materials and design. The exposition was also marked by more profuse use of colour, especially in floodlighting at night.

Both the Golden Gate International exposition and the New York World's fair were located on sites especially prepared for their use and later adapted for public purposes—in the first instance an airport and in the latter a public park.

The San Francisco exposition was built on Treasure Island, a 400-ac. site created in San Francisco bay with 25,000,000 yd. of sand plus top soil taken from another Island. Landscaping was lavish, and floodlighting was extensively used to accent the blend of oriental and western architecture which characterized the exposition. The purpose of the exposition was to commemorate the completion of the Golden Gate and San Francisco bay bridges and to strengthen the friendship between the U.S. and the nations of the Pacific. Twenty-six nations of the Pacific, the Americas and Europe participated, as did 15 states and territories of the U.S.

The Golden Gate exposition, like the New York World's fair, followed the precedent of the successful Chicago Century of Progress (1933–34) by staying open a second year in an effort to recoup the investment. Like the New York fair, it was not successful financially in spite of the second year of operation. After 1926 the U.S. government had not made significant financial grants to expositions, and private investors had not found it possible to recover their capital in one year of operation. The two-year international exposition was peculiar to the U.S.

The paid attendance of almost 45,000,000 admissions to the New York World's fair established it as the most heavily attended international exposition in history. Spread over a 1,200-ac. area of Flushing Meadows, it represented expenditures by the management, exhibitors and others of an estimated \$200,000,000 for construction and operation.

With minor exceptions, no replicas of historical buildings or types of architecture were permitted. The Board of Design required that all construction emphasize the advantages of temporary construction and new materials. While the pressure of time during the construction period did not allow the exposition designers to enforce complete harmony with their plans, the New York World's fair was unique in its display of new types of architecture on a gigantic scale. The fair was also unique in its control of colour effects in both materials and lighting in order to establish predetermined colour patterns over the entire area of the exposition. There was extreme competition between private corporations in the construction of industrial exhibits; this had started at the Century of Progress in 1933 and 1934.

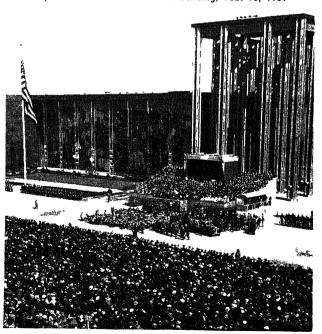

Though the New York fair officially commemorated the 150th anniversary of the inauguration of George Washington as president of the U.S., its primary motif was the world of the future. This theme was expressed in the imaginative "democracity"—the city of the future—constructed in miniature in the perisphere, which with its adjoining trylon was the theme centre of the exposition.

The perisphere was 180 ft. in diameter and the trylon more than 700 ft. in height. This theme centre, with the exception of the Eiffel tower, was unprecedented in management-built exposition structures.

In all, 63 foreign nations participated in the first year of the New York fair and established it as the most international of all such expositions. In addition, 25 states and territories of the U.S. furnished exhibits, many in their own buildings.

The Golden Gate exposition and the New York World's fair detracted from each other's attendance and both suffered from the diversion of public interest and the uncertainty occasioned by the opening of World War II. The New York fair was handicapped particularly by the withdrawal of many foreign exhibitors during its second year—because of their participation in hostilities. (See also Architecture.)

Faisal II

King Faisal of Iraq (1935—) was born May 2, 1935. After his father, Ibn Faisal Ghazi, died April 4, 1939, following a motorcar accident near the royal palace in Baghdad, young Faisal was enthroned as Faisal II. His uncle, Abdul Ilah, was appointed regent to rule the kingdom until Faisal reached his majority at 18. The youthful king was being schooled for his future role by Abdul Ilah and an English governess. Besides Arabic, his native tongue, he learned to speak English and Turkish.

During the pro-axis revolt staged by Rashid Ali in April 1941 Abdul Ilah fled from Baghdad and as-Sharif Sharaf replaced him as regent while the boy king was retained on the throne. After the Rashid Ali rebellion was put down by British arms, Abdul Ilah returned to Baghdad June 1, 1941, and resumed his post as regent.

Famines

The world's constant food shortage in the countries of greatest population, India and China, was brought into sharp relief during the latter part of the decade 1937–46 as a result of the organization by the United Nations of two new agencies, the United Nations Relief and Rehabilitation administration (q.v.) and the Food and Agriculture organization (see Agriculture; United Nations). The first of these spread its activities over the world in a manner never before attempted, while the latter began to survey the world's food needs and make plans for better nutrition. Before these organizations began active work, however, the war in China had become a factor in increasing the suffering resulting from food shortages in that part of the world.

From 1937 to the outbreak of World War II in Europe, the principal famines were in China and India. Certain areas had crop failures and were unable to get supplies from other areas of surplus production because of the constantly growing population which consumed these supplies. Poor transportation facilities and ineffective government aid were the principal handicaps. The Chinese provinces of Kwangtung and Honan were so short of food that many deaths from hunger were reported. The rice usually available in Siam and Burma could not be brought in because of the Japanese invasion. Surpluses could not be found in nearby areas in China. Estimates of deaths ranged from 500,000 to 2,000,000 but these were not reliable, as deaths from disease were not distinguished from those resulting from hunger. In Bengal, India, the food shortage grew acute from 1933 to 1943 as the population in-

A hungry European, one of millions who looked to the United Nations for relief from famine after World War II, pending the reconstruction of war-torn economies

creased by many millions. The loss of the 1942 rice crop and the threat of Japanese invasion disturbed the markets, promoted hoarding by those who had the food and left the poorer classes without supplies. Many already on the margin of starvation were reduced to rations below subsistence level. Estimates of deaths from hunger ranged from 250,000 to 1,000,000 persons in Bengal alone. The central government of India shipped large supplies to the stricken regions and held an All-India Food conference to plan for food distribution.

Such facilities were very limited in China due to the Japanese occupation. The use of cargo aeroplanes to transport food to areas in critical need was a chief factor in averting starvation in many areas. Total crop failures were few during the decade, but the drought in 1944 throughout the southern hemisphere severely damaged the cereals. Another drought in India early in 1946 was reported to have reduced wheat output 25%. Scourges of locusts in Sardinia and in Albania were attacked with poisons provided by U.N.R.R.A. The Yellow river project in China to divert the river to an old channel and save thousands of acres from flooding was pushed to completion. Faminelike conditions existed in many areas in Europe during World War II when there was no food for public relief available. Poverty-stricken people suffered, particularly in the cities where bombing had destroyed storehouses and transportation facilities.

Early in 1946 a widespread campaign to save food was begun in the United States after shipments for relief purposes had fallen below the quota expected of the nation. Prices were raised to secure larger shipments of relief wheat and resulted in delivery of the U.S. quota by the middle of the year. Mass starvation was widely publicized

as an imminent possibility, and a special mission, led by former President Herbert Hoover, was sent to several needy countries to appraise the situation. Upon his return, Hoover reported that there would be no mass starvation anywhere with the possible exception of some inaccessible parts of China. It was explained, however, that he did not refer to the deaths that might result from under-nutrition among impoverished people in devastated countries.

The F.A.O. at its second assembly at Copenhagen, Denmark, considered a proposal for a World Food board, supported by the United Nations, to supervise the distribution of food surpluses in a manner to avoid famine conditions and to increase the diets of these countries remaining on a low level of nutrition. The plan was referred to a commission for further study. A survey of prewar conditions showed that the poorest diets in terms of calories were in Korea, Iran, Iraq, Trans-Jordan, Mexico, Colombia and El Salvador. The best were found in New Zealand, Argentina, Denmark, the U.S., Great Britain and Canada. Countries which had experienced famine conditions most frequently were getting about 2,000 calories per day while those in the best-fed group consumed an average of more than 3,000 calories per day. It was estimated that over half of the world's population had available less than 2,250 calories per day. While it was not regarded as possible immediately to increase the food supply of the world sufficiently to lift the diet of the deficient countries to the level of the average, it was thought possible to adjust the distribution of foodstuffs so as to put an end to famines of the extent of the preceding decade. The problem was one of international finance even more than one of production. (See also Agriculture; Food Sur-PLY AND WORLD WAR II.) (J. C. Ms.)

Farm Co-operatives

See AGRICULTURE; FARM CREDIT ADMINISTRATION.

Farm Credit Administration

The Farm Credit administration, operating through 12 district offices and numerous local associations in the continental United States and Puerto Rico, in the years from Jan. 1, 1937, through June 30, 1946, extended credit totalling \$8,000,000,000 to individual farmers and their business co-operatives for financing farms, for farm production and for marketing farm products and purchasing farm supplies.

The value to agriculture of the Farm Credit administration, however, was not measured solely in number of dollars loaned to farmers and their organizations. Quite as important were the services rendered by this co-operative system. The biggest contribution of the federal land banks in making long-term farm mortgage (land bank and commissioner) loans had come in the years just prior to the decade 1937-46.

During the decade the FCA made rapid strides in developing the co-operative principles of farmer ownership and control. Farmer borrowers and their business co-operatives increased the proportion of their investment in the

system to total capital stock, as shown by the fact that on July 1, 1946, the institutions supervised had the smallest amount of government capital since the FCA's establishment in 1933. Borrowers—farmers and farmers' co-operatives—had a net investment of \$107,778,700 in capital stock of production credit associations, national farm loan associations, federal land banks, and banks for co-operatives.

Farm Mortgage Credit.—The 12 federal land banks, which had been operating since 1917, were authorized to make amortized farm mortgage loans through local national farm loan associations. Upon obtaining a loan the borrower purchased stock in the association to the extent of 5% of the amount of the loan, and the association in turn subscribed to a like amount of federal land bank stock. The association endorsed and thereby became liable for the repayment of the loan. The banks obtained funds for making loans through the sale of bonds, and the difference between the bond interest rate and the interest rate on the loans gave sufficient operating spread, under normal conditions, to permit the banks to pay all costs of operations, build up reserves and absorb losses which might occur on defaulted loans.

During the period from Jan. 1, 1937, through July 1, 1946, the federal land banks made 165,921 loans for \$649,490,395 and strengthened their own financial position and that of the national farm loan associations.

Beginning in 1933, the federal land banks also acted as agents for the land bank commissioner and the Federal Farm Mortgage corporation in making and servicing commissioner loans and, like land bank loans, this source of credit was made available through and serviced locally by the national farm loan associations. During the period from Jan. 1, 1937, to July 1, 1946, 181,035 commissioner loans aggregating \$303,553,721 were made.

On July 1, 1946, the capital stock of 11 of the 12 federal land banks was owned by the local national farm loan associations and those borrowers who had obtained direct loans in localities where the services of national farm loan associations were not available. Stock in the federal land banks owned by national farm loan associations and direct borrowers totalled \$65,790,086 on July 1, 1946. In addition, the banks had accumulated reserves and earned surplus of \$167,705,709, or a total of \$233,495,795 on July 1, 1946, compared with \$163,764,591 on Jan. 1, 1937. During the fiscal year 1945-46, eight of the federal land banks paid dividends on their capital stock, and in many cases these dividends were passed on to borrowers themselves by the associations after setting aside legal reserves required by law and such other reserves as might be justified by sound business practices.

As a result of high commodity prices, wartime income and other favourable economic factors, the farm mortgage debt of the country dropped from more than \$7,000,000,000 to about \$5,000,000,000. This decline was reflected in both land bank and land bank commissioner loans, which dropped from \$2,900.000,000 on Jan. 1, 1937, to \$1,200,000,000 on July 1, 1946. During the year ending June 30, 1946, 29,700 farmers obtained land bank and commissioner loans for approximately \$135,000,000, the highest in number and amount after 1936. However, borrowers repaid \$297,839,349 during the same period; that is, about \$2.21 was repaid for each dollar of new credit extended.

As a further result of these favourable factors, the number of farms owned by the federal land banks and the Federal Farm Mortgage corporation declined from 31,454 on Jan. 1, 1937, to 431 on July 1, 1946. Foreclosures in the U.S. by all lenders dropped from 20.5 per 1,000 farms mortgaged to 0.8 per 1,000 farms mortgaged in 1946.

The federal land banks based their loans on normal agricultural values. An amendment to the Federal Farm Loan act in 1945 permitted the federal land banks to loan up to 65% of the appraised normal value of the farm offered as security. Previously, land bank loans could not exceed 50% of the value of the land and 20% of the value of the permanent insured improvements. Land bank loans were limited to \$50,000 to any one borrower. Commissioner loans could be made up to 75% of the normal agricultural value of the property but might not exceed \$7,500 to any one borrower.

The years from 1937-46 witnessed a marked contrast in the purposes for which loans were made. Prior to and early in the period the great majority of loans were made to refinance indebtedness, while in the latter years credit was used to a much greater extent to buy land and equipment, to improve land and buildings and to meet other current

By an amendment to the act in 1937, farmers were given greater assistance in stabilizing their payments on land bank and land bank commissioner loans by means of conditional or future payments. A farmer could make a future payment on his loan, and these funds were held by the federal land bank and applied to future maturing loan instalments as directed by the borrower. Interest was paid by the bank on future payments at the same rate as that borne by the loan. On July 1, 1946, future payments totalling \$21,523,526 were held by the federal land banks and the Federal Farm Mortgage corporation.

In Feb. 1945, the federal land banks made the first public offering of consolidated bonds since 1936, and this and three subsequent offerings made prior to July 1, 1946, were heavily oversubscribed. Consolidated bonds outstanding on July 1, 1946, amounted to \$779,835,000 for which the federal land banks were jointly and severally liable. These bonds were not obligations of the government of the U.S.

Production Credit.-During the ten-year period, the 500odd production credit associations, operating since 1933, showed a continuous growth in membership, in reserves and in percentage of capital owned by farmer members. These associations were established to provide credit for farm production of crops and livestock.

During World War II, the associations geared their activities to finance increased demands for food. Loan volume went from \$286,577,842 in 1937, to \$500,000,000 or more for each of the four years prior to July 1, 1946. More than 390,000 farmers and ranchers were members of production credit associations on July 1, 1946. This compared with 242,616 on Jan. 1, 1937.

The goal of complete farmer ownership of the production credit system in the ten years came more clearly into sight. The capital of the associations when first organized in 1933 and 1934 was almost entirely supplied by the government through the 12 production credit corporations. However, each member was required to own stock equal to 5% of the amount of his loan. On Jan. 1, 1937, capital of the associations owned by farmer members amounted to \$10,778,693, or 11.9% of net worth, and that owned by production credit corporations amounted to \$74,824,150, or 82.3% of net worth. On July 1, 1946, the 390,000 members owned stock in the par amount of \$35,506,615. This investment, added to earnings of \$37,058,568 accumulated to July 1, 1946, represented 60.2% of the association's net worth as compared with 17.7% on Jan. 1, 1937.

As in all co-operatives, savings in production credit association operations after building up adequate reserves were returned to the members. The first production credit association dividends, however, were distributed in 1940, associations, while in a position to pay dividends, preferred to accumulate still larger reserves as a safeguard for less favourable times. During their early years most of the associations used part of the income from the investment of government capital supplied by the production credit corporations to pay operating expenses. As the system grew, other income

when eight associations made their initial distribution to

stockholders. This number increased to 34 in 1945. Many

or member income increased. In 1937, the aggregate member income exceeded combined expenses by \$685,862, but this compared with \$2,126,993 in 1945. Some associations unable to operate on member income were located in areas where the type of farming followed and other conditions were not conducive to profitable operation.

The production credit system in the ten years gave serious attention to its program of improving the quality of credit services provided by the associations and to adapting its facilities carefully to meet the sound credit requirements of individual farmers.

The budget loan, popularized by the production credit association, proved highly acceptable to farmers. Through its use farmers saved money and time. In the spring, a farmer would arrange for his credit for the coming season for both crop and livestock production and it would be advanced as he needed it, some when he bought feed and seed, and some later at harvest time. He would repay the loan when he sold the crops and livestock financed.

Losses on loans amounted to approximately one-eighth of 1% of the total amount of cash advanced.

Credit for Co-operatives.—The 13 banks for co-operatives, including the Central Bank for Co-operatives, extended credit to farmers' co-operative associations totalling more than a third of a billion dollars in each of the years 1943, 1944, 1945 and 1946, including the financing of Commodity Credit corporation loan documents. This compared with \$97,584,000 in 1937. This greater loan volume was largely the result of increased demands from co-operatives which were processing and marketing foodstuff and fibres needed during the war years.

From Jan. 1, 1937, to July 1, 1946, the 13 banks advanced \$2,337,503,434 in credit to co-operatives. These funds were used, among other purposes, for erecting and equipping buildings, for operating purposes and for effective merchandising.

During the period of high wartime income for farmers, farmers' co-operatives also were able to acquire a favourable financial position. Many co-operatives increased their capital and became debt free, occasioning a smaller need for credit.

In addition to extending credit to co-operatives, the banks for co-operatives also helped by counselling with and advising co-operatives to build strong capital structures, to retire indebtedness as rapidly as possible during favourable times, to be alert in effecting economies in their operations, to perfect their corporate structures in order to insure that farmer members would retain an active interest in and control of their associations and to seek every means whereby the business of farming might be made more profitable and secure.

The 13 banks for co-operatives also improved their financial position. Surplus earned and reserve for contingencies totalled \$36,085,836 on July 1, 1946, which compared with \$7,719,860 on Jan. 1, 1937. Capital stock owned by borrowing co-operatives increased from \$2,809,300 on Jan. 1, 1937, to \$6,482,000 on July 1, 1946. U.S. govern-

ment paid-in capital totalled \$178,500,000 on July 1, 1946. Federal Intermediate Credit Banks.—The 12 federal intermediate credit banks were the main source of loan funds for the production credit associations. More than 75% of the banks' loan volume comprised loans and discounts for the associations. The banks, however, dealt with approximately 600 financial and banking institutions and associations, including the production credit associations and banks for co-operatives, engaged in making short- and intermediate-term loans to farmers and stockmen and their co-operative associations. They also made some loans direct to farmers' co-operatives.

The 12 banks reached an all-time peak volume in loans and discounts of 5948,333,052 in 1944. This compared with \$405,870,342 in 1937. Funds to make these loans and discounts came largely from the sales of debentures in the investment market. Debentures of the credit banks continued to be regarded as prime securities by the investing public, and issues offered during the ten years were heavily oversubscribed. These debentures were not guaranteed, either as to principal or interest, by the federal government.

The banks in 1945–46 operated with paid-in capital of \$60,000,000 subscribed by the U.S. government. This compared with \$100,000,000 of government capital in the banks in 1937. Less capital was needed because the banks had built up substantial reserves for contingencies and earned surplus. On July 1, 1946, these funds totalled \$32,376,318, as compared with \$8,385,596 on Jan. 1, 1937.

Other Activities—Emergency crop loans outstanding on Jan. 1, 1937, totalled \$104,972,369, and \$105,344,816 on July 1, 1946; drought relief loans \$60,397,062 and \$31,888,495; loans from the Agricultural Marketing Act Revolving Fund \$53,754,384 and \$2,687,057; joint stock land bank loans \$135,353,728 and \$130,406; and regional agricultural credit corporation loans \$25,287,760 and \$3,809,530.

Farm Security Administration

Aid to small farmers through loans and individual guidance became a more permanent part of U.S. agricultural policy with the signing of the Farmers Home Administration act Aug. 14, 1946. This legislation provided basic authority for the program of supervised operating credit conducted by the U.S. department of agriculture on a year-to-year basis after 1937, and enlarged the farm ownership program created by the Bankhead-Jones act of 1937.

Workers' quarters at a Farm Security administration camp for migratory labourers in California, prior to the agricultural labour shortage created by World War II

The government program to assist low-income farmers had been considered temporary and experimental. While the Resettlement administration, an independent agency created in 1935, made small rehabilitation loans to needy farmers, most of its work was developing communities to resettle families farming poor land. The role of individual, on-farm guidance in helping low-income farmers improve their methods had not been fully perceived.

The Resettlement administration was transferred into the department of agriculture at the beginning of 1937, and nine months later became the Farm Security administration; resettlement activities were given a minor place, and greater attention was devoted to aiding the small farmer achieve success in his own locality. FSA was given responsibility for the 40-year farm purchase loans to tenants and sharecroppers under the new farm tenant act, and for water facilities loans in the west under the Pope-Jones act of 1937.

Every farmer who received a loan from FSA was offered assistance by field supervisors in developing and following sound farm and home management plans. Guidance became as important as credit.

When the United States entered World War II, FSA borrowers were able to make substantial contributions to U.S. food production. By 1945, the average farmer active in the rehabilitation program had raised his net worth from \$1,011 to \$2,745 and was operating 176 ac. compared with 111 previously.

Through June 1946, rehabilitation loans were made to about 893,000 families, ownership loans to 41,482 and water loans to 6,957. Repayments were good, and 5,129 long-term purchase loans were completely paid. More than 68,000 World War II veterans had applied for loans; operating credit had been extended to 17,700 of them, and 2,101 had been financed in buying farms.

FSA functions were transferred to the Farmers Home administration Nov. 1, 1946. This new agency of the department of agriculture was authorized to make short-term production and subsistence loans similar to the re-

habilitation loans developed by FSA; these included supervisory services. It was authorized to make 40-year loans for farm purchase, enlargement, development and improvement and to ensure 40-year loans by private lenders for the same purposes. Veterans had preference for the real estate loans and insured mortgages. (D. B. L.)

Farm Tenancy

See Agriculture.

Farouk I

King Farouk of Egypt (1920-), only son and eldest child of King Fuad I, was born at Cairo on Feb. 11, 1920, and succeeded his father on April 30, 1936. In 1935, as H.R.H. Prince Said, he was sent to England to complete his studies; while there he represented his country at the funeral of King George V. His father's death on April 28, 1936, prevented his proceeding to the Royal Military academy, Woolwich, and he returned to Egypt, where a regency council acted for him until his coming of age on July 29, 1937. On that day he was invested as king in the parliament building, Cairo. On Jan. 20, 1938, Farouk married Mlle. Farida Zulficar, daughter of a judge in Alexandria and granddaughter of a former prime minister. Three daughters were born, Princess Ferial on Nov. 17, 1938, Princess Fawzieh on April 7, 1940, and Princess Fadia on Dec. 15, 1943-all being given names beginning with "F," in accordance with a custom begun by King Farouk's father.

Fascism

Fascism is the name for a political philosophy which puts the nation-state or the race, its power and growth, in the centre of life and history. It disregards the individual and his rights, as well as humanity, in the exclusive interest of the nation-state. As a political technique it aims at the maintenance in power of a single party with which it identifies the state. Under its guidance the whole nation is strictly regimented politically, economically and culturally; its form of organization reminds one 'of an army with its stern insistence upon authority and discipline. In its foreign policy fascism extols the sacred egoism of the nation, disbelieves in international cooperation and in the desirability of peace, stresses military virtues and adheres to a strategy of swift and decisive action, scornful of humanitarian scruples, conciliation and compromise.

Fascism was first developed in Italy. Its leader, Benito Mussolini, though proclaiming fascism's unrelenting opposition to Russian communism, accepted many of the techniques and attitudes developed in totalitarian Russia, where one party had seized power, identified itself with the state and regimented the whole economic and intellectual life of the nation to an unprecedented degree. Originally fascism was regarded by Mussolini as an exclusively Italian movement, but in a speech delivered in Rome on Oct. 27, 1930, on the occasion of the eighth anniversary of the march on Rome, he declared: "By the year 1950, Italy will be the only country of young people in Europe, while the rest of Europe will be wrinkled and decrepit. From all the frontiers people will come to see the phenomenon of the blooming spring of the Italian people. . . . Today I affirm that the idea, doctrine and spirit of fascism are universal. It is Italian in its particular institutions, but it is universal in spirit, nor could it be otherwise, for spirit is universal by its very nature. It is therefore possible to see a fascist Europe which will model its institutions on fascist doctrine and practice, a Europe which will solve in the fascist way the problems of the modern state, a state very different from the states which existed before 1789, or which were formed afterward. Today even as yesterday the prestige of nations is determined absolutely by their military glories and armed power. Fascism is an army on the march."

Fascism became of international importance in Jan. 1933, when the German National Socialist Workers party, the principles of which resembled those of fascism, achieved power in Germany under the leadership of Adolf Hitler. Fascism thus gained the backing of the great industrial and military potentialities of Germany. Largely as the result of the ascendancy of fascism in Germany, similar tendencies made headway in Japan, Spain and in a number of smaller countries, so that in the 1930s fascism became a movement of international scope and importance. Among the fascist countries the leadership fell to Germany, Japan and Italy, which at the end of 1937 concluded a pact, ostensibly directed against the Communist international but aimed as much against "decaying" democracy with its "obsolete" and "inefficient" methods. With its great flexibility, expressed in ever-changing decisions of the leader-decisions never discussed but blindly obeyed and immediately executed by all the party members-fascism could present itself in a given situation as a bulwark of the social order against social revolution and Marxism, and in a different situation become the chief propaganda instrument and spearhead of a proletarian world revolution against "reactionaries" and capitalism.

The strength of fascism in the international scene was greatly increased by close co-operation between the leading fascist powers, sometimes regarded as the axis around

Adolf Hitler describing the occupation of Austria in March 1938 at a mass meeting in Munich. Banners about the hall repeated the nazi symbol "one folk, one realm, one leader"

Benito Mussolini addressing Italians at Trieste in 1938. With photographers, as with the populace, he preferred to be viewed heroically, on a balcony above the crowd

which world policy was to revolve. The co-operation of the totalitarian nations was not countered by a similar collaboration of the democracies; they continued to find fault each with the other and to fritter away the opportunities for timely defense in petty jealousies and distrust, instead of visualizing their common interests and their unity of way of life. Thus the world became safe for the aggression of the fascist powers. In spite of their affinity, the fascist powers were primarily influenced by their respective national interests; thus, fascist Germany in 1939 attacked semifascist Poland. which resisted heroically; in 1940 fascist Italy attacked Greece, which under its fascist leader, General John Metaxas, showed itself well prepared for the attack and united for its repulsion.

After 1938 the German form of fascism, known as national socialism (q.v.), became so predominant that it impressed its peculiar character upon all other (and even upon the older) forms of fascism. This was especially true of the acceptance of anti-Semitism by Italian and even Japanese fascism. Japan, with no Jewish population, practically had never had any Jewish problem. The number of Jews in Italy was insignificant; they had been completely assimilated into the national life and had participated prominently in all Italian national movements and wars. Many of them had belonged to the fascist party from the beginning, and for years had been members of Mussolini's inner circle. Official fascist sources had repeatedly declared anti-Semitism an absurdity. But in 1938 Italian fascism suddenly accepted the German racial theory, and quickly surpassed even German national socialism in its vilification of everything Jewish and in its designation of Judaism and Jewish conspiracies as the root of all evil and all troubles. This anti-Semitic trait became especially characteristic of the American form of fascism. The cultural pact concluded in Nov. 1938 between Germany and Italy was regarded as an effort at "training popular mentality along parallel lines in order to make the Italo-German association an instinctive national reaction."

The fascist countries began, after 1936, their ruthless

concentration of all resources of their nations upon vast military programs. By 1938 Germany and Japan could point to great successes. Germany had remilitarized the Rhineland and annexed Austria and the Czechoslovak Sudetenland; Japan had gained the control of central China and occupied Canton, after having successfully reorganized Manchuria as a puppet state and a centre of heavy industry and source of important raw material. Italy alone lagged behind, in spite of the fact that Mussolini had assured his audience at Milan on Oct. 25, 1932, of the coming world leadership of Italy. "Today, with a fully tranquil conscience I say to you, that the 20th century will be the century of fascism, the century of Italian power, the century during which Italy will become for the third time the leader of mankind." Italian help in Spain was unable to accelerate the victory of Spanish nationalist and fascist forces under General Franco over the governmental forces of the Spanish republic. At the end of 1938, Italy therefore raised a demand for a number of French possessions and proclaimed the inauguration of a new period of Italian expansion in the Mediterranean and in the Red Sea, aiming above all at the destruction of the British empire and the gain of the strategic position of Egypt.

The growing international prestige of fascism and the apparent weakening of the democratic front promoted the infiltration of fascist attitudes even into the democracies. Fascist propaganda was relentlessly active not only in Europe, but throughout the western hemisphere. People were induced to believe in the "breakdown" of capitalism and the inevitable upsurge of the "wave of the future." The German and Italian governments devoted special efforts to the organization of citizens of German and Italian descent in the European and American countries, and tried to teach them divided loyalties and even to put their loyalty to their racial origin above the loyalty to the country whose citizens they were. Fascist influence was relatively weak in Britain and strong in France. In the United States the great number of parties and presumptive leaders, and their division into Catholic and Protestant groups, prevented the formation of a strong fascist organization.

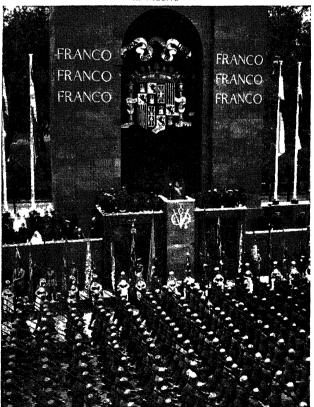

In May 1939 Italy and Germany concluded an outright defensive and offensive military alliance. Influential Japanese circles aimed, in the middle of 1939, at the extension of the military alliance to Japan. The Soviet-German agreement of Aug. 1939 changed the situation and forced a re-orientation in fascist propaganda. Propaganda against communism ceased entirely in Germany and other fascist countries; at the same time communists stopped their hostility to fascism and united with fascists in attacks against democracy, capitalism and "western imperialism." The element of nationalistic collectivism or communism, always contained in national socialism, was now stressed more than ever before. When in Sept. 1939 war broke out between Germany on the one hand and Britain and France on the other, Germany and Russia not only collaborated against Poland, but joined in the denunciation of France and Britain as imperialist plutocracies and regarded them as responsible for the war. Later, President Roosevelt was singled out by fascists and communists as a warmonger. Chancellor Hitler in his proclamation for the new year 1940 and the editorials in the German press called the war an "international revolution" destined to put an end to capitalistic society. The former violent attacks against the "international Jewish Marxist conspiracy" were now replaced by diatribes against "democratic imperialist warmongers" and against plots by "international bankers,"

The Russians were admitted with the Germans to the honour of "young and productive nations to whom belonged the future."

The anti-Comintern pact was replaced by an alliance among the three leading fascist powers concluded in Berlin on Sept. 27, 1940. In this pact, Germany, Italy and Japan united for the common struggle to establish a new world order. This new order, appearing as a great social and revolutionary force, would end the reactionary and conservative "pluto-democratic order." While Germany and Italy charged themselves primarily with the task of establishing the new order in Europe and Africa, and Japan with the task of establishing it in Asia, the new order was intended to become the universal order of mankind. The new pact denied any hostile intention against the soviet union; in fact it was followed by a pact of friendship and neutrality between Japan and the U.S.S.R. in April 1941. The pact of Sept. 1940 was aimed against the United States, upon which nation the violent attacks of fascism became more and more concentrated in 1941. On Oct. 23 of that year, the Stampa of Turin, one of Italy's best known newspapers, depicted Secretary Hull and President Roosevelt as "throbbing with rage as they use phrases from the ghetto from which the latter has descended."

The last international political success of fascism was gained in June 1940, when the defeat of France gave a reactionary and anti-British group under Marshal Pétain, Pierre Laval and Admiral Jean Darlan the chance of seizing power. Democracy in France was officially abolished, and the achievements of the liberal era since the French Revolution were abandoned and vilified. In their place a mixture of the old French pre-revolutionary order and an imitation of German-Italian fascist models was introduced. The fascists tried to prepare for the con-

Francisco Franco reviewing troops during a 1939 victory parade in Madrid

quest of the remaining democracies by spreading intellectual and moral confusion and by breaking or mollifying their will to timely and above all to concerted action. They tried to sow disunity and distrust among the democracies, fulminating against "British imperialism" in the United States, against "Yankee imperialism" in Latin America and warning the British of U.S.' "intention" of liquidating, and partly inheriting, the British empire. Depending upon the audiences for which it was destined. fascist propaganda raised doubts about democracy equally from the rightist as well as from the leftist point of view. The most refined technique of propaganda was coupled with a strategy of terror to produce the desired disintegration of the democracies. After the Spanish insurgent general, Emilio Mola, declared that the conquest of Madrid, which was then still in the hands of the Spanish Republican government and which was being attacked by four columns moving towards the city, would be helped by a "fifth column" of Franco sympathizers within the city, the expression became used frequently to designate the conscious and more often unconscious helpers of totalitarian penetration into the democracies.

The effort to broaden the base of the new order by the adhesion of other nations, although announced with great insistence in the fall of 1940, failed. Only three minor vassal states or protectorates of Germany-Slovakia, Hungary and Rumania-signed the pact. It became clear that the new order was not to be based upon the voluntary collaboration of free and equal peoples, but was to be strictly of a hierarchical nature with the German and the Japanese races dominating and guiding the weaker or so-called inferior races, which were to be disarmed and made economically subservient to the leading races. Rumania, which had been a semifascist country for several years, joined the ranks of fascism openly in the late fall of 1940, when the Iron Guard or the Legion of the Archangel Michael seized power and established a so-called legionary state which began its career by the assassination of a number of the leading conservative statesmen, generals, high officials and intellectuals of Rumania. In Norway at the end of Sept. 1940, Major Vidkun Quisling was imposed by the German forces of occupation as the ruler of Norway, and with the help of his minister of propaganda, Gudbrand Lunde, he quickly copied all the methods of national socialism. In July 1940 Prince Fumimaro Konove of Japan formed a government whose stated task was the building of a new national structure according to the fascist model in which the nation's total power would be regimented for the attainment of the domination of the far east. Under the influence of this fascist trend the Christian churches in Japan were expected to conform to Japan's nationalist and totalitarian ideals. A united party, the Imperial Rule Assistance association, was founded to accomplish the building of the new structure of Japanese life. It held its first three-day session in Tokyo in Dec. 1940, when the chairman of the meeting stressed the unity of Japan with Germany and Italy in the decisive battle between the new fascist order and the democratic way of life.

The heroic defense of Britain under Winston Churchill's leadership, when Britain stood entirely alone in a seemingly hopeless position, marked the turning point in the fortunes of fascism and in the vindication of democracy The Greek victories over the Italian army, the successful organization of China under Chiang Kai-shek, and the successful defense of Egypt and the Suez canal by British

imperial forces which defeated the Italian armies of Libya and Ethiopia, created an entirely new situation. Even the German victories against the Red army in the summer and fall of 1941 could not counteract the impression of the waning power of fascism; yet these successes of German arms which continued throughout 1942 on the eastern front, and the victory of the Japanese over U.S., British and Dutch forces in the far east in the first four months of 1942 seemed to keep the ultimate outcome in the balance. The final break started in the mother country of fascism. The 20th anniversary of the march on Rome and of fascism's coming to power in Italy was celebrated in Oct. 1942 in a very subdued mood. Fascism had always boasted of its superiority compared with "obsolete" and "decadent" democracy, of its higher efficiency and military invincibility. The events proved that fascism, in spite of its many years of preparation and its supreme efforts at total mobilization, was surpassed in the course of only a few years by the democracies, even in the art of warfare, which fascism acknowledged as its most proper domain.

On May 26, 1942, the fascist party directorate in Italy decided to remove all party members "found guilty of unethical conduct in the face of the war emergency." Many party members were dismissed for speculation, black

This shows one of the buts for women and children

market operations and other dishonourable activities. The difficult and almost chaotic condition in which Italy found itself as a result of 20 years of fascist administration was made clear at the beginning of July 1943, when against widespread criticism and unrest Mussolini warned publicly that the Italians must not make scapegoats of the fascist bureaucracy and threatened the most draconic measures against all who would undermine fascist and Italian moiale. But only a few weeks later, on July 25, 1943, the king of Italy dismissed Benito Mussolini and appointed Marshal Pietro Badoglio as prime minister. On July 28 the dissolution of the fascist party was decreed, and the new government announced officially that "Italy has found it necessary to rid herself of a political system that she found harmful to the nation; this political system has been done away with. Fascism in Italy is over, forever." The end of fascism in Italy was welcomed by many Italians, and the new government promised a clean sweep of the Italian national life from all traces of the fascist regime.

The Germans, in occupying northern and central Italy, succeeded in rescuing Mussolini, who had been imprisoned by the Italian government. On Sept. 15, 1943, Mussolini again "assumed the supreme leadership of fascism in Italy." He appointed Alessandro Pavolini provisional secretary of the fascist national party, which was now renamed Republican fascist party, thus expressing the party's hostility to the king and the house of Savoy. In spite of its promises of far-reaching anticapitalistic measures, the

Republican fascist party was unable to win the majority of the Italian working class. Some of its foremost leaders were executed by their former fellow fascists. In Jan. 1944 Count Galeazzo Ciano, for many years foreign minister of Italy and son-in-law of Mussolini, and Marshal Emilio de Bono, one of the original four leaders in the march on Rome, were executed by fascist firing squads in Verona. The military events of the spring of 1945 put an end to the fascist regime in Italy. Benito Mussolini died in an ignominious way. But, after 20 years of demoralization and mental confusion, the seeds of fascism remained. In Italy in 1946 they were mainly represented by L'Uomo Qualunque (The Common Man) a newspaper and an organization founded by Guglielmo Giannini. Though he denied being a fascist, in an interview on Dec. 16, 1945, he used phrases which clearly reflected the general fascist line. He attacked all "professional politicians," including President Roosevelt, who he said, "fooled America for four successive terms." He promised that his movement, the movement of the common man, which, as he hoped, would "spread all over the world," would produce a sufficient number of administrators capable of running Italy. They would remain in office for 20 years and would find "the new word"-the new form of government. He

did not blame fascism or Italy or Germany for World War II but "a handful of a hundred politicians throughout the world." He wished to rid the world of these politicians whom he blamed for the death of his son killed in the war.

According to Giannini, Roosevelt was responsible for taking the United States into World War II, which otherwise would have ended in 1942, apparently with the victory of fascism.

In Germany and Japan the hold of fascism remained strong, even after the Russian victory over Germany at Stalingrad at the end of 1942 and the beginning of the great Russian counteroffensive. Japanese fascists under the leadership of Toyoma Nakano maintained that the Japanese emperor, as a descendant of the sun goddess, was destined to rule the earth as his ancestor ruled heaven, and that Japan could never rest until the whole of mankind became one household under the paternal sway of the Japanese emperor. In spite of this glorification and deification, the emperor had become a mere figurehead and the real power in fascist Japan in 1942 was in the hands of Prime Minister Hideki Tojo, who apparently wished to revive the days of the shogunate. The needs of the war were made an excuse for converting Japan into a oneparty fascist state. The Imperial Rule Assistance association, founded by Prince Fumimaro Konoye, became the

only political party in Japan with the prime minister as its leader.

While fascism remained strong in Germany and Japan, and also in Spain and Argentina, it was weakened by the victories of Russia and the democracies in all other European countries, especially in Rumania and Bulgaria, and in Hungary where in the last minute, with the Russians deep in Hungarian territory, the fascists under Major Ferenc Szálasi, for many years leader of the Arrow-Cross movement, seized power. Throughout Europe, in all countries which had come under fascist control, a general demoralization was noticeable. It showed itself partially in a widespread apathy and partly in the recourse to violence to which years of fascist brutalization and lawlessness had accustomed especially the youth of those countries. Antifascists were often animated by a bitter feeling of hatred against those who had supported the fascist regime. This bitterness almost assumed the proportions of civil war in many cases. After Germany's attack upon the U.S.S.R. in June 1941, members of the Communist parties in the various countries took a prominent part in the fight against Germany, proclaimed a new patriotism and in many cases became the backbone and the leaders of the antifascist resistance movement.

In Spain the fortunes of war led to less open emphasis on the fascist character of the government, but the falange and its ideology continued to dominate the political and social manifestations of life. The falange and the leading group in Spain dreamed of restoring the old Spanish empire in its greatest expansion, including even Cuba and Puerto Rico, Texas and California, Panamá and the Philippines. Like their counterparts in Germany and Spain, the militarists in control of Argentina began to dream of Argentina's expansion, a lebensraum which would include the mineral wealth and the Pacific coast of Chile, and the neighbouring lands of Paraguay, Bolivia, Uruguay and the southern provinces of Brazil. Such a state would be in a strategic position and economically strong enough to claim the leadership of all Latin America and to oppose its policy to that of the United States in deciding the fate of the western hemisphere. The Argentine government proceeded step by step to follow the example set by other totalitarian countries in winning over the masses by socialist promises, and in kindling national pride by inflaming the imagination with alleged "imperialist" and "reactionary" threats to Argentine sovereignty and security. On Nov. 17, 1944, vice-president and minister of war Colonel Juan Perón decreed the "organic law of the army," introducing the duty of all male and female Argentinians from 12 years of age onward to prepare for the defense of their fatherland. All males became subject to pre-conscription training from 12 to 20, and then for 30 years to military duties. Girls were to be prepared from the age of 12 for various women's auxiliary services. In the spring of 1946 Perón was elected president of the Argentine republic. He represented the Argentine labour party and was elected largely through the support of the masses, to whom he promised far-reaching social reforms and the fight against capitalism, especially against North American plutocracy.

Fascist influence underwent a definite eclipse in South Africa. The Ossewa-Brandag, or "Covered-Wagon Sentinels," an extremist Boer organization which was violently anti-British and pro-fascist, was curbed. Similar Boer groups, which had opposed South African participation in the war and were violently hostile to Britain, united into

one party under Dr. D. F. Malan for the elections of July 1943, but suffered "the most spectacular deteat in the history of South Africa" when the democratic parties under the leadership of Field Marshal Jan Christiaan Smuts gained a majority of 64 seats as against only 13 voices with which Smuts had carried his declaration of war against Germany in Sept. 1939. This defeat of the anti-British party in South Africa, perhaps the strongest and most effective fascist party in any democracy, confirmed the general trend away from fascism which predominated in the world after 1942, and to which only the governments in Spain and Argentina formed, in 1946, an exception.

The victory of the United Nations in 1945 ended the grip of fascism over Germany. Adolf Hitler and Josef Goebbels disappeared amid the ruins of Berlin in the catastrophe of a Germany which they had hoped to make the most powerful nation on earth and which they succeeded in destroying completely. Prominent fascist leaders were tried as war criminals in Germany and many other countries, and a number of them were executed. The fascist governments in Rumania, Bulgaria and Hungary gave way to governments in which communist forces asserted leadership. Democratic governments were established in Austria and in Italy. Germany did not survive defeat as an organized nation. (See also Anti-Semitism; CIVIL LIBERTIES; COMMUNISM; DEMOCRACY; GERMANY; ITALY; JAPAN; NATIONAL SOCIALISM; PHILOSOPHY; RUMANIA; SPAIN.)

Fashions, Women's

In describing any phase of life in the eventful decade 1937–46, it is necessary to note that this was a most abnormal period, with all its trends sharply influenced or directly traceable to the cataclysmic war which occupied some six years of the ten. The fashion phase proved no exception. Paris, long the source of inspiration, disappeared into the nazi darkness along with the rest of Europe. London had to give its entire attention to the blockade, the blitz, the buzz bomb, not to the hang of a woman's skirt. Only the United States couturier could function with any degree of normality, and even there restrictions on fabric as well as radical changes in the feminine way of life put considerable restraint on the imaginative designer.

Silhouettes.—Silhouettes showed no remarkable variations from 1937 until 1945. The natural kind of line which prevailed just before World War II—following fairly faithfully the contours of the human figure, with the waist pretty much where it should be and without the padded, exaggeratedly wide shoulders so popular before 1937—continued to prevail until well after V-E day. Regulation L85, limiting yardage in U.S. women's clothes, had a great deal of influence in this respect. Then, in 1945 out of renascent Paris, there emerged a complete new trend toward roundness. Shoulders and sleeves were padded to curve outward in big arcs, waists tightened to curve in.

Below: Molyneux's peasant dirndl suit of 1938

hips belled out by much padding and pleating. By the end of 1946, however, this roundness was already in its decline, the shape of things to come still in a state of flux.

Hemlines on silhouettes were a bit more active during 1937-46. They crept up slightly on daytime dresses in 1940; the U.S. had just taken over most of the world's designing, and U.S. women still liked to show off their famous legs. Then in 1941 came a real innovation. The autumn collections produced, and the public finally accepted, the ballet-length evening dress. Six or eight or even ten inches above the floor, these put a new emphasis on foot and shoe. The next hemline change came after the close of the war in the spring of 1946, with a whole crop of uneven hemlines, some dipped low in back, some jagged, some slanted low at one side.

Suits came close to establishing themselves as the number one fashion of the decade, because of the war. What was formerly a costume for tailored days in town or a country sojourn became a uniform for 24 hours a day, 7 days a week, everywhere. Women in defense jobs or campfollowing their husbands around the country found one suit worth a half-dozen dresses-as right at a Texas airfield as on the sidewalks of New York, and infinitely variable by means of blouses and jerseys. The suit itself took to many forms and fabrics. Jackets were classic cuts, or boleros, basques, box shapes, lumberjackets, snappy brassbuttoned bellhop tops. Skirts were knife-straight, flyfronted, trouser-pleated, or fulled slightly in front. And gray flannel had a particular heyday. Only with the war's end and the consequent reaction against all things that smacked even remotely of the sensible, did women tire of suits. The winter of 1946 brought full-length coats worn over wool dresses as a replacement for suits, but it would be a long time before suits relinquished the prominent place in the wardrobe that they gained during the decade. They were winning back lost popularity with cutaways and tunic-type jackets that reached almost to the middle of the thigh.

Coats were strongly influenced in shape by the demand for suits. And the shape for fur and cloth alike was big, roomy, often chunky. The Chesterfield, a boxy full-length coat with a small velvet collar, had a long vogue. So did the fingertip-length coat, cut loose and swingy to contrast with a sheath dress or absorb a bulky suit. So did the Canadienne, the French translation of the Canadian soldier's belted three-quarter coat. Minor flurries of trench coats, greatcoats and pea jackets were observed; and in 1943, the square-cut fur-lined wool coat arrived importantly in many different lengths. In 1946, however, the important trend was toward redingotes and reefers, coats that went slickly over the feminine dresses which had become the fashion.

Dresses, after succumbing to the influence of the Austrian dirndl for a while, began early to become slim, tubular, reedy. Cut straight, cinched in at the waist by belt and not by fit, they made a maximum of a minimum of cloth. Gradually, high round "jewel" necklines changed to turtlenecks and scooped-out ovals, and sleeves shortened into ledges or little caps or disappeared completely into shoulder straps and halters. Dresses of this latter bare-topped variety usually came equipped with boleros and jackets, turning them into modest suits for the office, restaurant or theatre. With the introduction of the rounded-out line in 1945, however, all this changed. Dresses featured swelling curves; dolman sleeves became the rule, as did big Peter Pan collars or tiny-collared, round-yoked

tops. Two fabrics used prominently in dresses were silk jersey, introduced in 1937, and cotton, which was given the same elegant treatment as silk during the war and was worn night and day.

"Separates," something new and characteristically U.S. in fashion, often substituted for dresses. These were outfits of several pieces—skirt, jacket, shirt, halter, long skirt—which could be combined and varied in numberless ways, making costumes for any and every occasion.

Evening Clothes completed a cycle during the decade. The prewar period saw dresses at their most romantic and opulent, made of many yards of rich fabric, copied from Winterhalter paintings or the Spanish masters, swung out -for a brief vogue-by hoops. With the first signs of war, however, they entered another stage. Slim and straight of line, some had covered shoulders or pailletted jackets, others were shirtwaist tops above simple skirts. Wool was often used in dinner dresses, decidedly new and a definite necessity in heatless houses. Then, with the decrease of lavish parties and the restricted use of taxis and private cars, the floor-length dress disappeared almost completely. The new ballet-length dress and street-length ones of charming cut and cloth took its place. Covered up at first, these gradually assumed full décolletage; a short slipper satin dress held up by thin shoulder straps, a short black crepe skirt topped by a sequinned halter. War's end saw the end of the cycle. The first long evening dresses to appear were simple black velvet pinafores. Later came sumptuous creations of satin and brocade, stiff with beads and embroidery, boned and padded. The elaborate short dress continued, however, as a favourite for "little" evenings.

Play Clothes grew into a bigger fashion category each year of the decade, with one important trend crowding out another. It began with gray flannel man-tailored slacks—the duchess of Marlborough had bought the first from a gentleman's tailor. The next year, 1938, saw the bare midriff play dress come into being; considered daring then, it became the accepted and attractive silhouette for beach and country. Other big successes included frontier pants, dirndls, pinafores, denim shorts and skirts and jeans, leotards (to wear under skirts) and cholo coats (to wear over swim suits). Bathing suits slimmed down from the ballerina type of 1938 to the skin-tight panungs of 1945 and 1946 (based on the loincloths of the South seas), and embraced every cloth from gingham to wool gabardine.

Shoes staged their own revolution between 1937 and 1946. Women, while appreciating and envying the comfort of low-heeled shoes, had always resented their heavy "sensible" look. Then suddenly, inspired by the success of espadrilles and peasant sandals and the growing popularity of suits, flats (for so they came to be known) began to put on new airs. They acquired a light-footed look, a cut and crafting every bit as pretty as the kind given to spikeheeled pumps. They were soft suede slippers, little leather sling-backs, ankle-high boots, and ballet slippers of all colours and materials. (The latter, in 1945, became a real craze.) Wedge shoes also grew into an important fashion during the decade. So did the ankle-strap shoe, when short and ballet-length evening dresses threw the emphasis on ankles. As for other high-heeled shoes, these continued to feature cut-out toes and heels until 1946, when the closed pump had a renascence.

Hats swung with the pendulum of the times. Crazy and frivolous before 1939, covered with flowers and wearing coquettish veils, they quieted down when war came. Snug-crowned felts, skullcaps and cloches came into being to accompany the ever-present suits. Hoods, which the

1938 ski rage had made into a big millinery fashion, grew more popular than ever, being warm and adaptable to the current neat-headed coiffures. Then, in conformity with the rounded-out line which came from Paris' first postwar collections, big swooping rollers, huge globes of felt and lush *Directoire* bonnets became the style. The trend continued "pretty," with a sprinkling of rakish berets and visored caps.

Hairdos had their ups and downs, according to the fashions which were prevalent. The decade saw: the long mane (1937), the page-boy (1938), the George Washington coif (1938), the feathercut or shortcut (1939), the chignon (1943), the upswept hairdo and the Psyche knot (1946), and a shorter, neater caplike head of hair (1946). Many of these persisted. In 1946, Paris was dictating a trend toward more elaborate coiffures, involving false hair, false chignons and false braids.

Accessories grew to great importance during the decade. The slickly simple fashions which were characteristic of the U.S. wartime couture depended to a large extent on what went with them—a yellow scarf muffling the throat of a gray flannel dress or knotted round its waist, a ponyskin bag enlivening a black greatcoat, a wide band of brass-studded leather pulling together a plain gray flannel shirt and skirt. Belts had tremendous popularity; they came in many different shapes and leathers, and were usually plastered with brass ornaments. The over-the-shoulder handbag also made fashion history right after the start of the war; good with suits, it left the hands free to do other jobs. String gloves, cotton or wool, short and gay-coloured, were another strong fashion.

The over-all picture showed two important happenings during the decade. First, the emergence of a strongly individual U.S. design, forced to maturity by the war, one which produced a whole U.S. kind of look, and was managed most successfully to meet both the demands of mass production and individual taste. Second, the emergence of important new fashion markets. It was evident in Paris that the U.S. was no longer the catered-to customer. South Americans and Italians were among the groups which had the money and mode of life and the interest and inclination to be patrons of fashion's art. (See also Furs.)

Federal Bureau of Investigation

By the end of the 1937 fiscal year most of the U.S. gangster barons who ruled in the earlier '30s had been incarcerated. Their reign of terror was broken.

Of major importance in the work of the Federal Bureau of Investigation during that year was the smashing of several large and well-organized white slave traffic rings throughout the U.S. The FBI National academy had graduated a total of 115 officers representing 45 states and 1 territorial possession. During the fiscal year the FBI laboratory conducted 6,644 examinations of evidence. In 897 of these examinations assistance was rendered to other branches of the federal government as well as to state, county and municipal law enforcement agencies. The identification division of the FBI had 7,360,458 sets of fingerprints on record. During the year, 487,621 identifications were made and 6,223 fugitives were located through fingerprints.

There were 4,624 convictions recorded for the year. These resulted in 2 death sentences, 12 life sentences and 13,345 years, 7 months and 29 days, and fines amounting to \$648,359.80. Recoveries effected in cases investigated by the FBI amounted to \$4,905,459.40. There were 2,635 motor vehicles recovered during the year having a value of \$1,157,947.81. Savings realized, fines imposed and recoveries effected in cases investigated by the FBI during the fiscal year reached a total of \$41,438,370.22.

Among the cases occurring in the 1938 fiscal year were several of outstanding interest. A confidence man who used 79 different names and cashed 317 checks totalling \$12,798.29 in 35 states was indicted, prosecuted and sentenced to serve a term exceeding 14 years.

Another man, obsessed with the desire of colonizing a South sea island, attempted to carry out his plans. After engaging a boat under the guise of wanting to take a short cruise, he set out for the South seas, forcing the seven members of his party to act as the crew under the persuasion of a .45 calibre automatic pistol. His plan failed when he was killed and his body was thrown overboard by the crew. In Kansas City 242 persons were convicted for election frauds. For the 1938 fiscal year there were 5,420 convictions resulting in 3 death sentences, 13 life sentences and 16,604 years, 3 months and 6 days. Fines, savings and recoveries amounted to \$47,568,419.53.

By 1938 crime was not the only field of activity engaging the attention of the FBI. Investigation disclosed extensive and widespread activities directed by agents of a foreign government. It was determined that these agents were actually engaged in securing secret information pertaining to the U.S. military and naval forces for delivery to a foreign power. As a result of this investigation four espionage agents were apprehended, prosecuted and convicted.

The fiscal year 1939 brought with it a great increase in investigative work in espionage and related fields. There were 1,651 new cases investigated as compared with 250 cases during the previous fiscal year. Exclusive jurisdiction over this type of case was given to the Federal Bureau of Investigation by presidential directive. While prosecutions in this field were relatively few at this time, a tremendous amount of investigative time was devoted to ascertaining the identity, movements, operations and contacts of persons allegedly engaged in espionage activity. At the same time numerous and extensive investigations were conducted in cases of alleged sabotage in connection with the manufacture of war materials, munitions and supplies.

This same fiscal year saw a number of notable cases in

the criminal field reach their logical conclusion. One of the most notorious criminals in the U.S. was taken into custody in New York city. This man and his associate were believed to have been interested in the operation of dog tracks and slot machines throughout the country. They were also said to have been the New York contacts for the notorious Barker-Karpis gang, the kidnappers of Edward George Bremer, and for Verne Miller and his associates. Miller, together with Charles "Pretty Boy" Floyd and Adam Richetti, perpetrated the infamous Kansas City massacre. The main sources of revenue, however, for this criminal and his associate were the so-called rackets operated in New York city, which under their management threatened to become a permanent parasite on industry. Through their own organization of strong-arm men and gunmen, which was believed to number from 200 to 500, they collected millions of dollars from legitimate businessmen in the city of New York.

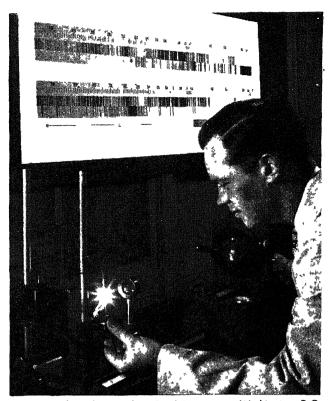

The last remaining member of what could well be called one of the most notorious and successful gangs of bank robbers of all time, was sentenced to an additional five years, making his total sentences 26 years. A vicious killer who in May 1946, killed at least one and wounded 13 other guards in an abortive attempt to break out of Alcatraz prison, was arrested by special agents of the FBI in Chicago, Ill. For the first time since the judicial system was set up in the federal government, an appellate judge was charged with selling his office to those who came before him seeking justice. On April 26, 1939, a federal grand jury in New York returned an indictment against a former judge of the circuit court of appeals. The investigation of this case led to the first conviction of a federal appellate judge in U.S. history.

During the 1939 fiscal year the use of microchemical techniques was applied in the FBI laboratory to the analysis of evidence. These techniques served both to check and supplement spectrographic analysis in that once the qualitative determination was made spectrographically, a quantitative analysis could be performed microchemically. In the field of blood chemistry notable strides were made in building up standard sera supplies. The collection of ready-prepared sera for criminological purposes was the most extensive in the world. During the year 5,559 scientific examinations were conducted in the laboratory involving 39,037 specimens of evidence.

For the fiscal year ending June 30,1939, there were 5,162 convictions in cases handled by the FBI with 12 life sentences and 16,948 years, 6 months and 5 days being imposed. The total savings, fines and recoveries for the fiscal year amounted to \$16,876,717.99.

Internal Security of the U.S.-By this time it was recognized that investigations relating to national defense matters should be conducted in a comprehensive and effective manner on a national basis, and all information should be carefully sifted out and correlated in order to avoid confusion and lack of responsibility. The president of the U.S. in a directive dated Sept. 6, 1939, designating the FBI as the clearinghouse and co-ordinating agency for all matters bearing on our internal security, stated in part: "To this end I request all police officers, sheriffs and all other law enforcement officers in the United States to promptly turn over to the nearest representative of the Federal Bureau of Investigation any information obtained by them relating to espionage, counterespionage, sabotage, subversive activities and violations of the neutrality laws." The response of all law enforcement to the chief executive's request was enthusiastic throughout the nation.

At the request of the war and navy departments, a sur-

Spectrograph analysis in the F.B.I. laboratory at Washington, D.C. Precision instruments and special cameras are among the means used by technicians to record macroscopic and microscopic evidence for court use

vey of the protective facilities of manufacturing establishments having large contracts to provide the government of the U.S. with defense materials was inaugurated by the FBI. In all a total of more than 2,300 such plants were surveyed under this program and recommendations were made to plant officials designed to maintain a maximum of protection.

The citizens of the country by 1940 were becoming more and more aware of the effects of the European conflict upon the nation. An air of tension began to manifest itself in the everyday business life. The day-to-day gossip increasingly included discussions of the progress of the axis powers. Incidents that a year previously meant little took on an added significance. During May of 1940, in one day the FBI received 2,871 complaints. From July 1, 1939, to June 30, 1940, a total of 16,883 national defense matters were received which required investigative activity.

As a result of the 58 convictions in national defense matters during the 1940 fiscal year, sentences totalling more than 65 years were meted out and fines of \$329,860 were levied by the courts. In addition, there were 5,605 convictions in general criminal matters coming within the jurisdiction of the FBI. These resulted in sentences exceeding 17,833 years and 10 life sentences. The total fines, savings and recoveries in these latter cases amounted to \$58,390,180.64. There were 2,393 federal fugitives from justice located and apprehended during the year, while 7,809 fugitives were located for state, county and municipal law enforcement agencies by searching for their finger-prints through the files of the identification division.

The acceleration of the national preparedness program and the ever-increasing recognition of the need to render full protection against subversive activities now began to

tax the facilities and personnel of the FBI to the utmost. During the fiscal year 1941, a total of 68,368 national defense cases were received. In addition 20,305 Selective Training and Service act cases were pending investigation. In this fiscal year there were 412 convictions in national defense cases. Moreover, numerous persons were expelled from the country as a result of information developed by the FBI. The criminal matters coming within the investigative jurisdiction of the FBI continued to demand close attention. For this fiscal year investigative activity in all fields resulted in 6,182 convictions with sentences of over 16,646 years and 5 life sentences.

In the early part of 1941, the FBI Law Enforcement Officers' Mobilization Plan for National Defense was established to afford instruction in the particular investigative problems arising out of espionage, sabotage and similar matters. Through the medium of quarterly conferences held throughout the U.S., Hawaii, Alaska and Puerto Rico, representatives of co-operating law enforcement agencies were kept apprised of the developments in their respective communities. As a result of these conferences, procedures were developed whereby the energies and facilities of every agency were fully mobilized for defense of the home front. This co-ordination served to avoid the confusion prevalent during World War I, when many government and private groups acted independently and often unwisely in the national defense field.

As a further aid in protecting U.S. defense industries, a confidential booklet was prepared by the FBI incorporating the basic principles of protection against espionage and sabotage. This was distributed to plant officials, law enforcement officers, public utilities, railroads, air lines and steamship companies. Representatives of the FBI were sent to England to study police duties and internal security matters under actual wartime conditions. The benefit of the knowledge thus obtained was given to special agents of the FBI and to police officers throughout the nation for their assistance in adequately and properly performing their duties incident to the emergency.

On Feb. 25, 1941, a foreign agent was taken into custody for violation of the Registration act. This man, a very active participant in many German societies in the U.S., recruited German nationals in the U.S. who were skilled mechanics and technicians for the purpose of having them return to Germany to work in plants producing defense articles and war materials.

Two German and 28 Italian vessels became interned in United States ports after the outbreak of hostilities in Europe between the United Kingdom and Germany and Italy and as a result of the British naval blockade. In March 1941, after learning that acts of sabotage had been committed on most of these vessels, their crews were removed and made subjects of deportation warrants. Investigation by the FBI revealed that the engines, turbines, boilers and other machinery of all of the vessels except two had been badly damaged by crew members, and prosecution was instituted against the masters of the vessels and the participating crew members.

In anticipation of coming events and to meet the everincreasing obligations it was called upon to assume, FBI personnel was increased almost twofold. It was realized that in the event of war the FBI must have an organization which would function smoothly and that each employee must be able to step into his or her place immediately so valuable time would not be lost. The entire training program for both special agents and all other employees was geared to accomplish this purpose.

Pearl Harbor and After.—The attack on Pearl Harbor on Dec. 7, 1941, therefore found the FBI completely mobilized on a wartime basis, and it went into action at once to safeguard the nation against internal trouble from U.S. enemies. Immediately after word of the bombing of Pearl Harbor was received, the entire service of the FBI was put on a 24-hour basis, all annual leave was cancelled, and within an hour every employee was at his post of duty ready and able to put into practice the thorough training he had received.

Protective guards were established at the Japanese embassy and all Japanese consulates throughout the country. The same action was taken in connection with the German and Italian embassies and consulates upon the declaration of war against these countries. Appropriate steps were taken to protect all commercial air lines from sabotage by any air traveller or through any air express package. All industrial concerns having war contracts were immediately instructed by representatives of the FBI to be on the alert for any acts of espionage or sabotage or interference with the production of war materials. Instructions were issued to stop all press services to the countries with which the U.S. was at war. All overseas telephone communications into or out of the U.S. were stopped and the departure of any axis national from the country was prevented. Prior to the outbreak of war all enemy aliens who were considered dangerous to the internal security of the country in the event of war had been catalogued by the FBI and their custodial detention recommended to the attorney general. Concurrently with the declaration of war against Japan, Germany and Italy, the enemy aliens of these nationalities who were considered dangerous to national security were taken into custody.

From July 1, 1941, to June 30, 1942, 218,734 national security matters were reported to the FBI for investigation. The principal objective in these inquiries was the prevention of espionage and sabotage or any other activity which might endanger or impair the war effort. While prosecutions in federal courts during the fiscal year ending June 30, 1942, resulted in 1,473 convictions for violations of national defense statutes, these were not the measure of effective intelligence work. From the inception of the emergency the FBI followed the policy of ascertaining the identities of axis agents within the country, their sources of information and methods of communication. Thus it was possible in many instances to gain control of their sources of information and communication methods completely and by so doing to immobilize groups of foreign agents.

For the 1942 fiscal year convictions in FBI investigations in all categories totalled 7,448 with sentences imposed of 1 death, 8 life, 17,163 years, 6 months and 4 days. There were 3,827 federal fugitives located and apprehended and 7,506 fugitives were located for state, county and municipal law enforcement agencies through fingerprint records in the FBI identification division. Fines, savings and recoveries totalled \$17,732,881.45.

Close co-operation and a free interchange of information pertaining to national security were maintained between the military and naval intelligence services and the FBI. Weekly conferences between the officials in charge of these three services resulted in the close co-ordination of all endeavours. In addition, weekly conferences were held by the field representatives of these agencies throughout the U.S. to unify all efforts.

Private citizens individually and through patriotic organizations also co-operated. There were no vigilante

groups such as existed in World War I. By public education, hysteria and gossip were held to a minimum. City, county and state law enforcement officers rendered meritorious service by being constantly alert to recognize and to assist in the handling of any matter inimical to the welfare of the nation.

This fiscal year also witnessed the sentencing of the members of two of the largest German espionage rings operating in the U.S. On Jan. 2, 1942, the members of the Frederick Joubert Duquesne spy ring were sentenced to a total of 320 years' imprisonment and fines of \$18,000. On March 13 and March 20, 1942, Kurt Frederick Ludwig and eight of his cohorts were sentenced to a total of 132 years in prison. Ludwig, born in the state of Ohio, travelled over much of the U.S. securing information concerning the movement of ships, the construction of aircraft, the identity, location and number of troops in various garrisons of the U.S. army and other information pertaining to U.S. defense activities for his German principals. In the general criminal field in addition to hundreds of other cases investigated, one of the most elusive, ruthless and dangerous outlaws ever sought by the FBI was killed while resisting arrest by federal, state and local officers.

Highlighting the national defense activities of the fiscal year 1943 which began on July 1, 1942, was the culmination of the case involving eight submarine-landed German saboteurs. By an executive order of the president of the U.S., the eight saboteurs were tried before a military commission composed of seven U.S. army officers appointed by the president. On Aug. 8, 1942, six were sentenced to death, one to life imprisonment and one to 30 years' imprisonment.

The landing of these men was the first outward manifestation of the intention of the German high command to engage in sabotage activities in the U.S. Within two weeks after their landing they were taken into custody by special agents of the FBI. Thoroughly trained by the high command of the German army in the most modern methods of destruction, the saboteurs were sent to the U.S. for the specific purpose of interfering with the war effort, with particular emphasis being placed on interrupting production at aluminum and magnesium plants. Each man had been born in Germany but at one time or another had spent a part of his life in the U.S., during which time he had learned the English language and acquainted himself with U.S. customs. To carry out their mission they brought with them four waterproof cases containing large quantities of high explosives, bombs which were designed to look like large pieces of coal, a considerable number of different types of fuses, detonators and primers, as well as mechanical and chemical timing devices. It was estimated that the explosives and other equipment furnished these men when utilized in connection with their training in preparing additional explosives and incendiary material would last the saboteurs two years. At the time they were apprehended by the FBI, \$174,588.62 of their funds was seized. In addition to this equipment and money the saboteurs were furnished with forged Selective Training and Service act registration cards, and social security cards made out in the names of the aliases they expected to use.
